We can refer only to the outline of their progressive application to the facts of human mortality. Guesses at the probable length of life for the purpose of valuing or commuting life-estates, leases, or annuities were indeed made even by the ancients, and crude estimates of the number of years' purchase such interests are worth occur in Roman law and in many mediæval writings. In 1540 Parliament enacted that an estate for a single life should be valued as a lease of seven years, one for two lives as a lease of fourteen years, and for three lives as a lease of twenty-one years. More than a century later *The Cambridge Tables for renewing of Leases and purchasing Liens*, a standard work in England, with the certificate of Sir Isaac Newton to its accuracy, proposed, as a remedy for the inequity of this fanciful rule, to make the increase for each additional life less by one year, so that, valuing a single life at ten years, two lives shall be reckoned as nineteen years and three lives as twenty-seven years. No distinction of ages was recognized, and the results, tabulated to decimal parts of months, are of course worthless. Thus the foremost minds of the world had as yet no apprehension of a true method of reasoning on the subject. The first clear insight into the character of the problem appears in *Natural and Political Observations on the Bills of Mortality*, published in 1661 under the name of John Graunt, a haberdasher and train-band captain of London. Graunt recognized the principle of uniformity in large groups of vital and social facts, and actually prepared, from the mortality registers of London, what he calls a "Table showing of one hundred quick conceptions, how many die within six years, how many the next decade, and so for every decade till 76." This was the earliest crude suggestion of a table of mortality, and Graunt's interest in the inquiry was scientific, without definite practical purpose. But a little later the sale of annuities was pressed upon Governments as a method of discounting future revenues. In 1671 John De Witt, Grand Pensionary of Holland, reported to the States General a plan for such sales upon a scientific method, the insight and skill of which, had he possessed proper statistical data, would have anticipated results only reached by later generations. The report, however, was buried in the Dutch archives and forgotten for nearly two centuries. It was unknown in England when, in 1692, the Government undertook the sale of annuities. A loan of £1,000,000 was offered, each £100 paid in to purchase a life annuity of £14, without distinction of age. A table accompanied the offer, purporting to show how many of 10,000 persons now living, old and young taken together at random, are likely to die in each year from one to ninety-nine. Of course the purchasers, though without clear understanding of the principle, were instinctively shrewd enough to select healthy young lives for annuitants, and the nation paid enormously for the error. This speculation of the public treasury led the eminent mathematician and astronomer Dr Edmund Halley to

History.

examine the subject. In 1693 he presented to the Royal Society a study of "The degrees of mortality of mankind." The parish registers of England took no note of age at death, and Halley, perceiving that the average duration of life in large groups of persons can only be determined when ages at death are known, sought in vain a statistical basis for such an inquiry in his own country and in many others. But it happened that the city of Breslau in Silesia had kept such records, and he succeeded in obtaining the registers for five years, 1687–91, including 6193 births and 5869 deaths. No census of the city having been taken, he made the best estimate he could of the population, and computed how many of a thousand children taken at the age of one year will die in each succeeding year. Arranging the results in three parallel columns, showing in successive lines the age, the number living at that age, and the number of deaths during the year, he formed the first mortality table. The arrangement was itself a discovery, exhibiting at a glance the essential data for valuing life-risks, and suggesting solutions for problems which had puzzled the ablest students. This general form of the mortality table remains in use as the natural and best for such collections of facts. The method of using such a table in calculating the values of life contingencies was also discovered by Dr Halley. He showed that where a payment is to be made at a future date, if a named person be then alive, its present value is the sum which compounded at interest during the interval will amount to that payment multiplied by the fraction representing the probability that the person will survive. These two elements, compound interest and the probability of life or death, are the foundations of the theory of life contingencies.

Halley's Table.

From Halley's time the progress of the theory has been in three directions: first, in accumulating facts from which averages are deduced, and analysing the data so as to eliminate disturbing influences, that is, in constructing trustworthy tables of mortality; secondly, in extending the inferences from such tables, and multiplying their applications to needs of practical life; and thirdly, in facilitating the calculations which these applications require, the enormous labour of them being beyond human capacity until the highest mathematical skill has devised means of shortening them. But while Dr Halley thus firmly and lastingly drew, in outline, the theory of life contingencies, the numerical results attained by him were grossly imperfect. Forced by the lack of data to assume that the population was stationary, and to rely on a rude estimate of its numbers, he well knew that his conclusions were but provisional. Yet they were far in advance of the general mind of his time. As late as 1694, and even in 1703, Parliament substantially re-enacted the old law for valuing leases at seven years for each life. The meagre Breslau Table long remained the only serious attempt to utilize actual observations of mortality for scientific purposes. In 1746 de Parcieux, a mathematician of Paris, published an *Essai sur les Probabilités de la Durée de la Vie Humaine*, in which he presented mortality tables formed by himself, one from the records of certain Tontine associations, and five others from those of several religious orders in Paris. The Tontine experience table was a much closer approximation to the true course of mortality, as shown by later investigations, than any of its predecessors, and indeed now appears, despite the crude manner in which the materials were treated, to have been more accurate and more trustworthy than the Northampton or even the Carlisle Table of much later date. The essay of de Parcieux was an important source of information to advanced students in France and Germany, but attracted no general or popular interest, nor was it followed up by progressive researches of the same character in continental Europe, while it remained almost unnoticed in England.

Throughout the 18th century the customary treatment of life annuities was as chaotic and fanciful as before, though some writers of eminence, most notably Dr Thomas Simpson of London (1752), treated the theory of the subject with great intelligence, and in 1753 Dodson of London (great-grandfather of Dr A. de Morgan) projected a life insurance company in which the premiums should be accommodated justly to the ages of the insured. But life insurance as a business really began with the Equitable Society of London, founded in 1762. The associates petitioned for a charter, but the law officers of the Crown refused it, saying that the scheme depended for success on the truth of certain tables of life and death, "Whereby the Chance of Mortality is attempted to be reduced to a certain standard. This is a mere speculation, never tried in practice." The society was organized as a voluntary association, and began business in 1765. Its premiums were computed from the Breslau Table, with some corrections from the London Bills of Mortality, and were far higher than any now in use. But the managers, in face of actual business, needed more light. Dr Price, a student of the new science of life contingencies, was consulted, and soon devised tests of the society's experience and measures of the financial results, which are in principle those still practised. He also aspired to construct a more accurate table of mortality, and discovered data in certain parish registers of Northampton which promised to represent the average of life in England. From these he formed in 1780 the Northampton Table of Mortality, and computed a new and largely reduced scale of premiums for the society. The historical importance of the Northampton Table lies in the profound impression it made on the general mass of intelligent mind, spreading widely the new conception of a regular death-rate of population, to be determined only by observations classified according to age. The crude state of previous knowledge on such subjects is hard to realize. Although mortality had long been recognized by special inquirers as a promising theme for statistical inquiry, its actual treatment, except in the narrow school founded by Süssmilch in Germany (1746), and in the isolated and almost prophetic work of de Parcieux in France, had been speculative and vague. De Moivre handled it with mathematical acuteness, but framed his scale of mortality (about 1750) on a hypothesis of his own, not on known facts. Out of each group of eighty-six deaths, according to this scale, one dies on the average each year till all are gone; so that x being the present age, the probability of death within a year is always $\frac{1}{86-x}$. This conjecture, which, during middle life, served as a rough approximation to the truth, almost as well as some of the early tables of repute, long found remarkable acceptance among men of science as a discovery. Dr Price's researches first brought to general apprehension the conviction that a large basis of observed facts is the only source of real knowledge. The Government of the day felt the influence of the movement. In 1786 Mr Pitt, then Chancellor of the Exchequer, consulted Dr Price on plans for the conversion of debt, and in 1789 the Government first showed knowledge that in granting annuities ages must be distinguished, and that the prospective life at ninety and that at twenty-five are not to be estimated as equal. About 1808 a conversion of 3 per cents. into annuities was planned. The Northampton Table was adopted, and Mr Morgan computed rates from it which were used for twenty years. It proved to represent a mortality far in excess of the average, and in

Northampton Table.

1821 Mr John Finlaison, being made Actuary to the Debt Commissioners, protested against the rates in use. But the Government was slow of conviction, and not until 1828, when the Treasury had lost two millions of pounds by selling annuities too cheap, was the law repealed. Mr Finlaison then constructed a new and less wasteful scale of conversions, but singular results followed. At the age of ninety, for instance, £100 would purchase an annuity of £62. Combinations were formed to purchase annuities on the lives of old people selected for their vigour; 675 of these were taken, with a further loss of at least a million to the Treasury. The Northampton Table, in fact, like the earlier Breslau Table, was formed without a census, and upon the false assumption that the population was stationary. Dr Price's estimate, founded on the recorded baptisms, was much too low, many of the people being of a sect which rejected infant baptism. His table represents an average life of twenty-four years, whilst subsequent inquiries indicate a true average of about thirty years at that time in the same parishes. The actual mortality in the Equitable Society proved to be less by one-third than that anticipated by the table. The error had consequences of vast moment. The immediate and dazzling prosperity of the societies founding rates on this supposed scientific basis excited the public imagination, stimulated the business exceedingly, and led to many extravagant projects, followed by fluctuations and failures which impaired its healthy growth and usefulness.

In spite of gross defects, the Northampton Table remained for a century by far the most important table of mortality, employed as the basis of calculation by leading companies in Great Britain, and adopted by the courts as practically a part of the common law. Parliament, followed by some state legislatures and many courts in America, even made it the authorized standard for valuing annuity charges and reversionary interests. But in life insurance practice it is now wholly antiquated, though its service in first introducing the common mind to the elements of the subject gives it great historical interest. Like its most famous successor, the Carlisle Table of Mr Milne, it rested upon observations of the population of a town. How far this limited and peculiar group represented the nation was still doubtful; no less so how far the rate of mortality among applicants for insurance, accepted by the offices, would correspond with that of the urban citizens or of the whole body.

Recent actuarial progress.

As soon as the companies had sufficient records of their own experience the work began of striving to construct, for business use, tables which should truly express it. This branch of research has ever since been prosecuted with all the resources they could command of industry, practical judgment, and mathematical skill; and the successive achievements in it may be accepted as in general the sum and measure of the progress of actuarial science. Thus during the last three generations the recognition of an ascertainable uniformity in human mortality has become part of the general stock of thought, and the accurate determination of the normal rate for all ages has been an accepted branch of scientific inquiry. The great mental and social changes in civilized men, which are implied in the general adoption of the practice of insurance, the growth of associated forethought and the decline of the gambling spirit, have no doubt made gradual and continuous progress in all the enlightened nations. But actuarial science, which originated in Great Britain, was long the peculiar and almost exclusive possession of British students, and even till now has been practised most fruitfully in its first home, mainly by the actuaries of life insurance institutions, but with important contributions from other inquirers, especially those in the service of the Registrar-General. The most complete storehouse of technical and practical learning on the general theory and on all its applications to life insurance practice is found in the successive volumes of the *Journal of the Institute of Actuaries.* The tables published by the Institute in 1872, founded on the experience to 1863 of twenty companies, and sufficiently described in *Ency. Brit.*, vol. xiii. p. 170, still remain the most authoritative expression of the mortality of insured lives, and have largely replaced all earlier standards in the valuations of the British companies, more than three-fourths of which, in their latest returns to the Board of Trade, compute their reinsurance reserves by the $H^{m.}$ and $H^{m.5}$ tables. But for several years a committee of the Institute and of the Scottish Faculty of Actuaries has been engaged in collecting and arranging for investigation the far vaster experience which has now accumulated in the hands of sixty companies, including the records of more than a million policies. The large basis of facts thus obtained will be treated with special reference to different classes of risks, and will throw much light on difficult questions of selection, which have hitherto been treated speculatively, or at least without the conclusive evidence of large averages, and are still more or less in controversy. Some of these will require more detailed notice hereafter.

It is only since the middle of the 19th century that actuarial science has rapidly advanced in other countries, chiefly under the stimulus of the extending practice of life insurance. Both in America and upon the continent of Europe the small business transacted by the pioneer companies was largely conducted on empirical and conjectural methods from year to year, English custom being consulted as a guide in fixing premiums. The Gotha Bank, the first institution to insure lives upon business principles in Germany, adopted at its foundation in 1827 a mortality table formed by Mr Babbage upon the basis of the Northampton Table, corrected from cursory notes upon the early experience of the Equitable Society, which had been given by its actuary to a general meeting of its members in 1800. The French companies, and several in Germany of later origin than the Gotha, took as their standard the so-called Table of de Parcieux, previously described; and this table, with modifications dictated by experience, was continued until very recently in general use in France. The Seventeen Companies' Table of 1843 was adopted by the Insurance Commissioners of Massachusetts, who in 1859 introduced the methods of state supervision of insurance now generally practised in the United States. This table, though long superseded in the esteem of actuaries in their ordinary work, is still the standard for official valuations in most states of the Union, a fact which has given it undue prominence. The so-called American Table, derived in 1868 from the limited experience of the largest American company during its earliest years, was the first important work of the kind done in America. In view of its narrow basis of facts, it has stood the test of time singularly well, and it is now in wider use than any other for computing the premiums of American companies. Its most marked difference from the standard British tables for insured lives is that it indicates a decidedly lower rate of mortality throughout the period of mature manhood, between the ages of thirty-five and seventy-five, though with a higher rate at the extremes of life; and this peculiarity is also found in American tables deduced from more recent and far larger experience.

Actuarial science has been widely cultivated in the *United States* of late years, the numbers and zeal of its professional students having kept pace with the extraordinary growth of life insurance. The aggressive activity of the companies through their agents and solicitors has brought the principles of the business home to the popular mind as in no other country, and a large number of periodicals are published devoted entirely to the subject of insurance, and striving constantly to make it intelligible and interesting to the general reader. These tendencies have been strengthened by the system of supervision practised by the states, which has also greatly influenced public opinion, directing attention in an extraordinary degree to certain special and technical features, to the neglect of more comprehensive and more useful criticism. In the official work of the state departments the actuary's province appears substantially to begin and end with the valuation of liabilities upon the net premium basis, which is applied with increasing strictness as the sole and final standard of solvency, and the determination by it of the "legal surplus" of each company. But a considerable number of professional actuaries have prosecuted their studies in a scientific spirit, and most of these since 1889 have been associated in the Actuarial Society of

America, which has established a high standard of professional competence in its examinations and transactions. The question how far the rate of mortality among insured lives in America is fairly represented by tables drawn from British experience has of course attracted much inquiry; and many companies have made important contributions to it from their own records, in several instances in the finished form of carefully graduated tables, each with an individual character, but all with some features which distinguish them as a group. By far the most comprehensive effort to establish a standard table for America is that of a committee of actuaries, for which, in 1881, L. W. Meech published the classified experience of thirty offices to the end of 1874, including most of the large companies in the United States, and embracing more than a million policies. The observations collected in this work have furnished materials for many important investigations, but the finished tables have rarely been applied in practice, being drawn from an aggregation of largely incongruous experiences, the influence of each of which upon the general average is indeterminate.

The business of life insurance upon the *continent of Europe* has extended rapidly since 1880, and has given an extraordinary stimulus to actuarial studies. Before 1883 the German companies computed their premiums and reserves by antiquated life tables, partly borrowed from early British usage and partly constructed by rough methods upon meagre observations. The most approved of these, as illustrating the duration of German life, was that prepared by Brune of Berlin in 1837 from the records for seventy years of an annuity society for widows, which practised careful medical selection of the husbands and kept exact mortality registers. In 1883 was published an admirable table founded on the combined experience of twenty-three German companies, which has superseded all other standards for ordinary valuations within the German Empire. The French companies generally continued to rely on the tables of de Parcieux, with modifications of their most glaring defects, until a still later date. In 1898 a committee of French actuaries published a new set of tables drawn from the experience of four of the principal offices in France, and these are now accepted as the best basis for life insurance practice by similar companies there. Schools of actuarial science have been opened in both Germany and France, and the professional actuaries of these countries, and of Austria and Belgium, have formed associations for the promotion of their pursuits. In 1895 delegates from the several institutes and societies of actuaries throughout the world met in general congress at Brussels, and again in 1898 in London, and in 1901 in Paris. Such sessions, which are held triennially, do much to broaden and harmonize the scope and aims of the profession.

Elaborate efforts have been made by several enlightened governments to employ the vast machinery of census bureaus for determining the general rate of mortality, and it has been the worthy ambition of able actuaries to devise trustworthy methods of utilizing the census returns for this purpose. The British Statistical Office, under Dr William Farr and his successors, and more recently the Swiss Federal Bureau of Statistics, have accomplished the best work in this direction, and the series of "English Life Tables," founded on successive decennial censuses, interpreted by the registered deaths during the intervals, are the most useful data now available for the average value of civilized life. But all such general tables are as yet but tentative and provisional. The imperfections of mortuary registries and of census returns are great, and result from a variety of causes, and corrections are largely conjectural. Until new and completer methods of collecting the facts are practised, the experience of life insurance companies promises to furnish the only mortality tables having claim to authority. Such a table, in the most trustworthy form now attained for it in each of the enlightened nations, is the result of immense intellectual labour for generations. A brief sketch of its evolution cannot suggest the amount of patient observation, of profound reflection, of ingenious mathematical research, which has gone to its production. As it approaches accuracy it becomes an epitome of human destiny, an essential element in momentous problems, historical and social. The work of correcting and improving it will go on with increasing zeal and insight. But the inquiry thus made does not aim, as some have imagined, at the formulation of a final law of mortality. The highest perfection attainable is but the expression of a temporary phase of human progress. It is already becoming evident that the general rate of mortality, and in particular the rate at each age of life, not only differs widely in different communities, but undergoes important changes in successive generations. A multitude of forces are at work in civilized society which must influence the average duration of life, such as the extension and concentration of many industries, the vast growth of cities, the progress of medical and hygienic science, the increase of wealth, comfort, and luxury, the changes in the frequency and destructiveness of war. It is plausibly maintained, on the one hand, that these and other causes have already added some years to the average lifetime of civilized man; and again, on the contrary, that their combined effect has been to lessen the sharpness of the struggle for existence, to rescue the weaklings from destruction and enable them to multiply, and so to weaken society at large. The final decision of the question will be found in the gradual modifications of the true table of mortality through successive epochs.

Rates of mortality.

For the purposes of life insurance the future of mortality tables looks to less ambitious problems. The business calls for exact equity in determining the value of all life contingencies, and therefore for the most precise forecast attainable of the dates at which the amounts assured must be paid. Some idea of the historical progress of this inquiry may be gathered from the accompanying table, which epitomizes the general characteristics of a number of typical tables of mortality, showing at ages which are multiples of five years the annual death-rate indicated by each of them. The comparison will be found interesting in many ways, most strikingly, perhaps, as suggesting what is confirmed by a detailed examination of the facts, that insured life on the average in Great Britain is decidedly inferior to that in the United States, but superior to that upon the continent of Europe, and especially in Germany. From a careful investigation of the published experience, Dr McClintock concludes: "It is an ascertained fact that after the first five years of insurance the probability of death," in Great Britain, "is fully one-fifth greater at any given age than the corresponding probability shown by American experience"; while "the average value of assured life in Germany is as much inferior to that shown in the H$^{m.}$ experience as that in America has been found to be superior."[1]

Table showing the number of persons who will die in a year out of 100,000 who have attained the given age, according to several tables of mortality :—

Age.	Northampton.	Carlisle.	Seventeen Offices.	Institute of Actuaries.	Institute of Actuaries.	American Experience.	Thirty American Offices.	Twenty-three German Offices.	Four French Offices.

No final explanation has been given, and there is no proof that the average life in America is longer than in England or Germany. But Dr McClintock inclines to

[1] *On the Effects of Selection*, by Emory McClintock (New York, 1892), p. 94.

believe that one potent cause of the great difference in the insured experience is that, while European offices have generally awaited applications, which are commonly prompted by some sense of need for insurance, the custom of American companies is actively to solicit business through agents. On the average, lives which are only induced by persuasion to insure are better than those which voluntarily apply. That this suggestion points out a real and perhaps an important differentiating influence upon groups of risks is not doubted, but the measure of its effects has not yet been determined. The question is one of many which yearly assume more prominence, and which, as a class, are conventionally termed problems of selection. Assuming that the general rate of mortality is precisely known, any deviation from it occurring in a special group of insured lives, as the result of some influence peculiar to that group, is called the effect of selection. If insurance were offered on equal terms to all, the feeble and dying would apply in disproportionate numbers, and the mortality would be excessive. To avoid this danger careful medical examinations are required, excluding risks which appear to be impaired; and this selection by the insurer uniformly reduces the mortality below the general average during the earliest years of insurance. During these years large numbers of the insured withdraw, either from inability or from indisposition to pay their premiums, but the motive to do so is weakest with lives which have become impaired. The average vitality is lowered by the loss on the whole of a superior class, and the average mortality of those who persist rises. The extent of this influence varies widely with the proportionate number of lapses and the motives which induce them, increasing in a startling degree when lapses multiply in a discredited company, and remaining small, or even at times doubtful, under very favourable conditions; so that the ascertainment of its amount in different circumstances, and for different groups of the insured, is a problem of extreme complication. Its importance is increased by two tendencies which have grown stronger in the practice of recent years: first, to permit at all times the withdrawal by any policy-holder of a substantial part of the technical or average reserve upon his assurance, a privilege which legislation and public opinion in the United States have extorted from the companies; and, secondly, the extensive introduction, under competition for public favour, of forms of policies which grant the option, at fixed dates in the future, between withdrawing the entire "accumulations," or technical reserve and surplus, and continuing the insurance. It is well known that at the maturity of these options the motive is strong for impaired lives to remain insured, and that the cash withdrawals are so largely of superior lives that the subsequent rate of mortality is much increased. Other problems in selection arise from varieties in the forms of policies. It is commonly recognized that there are general and marked differences between the mortality experienced upon assurances issued at low and those at high premium rates. Policies for short terms, on which the computed net rates are the lowest, have been found so unprofitable to the insurers that they are rarely granted, and only with a very heavy loading of the tabular value. Upon those insured for life, with annual premiums, there is a large and constant excess of death losses above the endowment assurances, while groups of policies with tontine or cumulative features or reserved bonuses, available only after surviving a term of years, uniformly experience a low mortality.

Problems of selection.

It is also to be remarked that, as the result of several investigations, it is found in general that the average amount of policies matured by death is higher than the average of all policies in force; and some actuaries incline to believe that tables of pecuniary loss might, for practical use, take the place of tables of mortality, since the actual claims are in units of money, not of lives. The vast field of inquiry opened to actuaries by these and many more special questions of selection promises to engross more and more of their attention and labour. The technical methods of reducing and treating the data of mortality have been brought to a high degree of perfection, but the necessity for a better classification of the data themselves, with reference to special groups of lives or policies, differentiated by social or local circumstances, by business methods, by forms of contract, by race or personal characteristics, must assume ever greater prominence. It is conceivable that, at some period hereafter, the practical reliance of the offices will be more upon tables to be computed for such special groups, from select experience, than upon those drawn from vast aggregates without discriminating among their somewhat incongruous divisions.

The mortality tables in common use, however, have been proved by a vast experience to furnish a safe and fairly equitable basis for the business of assuring lives. Assuming that the table shows how many of a large group now assured may be expected to end in each succeeding year, the present value of the claims upon them depends exclusively upon the rate of interest at which funds will accumulate. Exact foresight of this rate being impossible, the insurer must assume a rate which can with certainty be realized. The difficult problem of determining the limits of safety in this assumption attracts the more attention now, because of the recent persistent decline in the average productiveness of invested capital. The actuary is forced to observe that the interest factor in his calculations is much less definitely fixed by known facts than the mortality factor. The longer a contract has to run, the greater the effect of the difference in rate. The value of a payment to be made in thirty years is greater by above one-half with interest taken at 3 per cent. than at $4\frac{1}{2}$ per cent., and one to be made in thirty-six years is more than twice as great. Hence the most careful study of the forces determining for long periods the average rate of interest is fundamental in life insurance. But while the general theory of interest has been treated with masterly skill by some economists, it is but within a few years that the special problem of ascertaining what maximum rate can with entire safety be assumed, as obtainable for one or more generations hereafter, has excited wide discussion, and it has elicited singular diversity of judgment. The tendency of opinion is to hold that a progressive lowering of interest rates must result from the accumulation of wealth. In support of this belief it is pointed out that from 1872 nearly to the present time there has been a general and somewhat uniform decline in the yield of invested capital, as represented by government stocks, mortgage loans, savings bank deposits, and discounts in all commercial nations. The movement has been disguised by wide fluctuations, temporary or local, but has been on the whole world-wide and continuous, when great masses of capital, such as the investments of life companies, are kept in view. The fall has been greatest, too, in countries where rates were formerly highest, suggesting that as the great financial markets of the world become more intimately connected the normal rate of interest assumes a more cosmopolitan character, with an increasing tendency to equality among them. These considerations have had an important influence upon the computations of life insurance companies. In Great Britain, and commonly in continental Europe, the leading offices from the first assumed lower rates of interest than those in America, usually $3\frac{1}{2}$ or 3 per cent.; and the reductions in their

The interest factor.

estimates have as yet been moderate, only thirty-one out of seventy-four British offices having lowered the interest basis in their valuations reported to the Board of Trade. These returns show that of these companies only twenty-three now compute reserves upon a rate as high as $3\frac{1}{2}$ per cent., while forty-four assume 3 per cent., and seven a still lower rate. But in America, when the business first became important, 6 per cent. was a more frequent rate of investment than 5 per cent., and the laws of New York and of many other states countenanced the confident expectation of a permanent yield of at least $4\frac{1}{2}$ per cent. The rate of 4 per cent. adopted by the principal companies, and by the law of Massachusetts from 1861, was regarded as highly conservative. But as early as 1882 one important company began to reserve upon new business at 3 per cent., and since 1895 there has been a gradual change by the leading offices to $3\frac{1}{2}$ per cent., and in a few instances to 3 per cent., as the basis of premiums and of reserves upon new policies. Serious efforts have been made to induce legislation which will gradually establish one of these rates as a test of technical solvency.

There are not wanting, however, indications that the protracted decline in rates of interest in the world's markets may have been checked, and even that a reverse movement has begun. Rates of discount everywhere, interest on government loans except in America, and on mortgage loans in Europe, on the whole advanced during 1897–1900, the minimum average rates having been reached, after twenty-five years of gradual reduction, in 1897. These facts are entirely consistent with the conclusions suggested by the history of the subject. No uniform or secular tendency to reduction in the average rate of interest, which is the index of the average productiveness of capital, not of its amount, can be found to have prevailed. Fluctuations in the average rate are found, quite independent of the local and temporary fluctuations, which are often extreme; and these long tidal waves of change have at times, for generations together, risen and fallen with some approach to periodicity. The prevailing rate has been a little lower on the average in the 19th century than in the 18th, but was lower through the middle decades of the 18th century than through those of the 19th. On the whole, it seems clear that the accumulation of wealth in itself has no necessary tendency to diminish the productiveness of capital; that this productiveness, on the general average, has not materially varied in many generations; but that the promise and expectation of productiveness which prompt the demand for its use depend upon the activity of enterprise, growing out of the prevailing spirit of hope; upon the rapidity with which new inventions are made, industries extended, and floating or loanable capital expended in permanent works. These conditions are subject to fluctuations extending through considerable periods, so that for a number of years the rate may be higher, and then for a similar series of years lower than the normal rate, determined by average productiveness, but always tending to return to this normal rate, as the tide-swept surface of the ocean to its normal level. With this principle in view, it may be affirmed that, since the years 1895–99 were, on the whole, the period in which the average rates of interest were the lowest ever known throughout the commercial world, and since there were already unmistakable indications of an incipient advance, any rate the assumption of which for life assurance investments proved safe through these years may with much confidence be assumed for an indefinite future. Neither economic science nor history gives support to the belief, so often expressed, that a progressive decline in interest is the necessary result of increasing wealth, and must be accepted as a law of our industrial civilization. And while the excess of the average yield of capital in America, above that of the older nations, is diminished as the facilities of transfer and exchange increase, there is no reason to conclude that it will disappear for generations to come. It seems, therefore, that the general assumption of 3 per cent. for the valuation of British offices, and that of $3\frac{1}{2}$ per cent. which is becoming the accepted standard for the companies of the United States, should command unquestioned confidence.

Assets and reserve.

The present value of all the sums the future payment of which is promised by its policies, makes up the amount which the company must in some form possess, and must accumulate at interest, to meet these payments. If all insurance were purchased for cash (single-payment policies) this amount would be its necessary reserve. But the system of annual premiums, adopted for the convenience of the insured, is so nearly universal, that it has controlled the form in which the subject is conceived by actuaries as well as by the public. Let a mutual company be asked to insure one thousand healthy men, each aged thirty, for life for \$1000 each. It assumes that their lives will end substantially in accordance with an approved table of mortality, and that the price it receives for its contracts can be improved at compound interest until they mature. Making these assumptions conservative, it may perhaps value at this time the entire million of dollars to be paid in the future at \$331,407. But as a provision for the expense of management, and as a margin to protect it against all contingencies, such as excessive mortality or losses upon investments, it may add a charge of 30 per cent., with the understanding that whatever proves from time to time to be excessive in the price shall be equitably returned to the insured. Each policy then is sold for \$430·83. The insurance becomes the property of the insured, the price of it belongs to the company. But the actual transaction, under the customary system, is this: The insured, instead of paying the price in cash, grants the company an annuity due upon his life, making one payment for the first year. These annuities, if valued by the same assumptions of mortality and interest as the insurance, may be for \$21·76 each, the average present value of them being the price of the policy, or \$430·83. It is evident that while the company has sold its contracts for full value, it has invested 95 per cent. of the proceeds in the annuities, and has but 5 per cent. in hand for other purposes, less than one-fourth of the amount it has prudently assigned for expenses and as a margin upon its own assumptions. Each of the insured takes his policy subject to a lien or mortgage to secure an annuity worth 95 per cent. of its price; and of each annual payment subsequently made, the excess above his share of the expenses of the year, including losses by death, is applied to reduce this lien. In fact, if there were no expense and no deaths, it would still require fifteen annual payments by each of them, and compound interest for fifteen years upon these payments, to extinguish the debt. After thirty years, if we suppose all the contracts to have been kept, there may be 681 survivors of the 1000 insured; and their policies, upon the original assumptions, are now worth \$421,471·58, the amount which, with its interest, will pay them at maturity. The company must have this sum secured, together with a proper addition for expenses and a margin for safety. The annuities of \$21·76 upon each survivor are now together worth \$152,180·69. If this sum be still held to include a margin of 30 per cent. for all possible needs apart from expected death claims, the company must hold in other good investments than its future annual premiums at least \$304,409·52 as a guaranty for these contracts. Thus it is evident that the true assets of an active company must always consist in

large proportion of the future premiums secured to it by a lien upon its policies. But, in common language, its assets are understood to include only the funds held or invested by it in other forms; and its reserve is defined as that sum which, together with the appraised value of its future premiums, will suffice to pay its policies. This conception of the reserve would be strictly logical if the valuation of the premiums were exact. But no general method for this valuation has any claim to scientific precision. The net premium method generally adopted, and made obligatory by the laws of many of the United States,[1] has its important uses, as an aid to the management of the company, both in determining its condition and the tendencies of its progress towards strength or weakness, and in ascertaining the amount which can with entire safety be treated as surplus. The reserve thus computed is properly kept in view by actuaries, and its integrity is jealously guarded by all companies in good standing. When, however, a net valuation of liabilities by one fixed standard is imposed upon all companies by law, and the continuous possession of the technical reserve is made the condition of solvency, much injury is done in several ways. This reserve, being definite and easily calculable, has obtained undue prominence in the public mind and in legislation, as the one infallible test of a company's trustworthiness, to the exclusion of others, at least equally important, which are mainly matters of practical judgment. As a merely numerical test it is widely unequal in its application to companies with different scales of office premiums. In some instances, too, companies have been pronounced insolvent, and forced into costly and wasteful liquidation in the courts, to the irretrievable loss of their members, because of a technical deficiency of reserve, which would without doubt have been speedily recovered if they had been continued under wise management. The assumptions on which the net reserve is computed are all taken with wide margins upon the side of safety. It is assumed that future interest will be lower than the average now obtained; that the mortality will be that indicated by a table, which represents a probable maximum; and that the entire margin for all purposes provided in the loading on future premiums will be absorbed in expenses alone. These possible sources of surplus, taken together, give an immense recuperative power to the administration of a well-established company, and a rule which excludes them from consideration is not justified by business principles.

A prevailing fallacy in the popular mind, which has grown out of the practice of net valuations, is the inference that the average technical reserve represents the value of the individual policy. Each risk is properly assumed at its probable or average value at the time. But from that moment its circumstances are constantly changing in directions then unforeseen, and the expectation that such changes will occur is the motive for insuring. To treat them singly as unchanged in value at any later time is as illogical as it would be after some have matured. The actual value of any one risk borne by a company is indeterminate. It may become a claim to-morrow, or not for a generation to come. In the former case the company must now hold funds to pay in full; in the latter, the future premiums will perhaps more than suffice, so that no present reserve is needed. An entire reserve for the whole body of risks is essential, and its amount is definite, upon the reasonable assumption that the general average remains undisturbed by individual changes. A distinct reserve for a single policy is inconceivable. To recognize it is to deny the first principle of insurance. The average amount by which the reserve of a company must be increased, because of the existence of policies of a given class, is to the actuary an important fact, and is commonly accepted as his best guide in the distribution of surplus. But a popular theory has seized upon the assignment of this average sum to each policy, in the technical shorthand of the actuary, and holds that it is in each case the special property of the owner of that policy. The practical consequences are serious when, as often, many of the insured cease to pay premiums, and each demands the amount of the supposed individual reserve. His right to claim it is countenanced by a widespread public opinion, which has inspired statutes in Massachusetts and some other states, requiring companies to redeem all policies lapsing after the first two or three years of insurance at a price founded on the technical reserve. Yet, in by far the majority of instances, the lapse of policies is of itself a loss to the company. It is deprived of business secured at much expense before it has derived any of the advantage expected from the accession. It is compelled to pay numbers of its profitable contributors for ceasing to contribute. The burden falls in a mutual company upon the insured who fulfil their contracts. Such laws favour those who withdraw after few payments at the cost of those who maintain their insurance to the end, or for many years. But the American companies have largely yielded to the pressure of a mistaken public sentiment, and compete for favour by promising excessive values in case of surrender. Similar conditions exist in Switzerland, Austria, and other countries in which the business is minutely regulated by Government bureaus. But in Great Britain the companies are largely free from such influences, while an open market exists for policies which have a commercial value, with results on the whole more satisfactory to all parties interested than any rule of compulsory purchase which could be enforced on the companies.

Industrial insurance.

A special form of life insurance, which has had a wonderful development of late years, is the family insurance of the labouring people by the so-called industrial companies. Until recently this class of people had no satisfactory share in the benefits of insurance, although the friendly societies in Great Britain, and many forms of beneficial associations in the United States, were attempts, often in part successful, to provide for special wants, mainly for maintenance of the sick and for the costs of burial. Most of them, however, lacked a scientific basis and an efficient and permanent organization, while thousands of them were grossly mismanaged, and proved expensive burdens to their members. In Germany an elaborate scheme of compulsory insurance for labourers was established by a law of the empire in 1883, and extended in subsequent years; and similar legislation has been enacted in several other countries, most thoroughly in Switzerland and Austria. The ultimate value of this great social experiment cannot yet be determined. That it relieves much want and does a great service in preventing pauperism is not disputed; but that it also undermines the independent spirit of the people, and that it imposes a burden upon the national industry, which not only hampers it in the world's competition, but reacts with special injury upon the class it aims to benefit, are criticisms not satisfactorily answered. No scheme of Government insurance, certainly, is adapted to a people impatient of paternalism in its rulers and thoroughly habituated to voluntary association for all common interests. The solution of the great problem, how to apply the insurance principle to the most pressing needs for protection of the class supported by the wages of labour, is now sought in Great Britain and America mainly in the universal offer to them of industrial insurance. The Prudential Assurance Company of London was the pioneer in this work, beginning it experimentally in 1848, but

[1] It is fully explained in the earlier article in *Ency. Brit.* (9th ed.), vol. xiii. pp. 176, 177.

gradually adapting its methods to the new field, until a generation later they showed themselves so efficient that an extraordinary growth resulted, and has continued without interruption. This company and others upon a similar plan assure whole households together for burial expenses in case of death, and a small provision for dependents or for old age, charging as premiums small fractions of a day's wages, which must be collected weekly. The great difficulties encountered were the cost of small and frequent collections, and the high rate of mortality, which is from 40 to 90 per cent. more than that in the experience of the older companies. This high death-rate is due not so much to the fact that life is shorter in the labouring class, as to the lack of efficient medical selection, which would be too costly. The premiums, at best, must be made higher than in offices insuring for annual payments, but the demand for insurance extended as rapidly as the system could be explained, and the Prudential is said to have now in force 12,000,000 policies, with an average premium of twopence a week, secured by an accumulated insurance fund of £17,000,000. It has superseded a host of petty assessment societies of various classes without scientific basis or business responsibility, which deluded and disappointed the poor. The British Government in 1864 undertook to administer a plan for the insurance of working men, but in thirty years accomplished less than the work of one private company in a year. Eleven joint-stock companies and two mutual companies transact industrial business in the United Kingdom, besides a large number of friendly societies which have adopted similar plans. No complete statistics of their operations are available, but the claims paid by them in 1898 amounted to more than £3,900,000.

The system of industrial insurance was introduced into the United States in 1876. Its growth, though much more rapid than in Great Britain, was at first slow compared with that of recent years. The following table, condensed from the *Insurance Year-Book* for 1900, is an interesting exhibit of the character as well as of the extent of this form of insurance among working men :—

Industrial Insurance in the United States.

Year.	No. of Cos.	Insurance written.	Policies in force 31st December	Insurance in force 31st December.	Premiums received.	Losses paid.
1876	1	$400,000	2,500	$248,342	$14,495	$1,958
1880	3	34,212,131	228,357	19,590,780	1,155,360	430,631
1884	3	89,150,302	1,076,422	108,451,099	4,486,612	1,499,432
1888	7	161,260,335	2,788,000	302,033,066	11,939,540	4,162,745
1892	11	276,893,923	5,118,897	582,710,309	24,352,900	8,847,322
1896	11	360,852,458	7,375,688	886,484,869	40,058,701	13,420,336
1899	16	519,789,085	10,048,625	1,292,805,402	56,159,889	17,023,485

It is remarkable that the average weekly premium in the United States appears to be about 10 cents, or two and a half times as high as in Great Britain. The average policy is also proportionally larger, and the progressive increase in its amount deserves notice. At the rate at which the practice of insurance is now extending among working men, it would require but few years for it to become as universal in these countries as any paternal government has aimed to make it by compulsion.

Surplus distribution.

On the subject of surplus and its distribution little need be added. The very large sums officially reported as surplus by many American companies, and computed by net valuations of their contracts, are to be used with extreme caution as a means of comparing their merits. The character of their risks and their investments, the actual premiums and other terms of their contracts, are at least equally important elements of the question. But when these are satisfactory, and no reason appears for holding a large margin beyond the computed reserve, it is safe to treat the technical surplus as real, and in mutual companies to distribute it in some form among the insured. Besides the several bonus systems mentioned in *Ency. Brit.*, vol. xiii. p. 178, the so-called "contribution plan" deserves notice, since its theory is generally accepted by the American companies, though carried out with many variations in detail by different actuaries. The principle is, that since each of the insured is charged in his premium a safe margin above all probable outlays, when the necessary amount under each head becomes determinate the several excesses should be returned to him. It is therefore sought to calculate what each member would have been charged for net premium and loading had the mortality, rate of interest, and expenses been precisely known beforehand, and to credit him with the balance of his payments. As a corollary of the theory of net valuations, which regards every life insured as an average life until its end, and assumes the rigid accuracy and equity of all the formulas employed to represent business facts, it is consistent and complete. But many minds find it more curious than practical, and prefer to seek equity in faithfulness to contract rights rather than in adjustments which they deem too refined, if not fanciful. The plan has met with little favour in England, where surplus is more commonly distributed on general business principles. Enormous bonuses were saved by the British offices out of the excessive premiums at first collected, and by the American companies during the epoch of high interest rates. But the use of more accurate tables, the decline in interest, and the increased expenses of later years, have vastly reduced the apparent profits. Former methods of distributing surplus, when ascertained, have largely given way in America to novel and more complex plans. The Tontine idea, historically familiar, was for many years imitated by some offices in their assurance contracts. All premiums above outlay, in a company or a class of policies, were accumulated, only stipulated amounts being paid on death claims meanwhile maturing, with no compensation to its members withdrawing, until the end of a fixed term, when the whole fund was apportioned to the survivors. Large returns were sometimes made, but many who could not maintain their policies were dissatisfied. "Semi-tontines" followed, partly meeting the difficulty by pooling only the surplus, and allowing some return in case of withdrawal. But these cruder forms of contract are now largely superseded by various "reserve-dividend," "accumulation," "bond," and "investment" policies, with options at stated periods between cash withdrawals and continued assurance, the simple inducement to provide against death being more or less merged in that of making a profitable investment of capital. New and ingenious forms of contract are devised to meet the needs and fancies of all classes. This tendency is promoted by the growing wealth of the community, and is fostered by the companies, because small and frequent returns are far less impressive and less useful than the large accumulations of long periods. With the general increase of wealth and intelligence life assurance and investment become ever more closely associated.

A remarkable difference in the development of life insurance between Great Britain and the United States is, that among the British companies only one-third of the assurances in force is in purely mutual institutions, while in America the proportion exceeds four-fifths. In both countries there are also "mixed" companies, in which policy-holders receive a fixed percentage of the realized surplus, often from three-fourths to nine-tenths of the whole, but the control and management are in the hands of shareholders. These form the great majority of the proprietary offices in the United Kingdom, and the profits of the business have been large. The amount of capital paid in by shareholders of forty-one joint-stock companies was £5,931,000, but the capital authorized and subscribed was much more, and the subscriptions have often been paid, wholly or in part, by credits from surplus. The shares of these companies, at market prices, represent a value of at least £50,000,000, but the dividends upon these shares are drawn largely from other business, many of the largest and most

prosperous corporations conducting also fire insurance, and some of them marine or casualty insurance.

No branch of social statistics has been more diligently studied than this, and several governments publish classified accounts of corporations insuring lives within their jurisdiction. But the reports are not uniform in method and in periods covered, and aggregates derived from them must be used with reserve. A few tabular summaries of the general condition and growth of the business in the principal nations will illustrate the importance which the institution has attained, and its present tendencies and rate of development. By the Life Assurance Companies Act, 1870, and amendments made in later years, each company issuing policies in the United Kingdom must deposit with the Board of Trade every year its revenue account and balance-sheet for the preceding year, and must at fixed intervals cause an investigation of its financial condition to be made by an actuary, and furnish the public through the Board of Trade with the detailed results, in forms prescribed by the Act. Thus these returns are the highest authority for the conditions and operations of the offices, which often supplement or anticipate them by voluntary publications. In the United States the laws exact still more minute and much prompter reports to the insurance departments of the states; and every annual statement is required to show the results of an actuarial investigation, so that the fullest information concerning the business in any year and the condition of each of the companies is made public early in the following year. All these facts are diligently collected, classified, and compared by statisticians for several standard annuals in both countries, especially the *Post Magazine Almanack* and *Bourne's Directory* and *Manual* in London, and *The Insurance Year-Book* of the Spectator Company in New York. The first table contains a condensed summary of the accounts of the British companies for 1895–99, so arranged as to show in general the volume of the business, its rate of growth, and its financial results. The aggregates, however, are not precise for any date, since for some of the companies the fiscal year and the calendar year do not coincide.

The reports of the insurance department of New York cover more companies than those of any other state. The institutions not included in them are about thirty-five in number, mostly small and local. In the aggregate, as appears by their statements to the authorities of the states in which they organized, they held, 31st December 1899, in accumulated funds $24,470,240; their aggregate income for the year was $9,972,260; with assurances in force at the end of the year, $231,301,327. The New York reports, therefore, may be accepted as representing 95 per cent. of the entire business of the United States. On the other hand, while the amount of life assurance done by British and other foreign offices in the United States is insignificant, fourteen companies of the United States have agencies in Canada (ten for new business), and four transact business in Europe and in other parts of the world. The foreign operations of these companies brought in 1899 premium receipts of $34,609,291, and their assurances in force upon foreign lives was $826,537,158. Thus the home business of the American companies is in the aggregate about 87½ per cent. of the whole.

There are fifteen companies engaged in industrial insurance in the United States, whose aggregate assurances in force were as follows, on 31st December of each year:—

	1895.	1896.	1897.	1898.	1899.
	$	$	$	$	$
Industrial Assurances	819,521,573	886,484,869	995,545,736	1,109,526,870	1,292,805,402
Number of Policies	6,943,769	7,375,688	8,000,636	8,794,178	10,048,625

The statistics of life assurance in the Dominion of Canada are collected and published by the insurance department with the same diligence as in New York. A summary follows of the ordinary life insurance business transacted by the Canadian companies during the years 1895 to 1899. Sixteen of these are joint-stock companies, the one mutual company holding about 9½ per cent. of the assurances in force, and issuing about 8½ per cent. of the new assurances in 1899.

There are also fourteen British companies and fourteen of the United States which report Canadian business to the Government office, though five of the former and four of the latter group have ceased to issue new policies there. The financial operations and policy accounts of these companies are included in their statements to the British Board of Trade and to the New York State Department. The assurances in force upon Canadian lives in these companies were as follows:—

	Dec. 31, 1895.	Dec. 31, 1899.
14 British Companies	$34,451,168	$38,025,948
14 American ,,	93,402,067	104,460,607

None of the tables given above include the business done by assessment insurance associations, orders, and companies, most of which is of a local or ephemeral character. The volume of it in

[1] Including renewals, but exclusive of industrial policies.
[2] Exclusive of industrial assurances.
[3] Credit balance after payment of claims, &c.
[4] The largest company is included only in the last two columns.

the United States and Canada was very large a few years ago, but it is rapidly declining in amount and in public confidence, except where it is made an incident of membership in a benefit society. No general statistics relating to it are sufficiently comprehensive and accurate to be of value.

In the principal countries of continental Europe life assurance is offered by the chief international institutions of Great Britain and the United States, and their policies are in force probably to the aggregate amount of £140,000,000. The domestic companies have been stimulated to increased activity by the aggressive canvassing of the foreign agencies, and the business in recent years has grown rapidly, until now the total sum assured upon lives on the continent of Europe is little less than a milliard of pounds sterling. The preceding table collects in outline the accessible information concerning the life insurance companies of the countries named, as shown by their published reports at the close of 1898, all amounts being reduced to sterling money. Where the annuities paid are not specified, they are included in claims paid. The column of "Funds" gives the amount of accumulations held for life assurance in addition to the share capital, but in a few instances amounts held for other branches of business are included.

In Belgium there are four flourishing life companies, with accumulated funds of at least £1,500,000, and paying large dividends to shareholders. There are also six in the Balkan peninsula, three of them at Bucharest, most of which transact several kinds of insurance and are prosperous, though of only local importance. In Australia there are eleven domestic companies in the field, besides the Government Life Insurance Office of New Zealand. These Australasian offices together collected in 1899 premiums to the amount of £2,879,642; paid for death claims, £1,097,279; for endowments, £469,894; for annuities, £44,265; for surrenders, £517,714; and in cash bonuses, £69,458. They issued new assurances for £9,194,752, and held at the end of the year accumulated funds of £26,783,808. There are three small domestic corporations for life insurance in India, one in China, and two in Cape Colony, all conducted by Englishmen; but Brazil has five, the Argentine Republic one, Mexico two, and Japan thirty-three companies, organized and carried on by native managers. (C. T. L.)

V. Marine Insurance.

Marine insurance long antedates the kindred businesses of fire and life insurance. Villani, a 14th-century Florentine historian, speaks of marine insurance as having originated in Lombardy in 1182. This proves, at least, that in his day it was no novelty. It is mentioned in a Pisan ordinance of 1318, and in Venetian public documents of the early years of the 15th century. The earliest form of policy known is that given in the Florentine statute of 1523. It is uncertain whether insurance was introduced into England directly from Italy or by way of Flanders. The earliest policies issued in England which have yet been discovered are in Italian, but the subscriptions are in English (*Santa Maria di Venetia*, Cadiz to London, 1547, *Santa Maria de Porto Salvo*, Hampton to Messina, 1548).

History.

The earliest known policies in English are one of 1555 on the *Sancta Crux* "from any porte of the Isles of Indea of Calicut unto Lixborne," and one of 1557 on the *Ele* from Velis Maliga to Antwerp. In the *Sancta Crux* policy there is no detailed statement of perils insured against, or of risks undertaken by the underwriter; the whole obligation of the underwriter to the assured is embodied in the following words:—"We will that this assurans shall be so strong and good as the most ample writinge of assurans, which is used to be maid in the strete of London, or in the burse of Andwerp, or in any other forme that shulde have more force." This reference to Antwerp usage is 67 years before the date of Malyne's statement that all Antwerp policies contained a clause providing that they should in all things be the same as policies made in Lombard Street of London. The wording of the English policies written in Italian is very much simpler than the Florentine form of 1523, from which it almost seems that the wording used in England followed an earlier Italian form. But even the Italian policies in the two *Santa Marias* mention the uses and customs of "*questa strada Lombarda di Londra*" as the standard of the assurance they afford. The next most ancient policy we possess is dated 1613; it covers goods on the *Tiger* from London to "Zante, Petrasse, and Saphalonia." This document is much more ample than any of those already mentioned: it details the perils insured against in words closely resembling the Florentine formula of 1523, and differing only slightly from the form adopted by Lloyd's at a general meeting held in 1779, and afterwards incorporated in the Sea Insurance Stamp Act of 1795, which is the stem form of all modern British and American marine insurance policies.

While the form of the insurance policy was thus developing, there was a singular absence of legislation (and, as far as we can yet trace, of litigation) on the subject. Till 1601 differences seem to have been generally settled by arbitration. This accounts for the poverty of the British Admiralty records in matters of marine insurance. In 1601 a special tribunal was established by statute for summary trial of disputes arising on insurance policies; but, owing mainly to the opposition of the common-law judges, the new court languished, and by 1720 it had fallen into utter disuse. Park states that not more than sixty insurance cases were reported between 1603 and 1756. Consequently, when Lord Mansfield came to the Court of King's Bench in the latter year, he found a clear field. He practically created the insurance law of England. He made use of all the Continental ordinances and codes extant in his day, taking his legal principles largely from them; the customs of trade he learnt from mercantile special jurors. Subsequent legislation referred solely to the prohibiting of certain insurances (wager policies, &c.), the naming in the policy of parties interested therein, and the stamp duty levied on marine insurances. In 1894 Lord Herschell introduced his Marine Insurance Bill, which endeavoured "to reproduce as exactly as possible the existing law relating to marine insurance." This Bill has been examined and amended by various bodies of parties interested, and was referred to a committee. It was reprinted in 1899, but has not yet become law. In America a similar fate has attended the insurance code, forming part of the proposed civil code of New York, completed and published in 1865, of which a very slightly altered version was adopted in California and has been in effect there since 1st January 1873. On the Continent legislation at first took the form of local ordinances of commercial cities, such as Barcelona (1434–1484), Florence (1523), Burgos (1538), Bilbao (1560), Middelburg (1600), Rotterdam (1604–1655). In the third quarter of the 16th century Rouen produced a handy guide to marine insurance, *Le guidon de la mer*; and in 1656 Cleirac published there his *Us et coutumes de la mer*. This was followed in 1681 by the *Ordonnance de la marine*, which, through Lord Mansfield, had a great effect on English case law. In 1807 France produced the *Code de commerce*, on the model of which nearly every European nation has issued a similar code. Probably the best of these, and the most adequate as regards marine insurance, is that of the German Empire; but Hamburg and Bremen still preserve many of their local conditions by special contract in their policies. At the Buffalo conference of the International Law Society in 1899 an attempt was made to harmonize some discrepancies between the insurance contracts of different States, and the matter was referred to a committee, which reported to the conference of 1900 at Rouen, and of 1901 at Glasgow.

A contract of marine insurance is a contract of indemnity, whereby the insurer undertakes to indemnify the assured, in the manner and to the extent agreed, against marine losses, *i.e.*, the losses incident to marine adventure. There is a "maritime adventure," where any ship, goods, or other movables are exposed to maritime perils, such property being termed "insurable property"; also where the earning of any freight, hire, or other pecuniary profit or benefit, or the security for any loan or expenditure, is endangered by the exposure of insurable property to maritime perils; and where any liability to a third party may be incurred by the person interested in or responsible for insurable property by reason of its exposure to maritime perils. By "maritime perils" are meant the perils consequent on or incidental to the navigation of the sea, *i.e.*, perils of the seas, fire, war perils, pirates, rovers, thieves, captures, seizures and restraints, and detainments of princes and peoples, jettisons, barratry, and any other perils, whether of the like kind or not, which may be designated by the policy.

Definition.

The contract being one of indemnity against maritime perils, it is evident that no one can derive benefit from it who has not some

interest exposed to these perils. Hence the illegality of "wager" policies which are made "interest or no interest," or "policy proof of interest," or "without benefit of salvage," or subject to any other such term (19 Geo. II. c. 27). Wager policies are illegal only in the sense of being null and void to all intents and purposes. They cannot be sued upon, hence they are known as "honour" policies. They are of frequent use, generally for the protection of interests which, though real, are not easily defined, or are of pecuniary value hard to determine. But they are utterly ignored by the courts. The essential of insurable interest is the pecuniary advantage seen at the time of insurance as arising to the person in question from the safety or due arrival of the adventure, or the pecuniary disadvantage similarly arising from its loss or deterioration. But such interest may lapse before arrival or destruction of the venture, and with the interest lapses the right of the assured to recover from the underwriter. Should the assured simply transfer his interest to another, *e.g.*, by sale, he can assign his policy to the party who acquires his interest—unless, of course, the policy contains terms expressly prohibiting assignment. The customary form of assignment is endorsement of the policy either in blank or to a specified party. Within the limits already named, interests are insurable whether complete or partial, defeasible or contingent; similarly loans on bottomry or respondentia, advance freight not repayable in case of loss, charges of insurance, and shipmaster's, but not yet officers' or seamen's wages.

Value.

The owner of insurable property may insure its full value even though some third party have agreed or become liable to indemnify him in case of loss: a mortgagor has the same right of insuring to full value; while a mortgagee may insure only up to the sum due or to become due to him under the mortgage, unless the mortgagee is insuring for the benefit of the mortgagor as well as for himself, in which case, even though he insure in his own name only, he may insure up to the full value. A consignee may insure in his own name the total amount of his interest and that of others for whose benefit he insures. Where no special contract is made between assured and underwriter, the insurable value of certain matters of insurance is ascertained as follows. *Ship*—Her value at the commencement of the risk, including outfit, provisions, stores, advances of wages, and any other outlays needed to make the ship fit for the voyage or period of navigation covered, *plus* cost of insurance upon the whole. In the case of a steamship, the word "ship" includes machinery, boilers, coals, and engine stores. In the case of a vessel engaged in a regular trade, the word "ship" includes the permanent fittings necessary for that trade. *Freight* (whether paid in advance or not) —The gross amount of freight at the risk of the assured, *plus* cost of insurance. *Goods*—The prime cost, *plus* expenses of shipping and cost of insurance. *Other Interests*—The amount at the assured risk when the policy attaches, *plus* cost of insurance.

Policy.

A contract of marine insurance must be embodied in a document called a policy, which must specify the name of the assured (or of his agent in the effecting of the policy), the undertaking to insure, the objects insured, and the risk insured against, the voyage or time (or both) covered, the sum insured, the name of the assurers. The signature of the assurer is necessary; it is found at the end of the policy, and he is often on this account called the *underwriter*. The objects insured must be designated with reasonable certainty, regard being had to customary usage. The undertaking is usually expressed by saying that the assured or his agent "doth make assurance and cause himself to be insured." The risks are either the whole body of maritime perils detailed above, or any one or set of these, or any other named peril against which the assured desires protection. There is no restriction by law of the length of voyage that may be insured, but time policies are invalid if made for more than one year; a voyage and a period of time not exceeding a year may be covered on one policy. Policies are classed as *time* or *voyage* policies. It is not necessary to state in the policy the value of the objects insured, but generally the value is given; policies are therefore classed as *valued* or *unvalued*, the latter being often called *open* policies. The values of objects insured under open or unvalued policies are the insurable values given above. As it frequently happens that merchants desire to have all their shipments covered, by whatever vessel they may come, they require insurance in general terms; such a policy is termed a *floating* policy. It states the limits of voyage and value covered by the underwriter, and the class of ships to be employed. The particulars of each shipment are declared as the shipments occur, the declarations being usually endorsed on the policy. All shipments within the terms of the policy must be declared at their honest value, or in accordance with the special provisions of the policy, if any.

The consideration paid by the assured to the underwriter in return for the protection granted by the latter is called the *premium*. Until payment be made or tendered the policy is not ordinarily issuable, *i.e.*, unless otherwise agreed. When the assured effects insurance with an underwriter through a broker, then, unless otherwise agreed, the broker is liable for the premium to the underwriter, who is, however, directly responsible to the assured for losses or liabilities falling on the policy. But the broker has a lien on the policy for the premium and for his brokerage, and in case he has had dealings as a principal with the assured, he has a lien on the policy for any balance due to himself in insurance transactions, unless he should have known that in these transactions the assured was merely an agent. Some policy forms state definitely that the premium has been paid; when such a form is used and no fraud is proved, this receipt is binding between assured and underwriter, but not between broker and underwriter. If an insurance is effected at a premium "to be arranged," and no arrangement is made, then a reasonable premium is payable. The same holds where additional premiums have to be charged at a rate to be arranged and no arrangement is made.

It is evident that in nearly all the particulars of any adventure insured by an underwriter he is entirely dependent upon the assured for correct information. It is therefore the law that an insurance contract can be avoided and broken by either of the parties to it if the utmost good faith be not observed by the other. The obligation of perfect good faith is thus made reciprocal. Bad faith may show itself either in *concealment* or in *misrepresentation*. It is therefore made essential to the stability of any insurance contract that the assured must disclose before conclusion of the contract every material circumstance known by him, failing which the underwriter may avoid the contract. Every circumstance is deemed material which would influence the underwriter in his decision as to acceptance of the risk or the fixing of the rate of premium. Consequently the assured is not bound, unless specially asked by the underwriter, to disclose the favourable features of the risk offered, or matters known or presumably known by the underwriter (matters which are of common knowledge, and such as an underwriter ought in his usual business to be aware of), or matters respecting which the underwriter waives or declines information, or which the nature of the transaction renders superfluous. An agent effecting an insurance must, in addition, disclose everything material known to himself, or that he should know in the ordinary conduct of his business. Every representation of material fact made to an underwriter before conclusion of a contract by the assured or his agent must be true, or the underwriter may avoid the contract. Every representation is material which would influence the underwriter in his decision as to acceptance of the risk or to fixing of the rate of premium. A representation of fact is regarded as true if it be substantially correct; literal correctness is not essential. A representation of expectation or belief is true if it is made in good faith. The contract is deemed to be concluded when the underwriter accepts the risk.

Voyage insured.

It frequently happens in the course of business that before a vessel has completed the venture on which she is engaged arrangements have already been made for her future employment. Where a vessel is insured on time, this is of no moment as respects her insurance. It has likewise been decided that where any insurable object is covered by a voyage policy "from" or "at and from" a named place, the policy is not rendered invalid by her not being at that place when the insurance is concluded; but, on the other hand, there is an implied condition that she will begin the venture

within a reasonable time, and that if she fails in this the underwriter may avoid the contract. If the delay springs from circumstances known to the underwriter at the time of conclusion of the contract, or if the underwriter then acquiesces in it, the implied condition is nullified. If the assured abandons the venture insured, the contract expires; *e.g.*, if, before the risk commences, the vessel's destination is changed to one not covered by the policy. Where the policy specifies a place of departure, and the ship does not sail from that place, the risk does not attach. If, however, the vessel actually starts from her intended port of departure, and commences the venture, and thereafter it is decided to change her destination, this decision constitutes a change of voyage. In default of provision to the contrary, the underwriter may elect to avoid his assurance from the time of that decision, although the ship be still in the course she would have followed in her originally intended venture.

Should a ship depart from the proper course of the voyage she starts upon, and for which she is insured, such departure, when made without lawful excuse or justification, is termed *deviation*. From the moment it occurs, even though she subsequently return to her proper course without loss or injury, the underwriter may avoid his contract; but the intention to deviate is not effective. Deviation occurs (1) when in a policy a course is definitely specified and the vessel departs from it; (2) when, in absence of such definite specification in the policy, the vessel departs from the course usually and customarily followed in the voyage insured; (3) when, in absence both of definite specification in the policy and of customary course of navigation, the vessel, to the knowledge of the assured, departs from the course which would be followed by a prudent master acting in a seamanlike manner. If a policy provides for several named ports of discharge, the vessel may, without committing deviation, omit to proceed to one or more; but whether she goes to all or to some she must (in absence of usage or sufficient cause to the contrary) take them in the order in which they appear in the policy. If the policy provides for "ports of discharge" in a given district, then (in absence of usage or sufficient cause to the contrary) unless the vessel proceeds to them in their geographical order she makes a deviation. Similarly, in the case of a voyage policy, the want of reasonable despatch throughout, unless lawful excuse or justification exists, entitles the underwriter to avoid the contract from the time that the delay becomes unreasonable. As excuses for deviation or delay on the voyage contemplated by the policy, the following are regarded as valid: authorization by license or other provision in the policy, *force majeure*, compliance with express or implied conditions of the policy (*e.g.*, warranties, see below), reasonable steps taken for the safety of the ship or other objects insured, saving life, or helping a ship in such distress that life may be in danger. If barratry is insured against, delay arising from barratrous conduct of master or crew does not avoid the policy. A deviation ceases to be excusable unless the ship resumes her proper course and proceeds on her voyage with reasonable promptitude after the cause of the reasonable delay ceases to be effective.

Warranties.

In every contract of insurance there are certain conditions precedent to the liability of the underwriter and incumbent on the assured, which must be fully and literally complied with, whether material to the risk or not. These conditions are known in insurance as *warranties*. The name is unfortunate, as in every other branch of the law of contract it bears another meaning; still it is convenient, and its insurance signification is now firmly established. Failure on the part of the assured to fulfil a warranty *literally* entitles the underwriter to avoid his contract as from the moment of breach,[1] but it does not limit his obligation up to that moment. Breach of warranty is not nullified by subsequent remedy of the breach, consequently loss occurring after breach of warranty is not at the charge of the underwriter, even although before the loss the assured has again complied with the warranty. Breach of warranty is excused in two cases only: (*a*) when by change of circumstances the warranty ceases to be applicable to the contract, (*b*) when by subsequent legislation the warranty becomes unlawful.

Warranties are of two classes: (1) express, (2) implied. Express warranties must be written or printed on the policy, or contained in some document explicitly referred to in the policy, and so regarded as incorporated in the contract. No special form of words is essential to the validity of a warranty if the intention to warrant can be inferred. Express warranties may refer to anything which the parties to the contract choose, *e.g.*, the nationality of the vessel, her sailing on a named day, proceeding under convoy, being excluded from certain voyages or trades or the carriage of certain cargoes, being "well" or "in good safety" on a named day (in which case the warranty is fulfilled if she be safe at any time of that day). As regards *nationality*, if no express warranty be given there is no undertaking on the part of the assured that the vessel is of any particular nationality, or that she will not change it while the risk lasts. The warranty of *neutrality* in case of a ship's insurance means that at the commencement of the risk the vessel concerned is actually neutral, and that as far as the assured can control the matter she shall so continue during the whole course of the risk. It is also an implied condition of the ship being warranted neutral that to the utmost of the assured's power she must carry the papers necessary to establish her neutrality, must not falsify or suppress these papers, or use simulated papers; if this condition is broken the assurer can avoid the contract. Where goods are insured and warranted neutral, they must be owned by neutrals during the whole course of the risk, be properly documented, be shipped to a neutral destination on a neutral vessel, which must, so far as she is within the assured's control, remain neutral throughout the venture. The words of an express warranty are always to be taken in their commercial sense; within that sense they are to be strictly and literally taken.

In addition to these expressed conditions, there are also certain essential factors or conditions inherent in each and every contract of marine insurance without exception; these are *implied* warranties, which are presumed from the very fact of the making of the insurance. They are (*a*) completion of the prescribed venture without *deviation*, (*b*) *legality* of the venture (viz., that the adventure insured is a lawful one, and that, so far as the assured can control it, it shall be carried out in a lawful manner), (*c*) *seaworthiness* of the ship. In a voyage policy it is an implied warranty that at the commencement of the voyage the ship shall be seaworthy for the particular venture insured. If the risk commences when the ship is in port, then she must in addition be reasonably fit to stand the ordinary dangers of the port. If the voyage insured is one in which different degrees of peril are to be encountered, or for which the ship needs different kinds of outfit at different stages, then she must be seaworthy for each stage at its commencement, and the warranty will be fulfilled if she is at the beginning of each stage seaworthy for that stage. The warranty of seaworthiness is held to be fulfilled when the ship is reasonably fit in every respect to meet the ordinary marine dangers of the venture insured; that is to say, the mere loss of a vessel by perils of the sea is not a proof of unseaworthiness in the sense of this warranty. The only ship policies not subject to the warranty of seaworthiness are policies on time (the reason given being that there is nothing to prevent a time policy lapsing and a new one commencing when the vessel is at sea beyond her owner's control as to seaworthiness); but where the assured knowingly sends a ship to sea in an unfit state, and the loss is produced by that unseaworthiness, the underwriter is not liable for such loss. It is not implied in a policy on goods or movables that these goods, &c., are seaworthy.

Interpretation.

When the main points of the preceding particulars of the contract of insurance are summarized it may be said that the transaction is (1) a contract of indemnity reduced to written or printed words, (2) made in good faith, (3) referring to a defined proposition or amount, (4) of a genuine interest in a named object, (5) being against contingencies definitely expressed, to which that object is actually exposed, and (6) in return for a fixed and determined consideration. The presentation of the contract in words may fail to convey the complete common intention of the parties making it, and it is therefore necessary to state in what way the written document is properly to be interpreted. Duer (*M. I.* i. 158, 159) states that with the exception of con-

[1] Lord Mansfield expressed it: "The warranty in a contract of insurance is a condition or a contingency, and unless that be performed there is no contract" (*Hibbert* v. *Pigou*, *apud* Marshall, 3rd ed., p. 375).

ditions in a policy which are construed as warranties, and must be literally fulfilled,

the actual intention of the parties is the controlling principle from which all the special rules of interpretation flow, and to which they are all subsidiary and subordinate. These rules have no positive and arbitrary force.

But as the policy is a written instrument, account must be taken of its wording. The terms used in the policy

are assumed to be understood in their plain, ordinary, and popular sense, unless they have generally in respect to the subject matter, as by the known usage of trade and the like, acquired a peculiar sense distinct from the popular sense of the same words, or unless the context evidently points out that they must, in the particular instance and in order to effectuate the immediate intention of the parties, be understood in some special and peculiar sense (Ellenborough, *Robertson* v. *French*, 1803).

In briefer form, the words of the policy are to have their proper value and effect given to each of them, and to be understood in their plain sense, except in so far as they are affected by (*a*) custom or (*b*) context.

(*a*) As regards *custom*, the policy is interpreted in accordance with the usages of the particular trade in which the adventure insured is engaged or employed. In fact, a valid usage is a part of the contract.

Lord Mansfield said, "Usage is always considered in policies of insurance even when the words are plain" (*Preston* v. *Greenwood*, 1785); and Buller, J., stated that "Usage not only explains but controls the policy" (*Long* v. *Allen*, 1785). Duer (*M. I.* i. 245) develops this dictum as follows: "Where the words to be interpreted are indeterminate or ambiguous, the usage *explains* them; but when they convey a definite meaning that the court would be bound to adopt, or their construction has been settled by law, the usage *controls* them: and in these cases it does *set aside* what, judging alone from the terms of the policy or the rule of law, was the plain intention of the parties; but, in controlling, the usage does not contradict the words—it merely varies by extending or enlarging their application."

(*b*) The contract being one contract, the various parts of it are reasonably to be expected to tend to one end; therefore the document must receive the effect of its general scope and intent. Consequently, should there be two possible readings of an ambiguous clause, the one of which would add nothing to the contract as expressed elsewhere, while the other adds to the effect of it, the latter interpretation is to be adopted. It cannot have been added without the intention of extending the contract. But this principle operates within the limits prescribed by the nature of the insurance itself; so the words insuring against "all other perils, losses, and misfortunes" are restricted to apply only to occurrences of the same class (*ejusdem generis*) as those perils enumerated in the policy. Similarly, as the policy has been for the last 150 years generally a printed document, clauses specially added have attached to them more weight than the ordinary text of the policy. These may be printed clauses in the margin of the policy, or printed clauses impressed on or attached to the policy, or clauses written on the policy. At each stage we come nearer to the circumstances of the particular risk and the special contract of assured and underwriter. Duer (*M. I.* i. 166) puts it, the printed words "may not express the intentions of the parties," while the written words "certainly do": it might be safer to say "are certainly expected to do so." The policy being a contract of indemnity to the assured, its provisions in his favour are to be taken cumulatively, and not as restricting or excluding one another, the underwriter being taken to intend that he shall understand the indemnity given to be as extensive as its terms will upon any fair consideration import. Similarly, as the policy is the language of the underwriter, any ambiguity in it must be taken most strongly against him.

It has become a settled rule of marine insurance that "the underwriter is liable for no loss which is not proximately caused by the perils insured against." The decisions of the courts lead to the conclusion that what has to be done is to determine the immediate, the very last cause of the loss or damage; if this very last cause is one of the perils insured against, or is *ejusdem generis*, then the loss or damage is at the charge of the underwriter, unless there is among the more remote causes personal fault of the assured, simple tear and wear, ordinary leakage and breakage, unseaworthiness of the vessel, or the inherent nature of the article insured (*vice propre*). Where a policy insures against only certain named perils to the exclusion of others, it becomes of primary importance as regards the incidence of liability to determine whether the *causa proxima* (the immediate cause) of any particular disaster is of the perils enumerated in the policy or not. Some of the most difficult questions of marine insurance have arisen in this connexion.

Causa proxima.

The earliest English policies named neither the perils which they were meant to cover, nor the kinds of losses for which the underwriters were liable, nor the pecuniary limit to which that liability extended. Later policies designated the perils, but none of them contains full details either of the kind of losses covered by them or of the extent of the underwriter's liability. In the "sue and labour" clause (which appears to be indigenous to England, and has not yet been traced farther back than the policy of 1613 on the *Tiger*) particulars are given of the special kind of liability imposed by it on the underwriters, and the principle of *pro ratâ* liability of the several underwriters is stated. But this is only a subsidiary side-contract dealing with particular charges. The "waiver" clause, which grew out of the "sue and labour" clause mentions "abandonment" as somehow connected with the perils insured against; but this clause is not found as early as 1613. Lastly, in the *Memorandum*, which was first introduced into policies about the year 1749, there are found the words "average, unless general." It is therefore only in an indirect way that we can arrive at a knowledge of the "losses and misfortunes" that are at the charge of the underwriter. One occasion of liability must from the first have presented itself as indubitable, namely, actual total loss arising from any of the perils insured against. Very nearly allied to it is total loss by disappearance, manifested by want of news within reasonable time respecting the venture, *i.e.*, the case of a "missing ship." Next comes the case of an insured object being so damaged by perils insured against, that although not actually and absolutely lost, it is to all reasonable and commercial intents and purposes as bad as lost: this is what is known as "constructive total loss." But marine perils may produce loss not necessarily total, *i.e.*, partial loss: it may only amount to "damage," which may be either a diminution in quantity (total loss of part) or a deterioration in quality of the objects insured. The liability attaching to a marine policy for such losses less than total is termed "average." When the loss is in the end borne by the various parties to the venture, the average is called "common" or "general average"; when it is throughout entirely borne by the party interested in that object, it is known as "particular average." Again, as is explained above, there are side-agreements embodied in the same document as the ordinary insurance contract, dealing with "sue and labour" expenses or "particular charges," and (in most modern steamer and sailer policies) there is the clause in which the underwriter assumes liability for a stated proportion of the vessel's liabilities for damage done by "running down" another vessel in collision. The law on these various losses is as follows.

Effect of policy.

A total loss may be (1) actual, or (2) constructive; and

an insurance against total loss covers the assured against both, unless a different intention appears from the terms of the policy. It is an actual total loss when the object insured is completely destroyed, or is damaged beyond repair—so as to cease to be of the denomination of goods to which it belonged when insured, or so as to be incapable of reaching destination in specie—or when the assured is irretrievably deprived of the property insured. Under this may be regarded the case of a missing venture, *i.e.*, where after a reasonable lapse of time no news has been received of the ship concerned, in which case an actual total loss may be presumed. When a ship is so damaged by perils insured against that the costs of repairing the damage would exceed the value of the ship after repairs, there is a constructive total loss. Among the costs of repair are reckoned the expense of future salvage operations and future contributions to general average which the ship would have to make. (It appears to be doubtful whether the damaged value of the ship should come into calculation at all: if so, then it should be deducted from the repaired value of the ship: *v. The Gallia*, before Phillimore, J., Liverpool, 5th December 1899). If the assured is deprived of possession of his ship by an assured peril, and it is doubtful whether her recovery is possible, or can be effected at a cost less than her value when recovered, there is a case of constructive total loss of ship. In the case of all interests other than ship, where the damage or deprivation by insured perils is so severe that it is not, in view of the cost, commercially reasonable to insist on the completion of the venture, there is a constructive total loss. In determining what is commercially reasonable, regard is to be had to the course which would be adopted in the same circumstances by a prudent person uninsured.

Total loss.

When the assured has proved his loss to be constructively total, he must decide within reasonable time whether he will treat the loss as partial (and receive his indemnity as described below under partial loss), or as an actual total loss, and abandon the object insured to the underwriter. If he elects the latter he must give notice of abandonment, failing which the loss will be treated as merely partial. Notice of abandonment must clearly indicate the intention of the assured to abandon the goods without reserve or condition to the underwriter: it may be spoken or written, or partly spoken and partly written. Notice should be given as soon as the assured has such definite intelligence as will enable him to make up his mind that the venture is in effect totally lost. Once notice is given it is irrevocable unless the underwriter consents to the withdrawal. Similarly notice may be waived by the underwriter. The refusal of the underwriter to accept abandonment does not prejudice the rights of the assured. If the underwriter returns no reply to the tender of abandonment he is held to have declined acceptance. But he may accept either by express statement or by implication. Acceptance once stated or implied is irrevocable, being regarded as conclusive admission of the loss and of liability for it. Notice is unnecessary when there can be no possible benefit from it to the underwriter at the time news of the loss reaches the assured. When abandonment is declined, the validity of the abandonment is determined from the state of the case at the time of action brought. In consequence it has become not unusual for the assured to add to tenders of abandonment words in which they request, in case abandonment is declined, to be put in the same position as if writs had been issued and thus action brought. Valid abandonment effects an immediate transfer to the underwriter of all interest in what remains of the property insured, and he becomes possessed of all rights and remedies of the assured connected therewith as from the time of the casualty causing the loss. He equally stands at the risk of all reasonable acts or things done in good faith by the assured or his agents after the date of the casualty causing the loss. In the case of abandonment of a ship in course of a voyage the underwriter becomes entitled to the freight she is in the process of earning, and does earn after the casualty leading to the abandonment, but he is not entitled to the transfer of any other freight contracts. Should the vessel at time of abandonment be carrying goods belonging to her owner, the underwriter is after valid abandonment entitled to reasonable freight for any carriage of them which the ship may perform after the accident causing the abandonment. When the assured fails in an action for total loss, actual or constructive, he is not precluded from recovering a partial loss if the policy insures him against partial loss. When in consequence of the occurrence of a total loss, actual or constructive, the assured has a valid claim against his underwriter on a valued policy, the assured receives from the underwriter the amount which the latter has insured, and surrenders to him what remains of the subject matter of the insurance. If the policy be unvalued the assured cannot recover beyond the insurable value of the property insured, and each underwriter is liable for his *pro ratâ* share up to the amount of his subscription.

Losses other than total would naturally be called partial losses, but there is some variation in the use of this expression. By many it is used as designating solely diminution in quantity or deterioration in quality of objects insured, that is, as equivalent to particular average as explained above. Some would also include under it general average; others would add salvage charges, particular (or special) charges, and sue and labour expenses. General average is really an outlying branch of the law of affreightment; it is a reciprocal liability of shipowner and cargo owner to one another, and comes into insurance only in so far as the underwriter has assumed the liability of either of these parties. An act whereby any extraordinary sacrifice or expense is voluntarily and reasonably made or incurred at a moment of danger, and to preserve the whole common venture, is called a general average act; the loss directly arising from it is called a general average loss. In case of such a loss the various parties to the adventure are by the universal law maritime liable for a rateable contribution to the same, called general average contribution. The amount of contribution from the owner of any particular goods is, subject to the terms of the policy, recoverable from the underwriter to the full extent, if the amount insured on these goods equals or exceeds their contributing value, but *pro ratâ* if it is less. If the general average act is a peril insured against in the policy, as jettison usually is, then the assured can claim his whole loss by the act directly from his underwriter, who enters into his rights of recovery in general average. But the underwriter is not liable for general average loss or contribution not incurred in connexion with perils against which he insures. The costs of services in the nature of salvage rendered by the assured or his agents or employees to avert from the whole venture some peril insured against, are apportioned as general average rateably over all the interests benefited. The shipowner is bound to take the necessary steps for procuring an adjustment of any general average loss connected with his vessel and for securing its payment. Should ship, freight, and cargo all belong to one person, he may recover from the underwriters of each separate interest their share as if they had insured them for different persons. Particular average may now be defined as a loss which is not general average loss; it falls exclusively

General average.

on the owner or other person interested in the goods, and gives no claim for contribution from other persons concerned in the common marine venture. The consideration of particular average is much complicated by the fact that in modern insurance practice hardly any object is insured without some special condition in the policy, usually expressed in the form of a warranty, that the insurance is either to be free from claim for particular average altogether, or free unless the damage attain a certain percentage of the value of the object. What follows must therefore be taken subject to any such special provision expressed in the policy. When a damaged ship has been repaired the owner insured is entitled to recover the reasonable cost of these repairs, less certain customary deductions based on tradition and long-standing practice (such as the deduction of one-third from the cost of new materials used in repairs, called thirds "new for old"), but he cannot recover in respect of any one accident more than the sum insured. The same cost of repairing the whole damage similarly reduced by deductions is the limit of the underwriter's liability in case the vessel is not repaired at all, or if she is only partly repaired. If the vessel is not repaired, but sold during the course of the risk, the assured is entitled to the reasonable cost of the repairs less the proper deductions; but in this case the limit of indemnity is the actual depreciation as ascertained by the sale. In case of partial loss of freight the assured recovers such proportion of the insured value (in a valued policy) or insurable value (in an unvalued policy) that the amount of freight lost bears to the whole freight at the assured's risk. While particular average on ship is usually determined by the cost of repairs, particular average on goods is usually determined by survey and appraisement of the percentage of damage, or by sale of the goods and by comparison of the sound and the damaged arrived values. The percentage of loss is applied to the insured value if the policy be valued, and to the insurable value if unvalued, and the amount thus arrived at is the liability of the underwriter. The sound and damaged values employed are the gross sound and damaged values of the goods at the time and place of arrival when freight duty and landing charges have been paid; except in the case of certain articles subject to severe customs duties, and therefore usually sold by importers in bond (such as tobacco, tea, coffee, wines, spirits), in which case the price in bond is taken as the gross value. The expenses of sale falling on the buyers are added to the gross proceeds; and if a claim is established against the underwriter, they are recoverable from him as "extra charges." If various classes of goods are insured in a valued policy without specification of the separate items, the insured value of each class is ascertained by taking the same proportion of the policy valuation that the insurable value of each class bears to the insurable value of the whole; and the claim on the underwriter is made up as above.

Particular average.

When the policy contains such warranties respecting particular average as have been indicated above, then the loss of any separate parcel or parcels is not recoverable unless there is an agreement to that effect in the policy, or the parcels are separately valued therein, or there is a commercial custom to treat them as if separately valued. When a particular average warranty specifies a certain percentage below which no liability attaches to the underwriter, this percentage is called the franchise. As a rule, the more delicate the goods the higher the franchise. It is not permissible to add general average contribution or loss to particular average loss to make up the franchise. On voyage policies separate losses occurring on the voyage can be added to make up the percentage: on time policies the losses of each separate voyage have to be treated separately as regards franchise, and the underwriter is liable for them although the sum of them may exceed the amount insured. But if a total loss occurs to an insured object which has sustained damage for which no recovery has been made from the underwriter, then the underwriter is not liable except for the total loss. In order to prevent the failure to attain the franchise becoming onerous to the assured, and thereby as it were depriving him of the protection of insurance, the plan was adopted of breaking up a shipment into subdivisions, each of which is treated for purposes of franchise as a separate interest; these subdivisions are called series. The size of the series depends on the value of the goods; it is usually taken as about one hundred pounds' worth of the article insured, *e.g.*, 10 bales of cotton, each package of indigo, 10 chests of tea, 20 baskets of Java sugar, 50 bags of pepper. But as this arrangement was introduced for the benefit of the assured, the specification of franchise in the policy does not override his right to claim his indemnity on the whole if that is more to his advantage.

Certain charges and expenses are treated similarly to particular average: (1) Sue and labour expenses incurred solely with a view to the preservation or benefit of the particular object insured; (2) the charges recoverable by a salvor under maritime law, which may be called charges for independent or speculative salvage, to distinguish them from the salvage services of agents hired to effect a benefit to the whole venture, which are apportioned as general average; (3) particular or special charges, such as cost of reconditioning cargo at an intermediate point on the voyage, warehouse rent there, cost of reshipping, and cost of forwarding. But special charges are not particular average, so they are not excluded by a particular average warranty, and they do not need to attain any named percentage to be recoverable.

This method of determining an underwriter's liability for damage applies only to cases in which the cargo reaches its destination. When it does not arrive, but remains at an intermediate point, and either cannot be forwarded at all or cannot be forwarded except at a loss, it becomes a constructive total loss; and when the underwriter accepts abandonment or pays the loss the proceeds become his. The practice in such cases is for the captain or ship's agent at the intermediate point to sell the cargo, and forward the proceeds to the consignee through the ship's agents or owners at destination; whereupon the assured claims from the underwriter the difference between the amount insured and the proceeds realized. This form of settlement is termed a loss with salvage or a salvage loss. When an underwriter pays for a loss, total or partial, he thereupon becomes possessed of all the rights and remedies of the assured in so far as the assured has been indemnified by the payment of the loss: in case of payment for a total loss, whatever remains of the object insured becomes vested in the underwriter.

It may happen by accident or by design that an insurable object has been covered twice or more times, and that in consequence the sum of the insurance effected exceeds the value in the policy or the insurable value, if an unvalued policy has been employed. This occurrence involves a new set of relations between the assured and his various underwriters; the underwriters themselves are brought into relation to one another. As regards the assured, he may, in the absence of agreement to the contrary, claim payment from whomsoever of the underwriters he may select, but he is not entitled to receive in all more than his proper indemnity. Each underwriter is entitled to receive credit for his proper proportion of the sum received by the assured under any other policy. If the assured does obtain any sum in excess of indemnity, he is regarded as holding it in trust for his whole body of underwriters. In such case each underwriter is bound, as between himself and the other underwriters, to contribute to the loss rateably in proportion to the amount of his liability under the policy; and if any one pays more than his proper share, he is entitled to sue the rest for contribution. Should the assured get any of his premium back? It would not be equitable to enforce a return from any underwriter who has at any time stood alone so as to be liable to the full extent of his policy; but if overlapping policies were accidentally effected all at the same time, the case is rather different. This leads to the general question of return of premium. Such return may be claimed under the terms of the policy, in which case the claim for return is simply the carrying out of the agreement between the parties; it may refer to the whole or to a part of the interest insured. But there are other circumstances in which returns can legally be claimed. For instance, it may turn out that interest insured by a particular vessel and for a particular voyage is never shipped in that vessel for that

Multiple insurance.

voyage; the underwriter has in this case run no risk, and therefore the consideration for which he received the premium totally fails, and the premium is properly returnable to the intending assured, unless there has been fraud or illegality on the part of the assured. Similarly in the case of part of the interest insured on a policy, if that part is distinguishable in the policy or by custom of trade. But the interest might have made the voyage in the vessel, and the intending assured might yet remain without insurable interest. In this case, in absence of fraud or illegality, and if the policy is not merely a gaming or wagering contract, the assured is entitled to return of his premium. Similarly if the underwriter legally voids his policy from the beginning of the risk; as he runs no risk, he receives no premium. The only cases, except those of fraud and illegality, in which the underwriter can retain his premium without running risk, are those of risks underwritten *lost or not lost*, and arrived safely, in which the underwriter takes his chance as to the condition and situation of the ship when he assumes the risk. But this is practically a case of agreement that there shall be no return.

Liabilities.

Recent extensions of marine insurance in England have mostly been in the direction of giving to shipowners protection against liabilities to third parties. The first addition was the running down clause (*r.d.c.*) by which underwriters take burden of a proportion, usually three-quarters, of the damage inflicted on other vessels by collision for which the insured vessel is held to blame. The rapid increase in the use and size of steamships was accompanied by an equally rapid increase in the frequency of collisions at sea, tending to make the shipowner's liability increasingly serious, and to make the shipowner desirous of insuring himself against the balance of his collision liability, and against whatever other liabilities to third parties might be imposed upon him. There was a hesitation on the part of underwriters to meet these wants, and the result is that in Great Britain most liability insurances are effected in mutual insurance societies. The insurance of such liabilities is perhaps simpler in Great Britain than in other countries, as the amount for which a shipowner can be liable is limited by law, although, of course, none but English tribunals are bound by that law. The general rule of English law regarding the indemnity to be paid by an underwriter on liabilities is that its amount is (subject to the amount insured and the provisions of the policy) the sum payable by the assured to the injured third party. Another interesting class of insurances has received much attention, namely, those against the risks of capture, seizure, and detention by a hostile Power, generally described briefly as war risks. But the difficulties connected with such risks probably lie more in determining the legal position of the owners of the property and the obligations under which they lie, than in settling those of their underwriters. Such questions concern *blockade*, *contraband*, *domicile*, *nationality*, *neutrality*, &c.

Conflict of laws.

An attempt was made at the Buffalo conference of the International Law Association in 1899 to prepare a body of rules dealing with those parts of marine insurance on which the laws of maritime countries differ. This undertaking is of the same nature as the earlier efforts of the same association which resulted in the formulation of the York-Antwerp rules of general average. There are four important subjects on which great divergence prevails: (*a*) Constructive total loss; (*b*) Deductions from cost of repairs, new from old; (*c*) Effect of unseaworthiness and negligence; (*d*) Double insurance.

(*a*) Constructive total loss results, according to the law of France, Italy, Spain, Belgium, Holland, in case of loss or deterioration of the things insured amounting to not less than three-quarters; in German law a ship is considered to be "unworthy of repair" when the cost of the repair, without deductions new for old, would amount to over three-fourths of the ship's former value (no similar provision seems to exist in Germany for goods); in the law of America a damage over 50 per cent. of the value of the vessel when repaired is a constructive total loss of the vessel, in case of the policy containing no express provision to the contrary. None of these varying systems appears to be so equitable to all concerned as the British rule, which was for this reason suggested to the Buffalo conference for international adoption. As regards the time when the test for constructive total loss should be applied, it was suggested to reject the British rule, prescribing that it shall be the time of commencing action against underwriters, and to adopt the Continental and American rule referring to the facts as they existed at the time of abandonment. Then, as respects the effect of a valid abandonment on the rights in the property insured, the conference proposed to adopt the British and American rule of making the abandonment refer back to the time of the loss, as against the Continental system of making the transfer operative only from the date of the notice of abandonment. Finally, as to the freight of a properly-abandoned ship, it was proposed to follow for international purposes the American rule of dividing the freight of the voyage between shipowner and underwriter in the proportion of the distances run before the disaster and to be run thereafter, rejecting the British rule of complete transfer to the underwriter and the various Continental rules of proportional division between shipowner and underwriter.

(*b*) It was proposed to adopt the deductions set forth in the York-Antwerp rules as being suitable for international adoption in marine insurance contracts.

(*c*) As regards unseaworthiness and its effect on insurances on ships and goods, it was proposed in the case of ships to reduce materially the obligations of the assured as required by English and American law; to diminish the requirement from the absolute attainment of seaworthiness to the mere exercise of all reasonable care to make the vessel seaworthy. Even this attenuation did not appear sufficient, as it was proposed to degrade the performance of the already minimized warranty from being a condition of the insurance, and its non-performance from invalidating the policy. As to goods, they were proposed to be exempted from any warranty of seaworthiness of ship. Concerning negligence, it was proposed to hold the underwriter liable (subject to the new seaworthiness warranty) for any loss caused proximately by a peril insured against, although wholly or partly the result of the neglect of the assured, or his servants or agents, or by the wilful act of his servants or agents, or the inherent nature or unsoundness of the article insured.

(*d*) The conference proposed to adopt the British rule of making all the policies effectual, independently of the order in which they were effected, and of making all the underwriters entitled to contributions *inter se*. As regards the premium, it was proposed that no premium should be returnable where the risk has attached.

With the exception of those embodying the two suggestions named in par. (*a*), all the resolutions proposed were accepted by the conference. But it appears extremely unlikely that British and American underwriters will voluntarily consent to the practical annihilation of the seaworthiness warranty, and no less improbable that American and Continental assured will voluntarily accept the stricter rule of constructive total loss embodied in English law, when their national law enforces on the underwriter terms more favourable to the assured. The fewness of the international insurance markets of the world diminishes the need for uniform international regulations in this matter. The matter may be one for adjustment by variation in the rate of premium, but this is not certain.

The Glasgow conference of 1901 adopted the rules, after excepting time policies from the scope of the rule respecting seaworthiness. The rules are to be known as the Glasgow Marine Insurance Rules.

Course of business.

The usual procedure in the offer and acceptance of a risk is as follows:—The intending assured (principal or broker) offers the risk by showing to the underwriter a brief description of the venture in question, called in Great Britain a slip, in America an application. The underwriter signifies his acceptance of the whole or of a part of the value exposed to perils by signing or initialling the slip, putting down the amount for which he accepts liability. Or he may sign and issue to the assured (principal or broker) a similar document made out in his own office, called a covering note or insurance note. These documents are simply first sketches of the contract, *mémoires pour servir*, so imperfect that they can be explained only in conjunction with the contract in its completed form (the policy). In America it is not at all rare for insurances to be effected through applications alone without any policy existing. In Great Britain the existence of a policy is essential, slips and covering notes

being merely provisional agreements, binding in honour only, to issue policies on certain terms and conditions on receipt of the necessary information. One reason for insisting on a policy being issued for every risk is that a means of raising revenue by stamp taxes is thus created. In Great Britain the stamp duties under the Stamp Act, 1891, are as follows:—

Where the premium does not exceed ⅛ per cent. of the amount insured	1d.
Where the premium exceeds ⅛ per cent. of amount insured—	
(a) On any voyage, per £100 or per any fractional part of £100	3d.
(b) For any time not exceeding six months, per £100, &c., as above	3d.
(c) For any time exceeding six months, and not exceeding twelve months, per £100, &c., as above . . .	6d.

In consequence of this regulation, no time policy can be issued for a period exceeding twelve months. Policies or certificates of insurance coming from abroad are subject to the same duties, which should be paid within ten days after receipt in the United Kingdom. The shortness of the time allowed for stamping often prevents payment of the tax. These stamp regulations are very troublesome, and produce only a comparatively insignificant revenue. On small premium insurances the tax is so excessive that it drives business out of the country. A uniform tax per policy has been several times suggested, but these proposals have not yet been accepted by the Treasury.

The documents required to establish a claim for total loss are:—(1) Protest of master. (2) Set of bills of lading (endorsed if necessary, so as to be available to the underwriter). (3) Policy or certificate of insurance (endorsed if necessary). (4) In the United States: Statement of loss in detail. In the United States certified copies of Nos. (1), (2), and (3) are taken; but as none of these copy-documents can transfer possession to the underwriter, there is necessary for that purpose another document, viz., (5) Bill of sale and abandonment with subrogation to underwriter—that is, an assignment of all interest to the underwriter. In the absence of the *full* set of bills of lading, a similar document should be taken in Great Britain, especially in all cases in which salvage operations are likely to be undertaken. Such a document handed to a salvage association or a manager of salvage (whether acting for shipowner or for underwriter) settles the ownership of salved goods, and ensures that any claim for salvage expenses will be sent directly to the underwriter. This is from the assured's point of view desirable, and it greatly simplifies the management of salvage cases. As a claim for total loss cannot extend beyond the full amount insured in the policy, it follows that the documents required to substantiate such a claim must be supplied to the underwriter free of charge.

For the substantiation of a claim for particular average the following documents are required:—(1) Protest of master or log-book. (2) Set of bills of lading (cargo claims). (3) Policy or certificate of insurance (endorsed if necessary). (4) Certified statements in detail of actual cash value at destination of goods in *damaged* state, all charges paid. Certified statements in detail of sound value at destination of goods on same day, all charges paid. Or original vouchers of costs of repair of ship, all discounts, rebates, allowances, and returns deducted. (5) In the United States, subrogation to underwriters of damaged goods.

VI. BRITISH POST OFFICE INSURANCE.

In 1864 Mr Gladstone, then Chancellor of the Exchequer, advocated the extension of life insurance amongst persons of small means, and, encouraged by the remarkable success of the Post Office Savings Bank, then recently established, proposed that the services of the Postmaster-General should be enlisted in the promotion of insurance. The result was the passing of the Government Annuities Act, 1864. This Act authorized the Commissioners for the Reduction of the National Debt, for the first time, to insure a life without granting an annuity upon it, and enabled the Postmaster-General to act as the agent of the Commissioners in the issue of life policies and the grant of annuities. The limits of insurance were fixed at £20 and £100, and of annuities at £4 and £50; and the purchase of deferred annuities or old-age pay, by monthly, or even more frequent instalments, was sanctioned. The work was eagerly accepted by Lord Stanley of Alderley, the Postmaster-General of the day, and the machinery for putting the Act in action was elaborated by Mr Scudamore of the Post Office and Sir Alexander Spearman of the National Debt office. The business was commenced on the 17th of April 1865. By the end of the year 560 policies of insurance had been issued, and 94 immediate and 54 deferred annuities granted. In the first twelve months these figures had increased to 809 policies and 230 annuities.

Mr Fawcett's reforms.

The opportunity thus given of insuring through the Post Office with Government security was not, however, embraced with the warmth which had been anticipated. In 1882, when Mr Fawcett, then in office, examined the subject, he found that the average number of policies of insurance granted annually during the seventeen years which had elapsed was under 400—less, in fact, than during the first twelve months of the system. The purchase of annuities had increased slightly, but the business was transacted chiefly in immediate annuities, and hardly, therefore, indicated any progress in provision for old age by means of early savings. Mr Fawcett procured a Select Committee of the House of Commons on the subject. Before this Committee Mr Cardin, then Assistant Receiver and Accountant-General of the Post Office, propounded a scheme for combining the annuity and insurance business of the Post Office with that of the savings bank. The Committee recommended the adoption of this scheme, together with some enlargement

of range and some relaxation of conditions. The recommendations of the Committee were embodied in the Government Annuities Act, 1882, which came into operation on the 3rd June 1884, and which forms the basis of the present system.

Any person between 14 and 65 can now insure through the medium of the Post Office Savings Bank for any amount from £5 to £100; and the life of a young person between 8 and 14 can be insured for £5. Through the same channel can be purchased annuities, immediate or deferred, from £1 to £100, on the life of any person from 5 years old upwards. Old-age policies, that is, policies securing payment of a specific sum either at the expiration of a fixed period (varying from 10 to 40 years), or upon the attainment of a certain age, or sooner in case of death, can also be obtained. Policies for a fixed period can only be purchased by a single payment, but in all other cases the purchase can be effected by payment either of a lump sum or of annual instalments. Further, all purchases are effected through the Post Office Savings Bank. As soon as a contract is completed, the purchaser is required to pay the first instalment to his account in the bank, or, if he has no account already, to open an account for the purpose. This and all further instalments are then transferred by the Postmaster-General, as they become due, to the credit of the National Debt Commissioners; all the purchaser has to do is to keep his banking account in funds; he can pay his savings into the bank when and as he pleases. So, also, when old-age pay, secured either by a deferred annuity or an endowment policy, becomes due, it is paid to the account of the purchaser; and, if it does not cause the sum standing to his credit to exceed the statutory limits, it can remain there earning interest, and be drawn out in such amounts as may be convenient from time to time. The purchaser has also the advantage of the ubiquity of the Post Office Savings Bank. He can make his deposits, and can draw out his old-age pay when it becomes due, at any one of the 12,900 post offices where savings bank business is transacted. He can even, if his savings are made from day to day, use the penny stamp slips introduced by Mr Fawcett, affixing a stamp whenever he has a penny to spare, and paying in the slip when it is worth a shilling. In short, every advantage open to the ordinary depositor in the Savings Bank is placed at the service of the working man or woman who wishes to secure old-age pay, or to have a small sum to aid those who may suffer pecuniarily from his or her death. Even the reluctance of many persons to submit themselves to medical examination is tenderly regarded. A policy for any sum up to £25 may, if the information afforded is satisfactory, be obtained without a doctor's certificate, on condition that, if death happens during the first year, only the premium paid is returned, and if during the second year, only half the sum insured is paid. As regards old-age pay, a purchaser can, by adopting a slightly higher scale of payment, secure the return of his purchase money if at any time before the annuity falls in he repents of his bargain. Further, employers of labour and friendly societies can, on behalf of their workmen or members, make all the payments necessary to buy an insurance or annuity, and recoup themselves out of wages or members' contributions.

The Act of 1882 directed that the tables upon which annuities and policies of insurance are granted should be revised from time to time; and in February 1896 new tables reducing the rates of annual premiums, and giving greater facilities for old-age insurance, were issued. The rates are now but very slightly (less than 3 per cent.) higher than the average rates of the larger insurance offices. But the expense of small insurance business must necessarily be above the average, and it is fairer to compare the Post Office rates with those of the office which stands pre-eminent in the insurance of the working classes. Such a comparison shows that up to the age of 40 a life insurance can be effected with the Post Office at a cheaper rate than with the Prudential Insurance Company; between 40 and 60 the advantage is slightly on the side of the company.

Nevertheless, the endeavour to popularize the provision for old age and death through the machinery of the Post Office must be pronounced a failure. In 1885, the first complete year after Mr Fawcett's improvement took effect, 103 deferred annuities and 457 insurance policies were granted; in 1898, 164 deferred annuities and 731 policies. The increase of business, measured in percentages, is no doubt appreciable, but the figures themselves are so small as to make such a comparison trivial. If we compare the two periods, before and after Mr Fawcett's reforms, we find that between 17th April 1865 and 2nd June 1884 (about 19 years) 7064 policies of insurance, amounting to £557,625, were issued, and between the latter date and the end of 1898 (about 14 years) 11,581 policies, amounting to £620,266. For the whole period the figures are 18,645 policies for £1,177,891. During the same time 3144 contracts for old-age pay, amounting in all to £64,378, were made. When we contrast with this sum total the fact that in 1898 alone 1,333,395 new accounts were opened in the Post Office Savings Bank, and more than £37,000,000 deposited in the bank in the course of the year, it becomes apparent that, while the Savings Bank has reached the mass of the population, insurance against old age and death through the Post Office has not.

In 1894 Mr Lang, the Controller of the Post Office Savings Bank, and Mr Cardin, giving evidence before the Commission on Old-Age Pensions, ascribed the small insurance and annuity business of the Post Office to the want of a personal canvass. They pointed out that there had been some temporary increase in insurance through an appeal to the Post Office employés themselves, and they suggested that something might be done if the masters of the elementary schools could be induced to interest themselves in recommending to their scholars and the parents of their scholars the advantages offered by the Post Office. It was also pointed out that the friendly societies might, if they were so disposed, act as intermediaries between their members and the Post Office, and thereby, as it were, reinsure their risks with the Government; but it was added that all overtures of this nature to the societies had failed, apparently from the fear—quite groundless—of introducing Government control of the societies' affairs. There may, indeed, be another reason for the failure of the deferred annuity system. The insurance of old-age pay is not at present popular even amongst the members of friendly societies, or even in Germany, where it has been given to the workmen largely at the expense of other people. Insurance against death, sickness, and accidents appeals to the young working man; but old age is too far off to be an object of solicitude, or to warrant the foregoing of the many pleasant things that money can give. However, if at any time opinion changes, the Post Office stands ready to make foresight or philanthropy easy. Though no great results have been achieved, a machinery has been established which works with perfect smoothness, and which may some day be of service to the nation.

(R. H*.)

Interlaken, a Swiss village, 1864 feet above the sea, in the canton of Bern, between the lakes of Thun and Brienz. It is 17½ miles from Thun by rail (itself 19¼ miles from Bern), while from Interlaken cog-wheel lines run to Lauterbrunnen (8 miles), up to the Schynige Platte (4½ miles) and to Grindelwald (12½ miles). In different parts of the church of the old Monastery various denominations now have places of worship. The population of Interlaken proper (*i.e.*, all on the left bank of the Aar) was 2958 in 1900. The town of Unterseen (2612 inhabitants in 1900) was built on the right bank of the Aar in 1280 by Berchtold von Eschenbach.

International Arbitration. See ARBITRATION, INTERNATIONAL.

International Law (Private).—There is in every territory the law of the land, or territorial law, by which the courts decide all cases that include no circumstances connected with any foreign territory. Often, however, such a circumstance suggests the question whether justice does not require that the law of some other territory shall be applied. Thus the Gretna Green marriages, by which English unions escaped the necessity of banns or the consent of parents or guardians, suggested the question, which was answered in the affirmative, whether even in England their validity ought not to be tried by the law of Scotland, where they were celebrated. Often, again, the question is suggested whether justice does not require that the courts of law should allow some effect to foreign legal proceedings, such as a judgment obtained or litigation pending abroad. Such questions as these are answered by private international law, which, since both laws and legal proceedings are emanations of public authority, may be defined as the department of legal science which is concerned with the effect to be given in the courts of law of any territory to the public authority of another territory. The extradition of criminals is also an effect given to foreign public authority, but rather by the Government which surrenders the criminal (see EXTRADITION) than by the courts of law, whose only function is to check the surrender so far as the domestic legislation allows them to do so. If private international law were defined as the effect to be given by any mode in one territory to the public authority of another, extradition would be included in it, as is often done; but since the principles governing extradition have little to do with those applicable to the other cases, it seems best to treat it as a separate department of law, as is generally done in England.

Comity of Nations.—In the 17th century the Dutch jurists Paul and John Voet and Huber brought forward a view which has since been largely adopted in England and the United States, namely, that the effect given by courts of law to foreign public authority is only due to the comity of nations, but for which every possible question before them would have to be decided by the law of the land. Comity, in that phrase, may only be intended to express the truth that foreign public authority has no inherent effect, without denying that the effect which domestic public authority allows to it is dictated by justice. But the limitations implied in the popular meaning of comity have sometimes been made the ground for deciding questions of private international law in the manner supposed to be most for the interest of litigants belonging to the territory; the phrase is consequently reprobated by most Continental writers, and had better be dropped. The justice on which private international law is founded acknowledges no interest but the general one of intercourse between persons sharing a common civilization in different countries. This interest, as manifesting itself in the domain of law, it seeks to satisfy, and it is therefore a true legal justice, rightly classed under *law*, *droit*, *recht*, *diritto*, *derecho*, and other corresponding terms.

Of the two words which, together with *law*, make up the title of our subject, *private* is justified by the fact that its application is between litigants in courts of law, and not between Governments except so far as they may be such litigants. *International* (although *interterritorial* would be better) is justified by the facts that public authority, which may be internationally foreign, has to be considered, and that Governments display a great interest in the question by concluding treaties about it, and occasionally even by suspending diplomatic relations when a court of one country has applied to the subjects of another a rule which the Government of the latter deems unjust. But those who think that the primary division of law should be into public and private, and not into international (or interterritorial) and territorial, object to the order in which the three words of the name are usually placed, and call the subject "international private law."

Conflict of Laws.—This is another name for our subject, and indeed an older one than "private international law," besides being still much used. But although laws may differ, they cannot properly be said to conflict, unless each can lay a just claim to application in the same circumstances. Now this does not happen. The justice which points out that in certain cases effect ought to be given in one territory to the laws or legal proceedings of another, really traces the limits of laws and legal proceedings in space; and the tracing of limits is rather the prevention of conflict than its solution. Savigny has well pointed out that our subject is analogous to the determination of the limits of laws in time, which has to be made when the just application of a new enactment is to be distinguished from the *ex post facto* application which cannot justly be allowed it. The truth which is aimed at in the phrase "conflict of laws" is that the main problem of our subject is the selection of a law for each given case; but different laws are candidates for selection, not from anything in them as laws, but from differing opinions about the justice of the case. From this selection, again, will be seen the contrast between private international law and attempts at the assimilation of the laws of different countries. To a great extent such assimilation is desirable, especially in mercantile law, but it must always be limited by different views of social order and differences in national habits of thought and action. So far as it is realized, private international law comes to an end with the occasion for selection.

Territory.—This word, as entering into the definition of private international law, does not imply a separate state, whether sovereign or semi-sovereign; it includes every geographical area having a separate legal system, England and Scotland, as well as France or Germany. The case of the Gretna Green marriages above referred to illustrates the necessity of rules of private international law between all such, as well as between areas internationally foreign to one another; and indeed the rules are so applied, and in the language of our subject, the area of every separate legal system is foreign to every other such area. Only where a rule contemplates a person as attached more or less permanently to a particular territory, the tie which so attaches him to it may be either nationality or domicile if the territory is a separate state, as France; but it can only be domicile if the territory is combined with others in one state. Nothing but domicile can distinguish British subjects as belonging to England, Scotland, or Jamaica, or citizens of the United States as belonging to New York or Pennsylvania.

Legal rules must have relation to the physical and mental characters, and the consequent habits of action, of

the populations for which they are intended; they would not satisfy legal justice if they endangered social order as understood and desired by those populations, or if they failed to give due effect to the expectations of parties. This must be true for the rules of private international law as well as for those of any territorial law, and it leads us to ask whether the differences which preclude the universal identity of the latter must not also preclude the existence of the former. The answer is: (1) That where circumstances connected with different territories are concerned, wise rules for the selection of a law will generally give better effect to the expectations of the parties than an exclusive adherence to the territorial law of the court; (2) That the circumstances in which a foreign law is held to apply are exceptional as compared with those in which the domestic law applies, and naturally occur oftenest among the persons and in the affairs having most of a cosmopolitan character, so that the moral shock of applying to them a law founded in a foreign social order is greatly attenuated; (3) That throughout Christendom (to which Japan has been added for legal purposes) there does exist, though not an identity, yet a considerable similarity in views of social order and prevalent habits of thought and action. Within the same geographical limits there also exists another requisite for the working of a system of private international law, namely, a mutual confidence between countries in the enlightenment and purity of their respective judicatures, to whose proceedings the respect enjoined by the rules of our subject is to be mutually given.

Even within the geographical limits just mentioned there are certain differences on points of social order, especially on marriage or divorce, which have hitherto prevented a complete agreement being attained in the rules of private international law. But no attempt has ever been made to establish any system of the kind as between Christian communities and Mahommedan or other polygamous ones, or between countries enjoying a Christian standard of civilization and those, of which China may be taken as an example, which, whether polygamous or not, do not inspire the necessary confidence in their judicatures. In Turkey and other Eastern countries (in which designation Japan is no longer included for purposes of law) Christians are placed by treaty under the jurisdiction in civil matters of their respective consuls. When in the courts of Christian countries Eastern persons or circumstances connected with Eastern laws have to be dealt with, the peculiar institutions of those countries are not enforced; and while in other respects the judges may be assisted by some of the rules of private international law, especially such as have for their object to carry into effect the reasonable intentions of parties, yet those rules are not applied as parts of an authoritative system.

Rules for the selection of the territorial law to be applied in the different classes of cases, or for the recognition of foreign legal proceedings, have sometimes been made the subject of international treaties, and have often been enacted by territorial legislatures. England possesses a few such enactments, as in the Bills of Exchange Act, 1882, and many other countries possess them to a much larger extent in their codes. Where such enactments exist, or where treaty stipulations have been made and the territorial law makes such stipulations binding on the judges, the courts of law must obey and apply them as they must obey and apply any other part of the law of the land. If, as in England, judicial precedents are held to be binding, so that the law of the land consists in part of judge-made law, a similar result is produced; an English court must follow English precedents on the application of foreign law or the refusal to apply it, to the same extent to which it would be bound to follow them on any other point. So far as our matter remains open for a judge, he has, to assist him towards a just decision, the treaties, written laws, and judicial precedents of other countries as examples, and a vast literature which has grown up in all Christian countries. That this apparatus does not always furnish concordant results is due, not only to the divergences on points of social order above referred to, but also to the different bases of the legal systems with which the respective Governments and writers have been familiar. The legal systems of different countries have been founded on Roman law, feudal law, English common law, and still other bases. The arguments of lawyers are affected by the prepossessions thence arising, and they have consequently failed to arrive at so much agreement on the rules of private international law as would have been compatible with the conditions and modes of life and action surrounding them. It is possible that lawyers, whose tendencies are usually conservative, have been left a little behind on the roads by which the modern world seems to be travelling towards uniformity. But the general acceptance of a complete body of rules on private international law is a goal well within sight, and it is probable that for its attainment we must look to international treaties concluded under the joint direction of professional and non-professional minds.

The most remarkable steps that have been taken in or towards the conclusion of such treaties as have been mentioned were those initiated, to its high credit, by the Government of the Netherlands. That Government first moved in the matter in 1874, but it was not till 1893 that it succeeded in assembling at The Hague the official representatives of Germany, Austria, Hungary (separately represented, because having different laws from Austria), Belgium, Denmark, Spain, France, Italy, Luxemburg, the Netherlands, Portugal, Rumania, Russia, and Switzerland. A second conference was held at the same place in 1894, at which the same Powers were represented, with the addition of Sweden and Norway, also separately represented, as differing in their laws; and the result was a considerable, though far from complete, body of rules of private international law, which the delegates of all the sixteen countries agreed in submitting to the appreciation of their respective Governments, subject to the reservations expressed in the minutes of the sittings. These rules related to the conditions for the validity of marriage, the effects of marriage on the status of the wife and children, divorce and judicial separation, guardianship, bankruptcy, wills and succession to property on death, and several points of judicial procedure. On 14th November 1896 a treaty embodying seventeen out of the twenty articles on judicial procedure (to be found at length in the *Revue de droit international et de législation comparée*, tome xxviii. pp. 574–579) was signed at The Hague by eight of the Powers above mentioned, and all the others have since acceded to it. A third conference met at The Hague in 1900, and prepared draft treaties completing the subjects of marriage, divorce, and succession on death, and adding that of the guardianship of minors. These drafts, as well as the remainder of the work of the preceding conferences, await adoption by the Powers represented. Next in importance among combined official efforts should be mentioned the congress of seven South American States at Montevideo in 1888–89, which on many branches of private international law drew up rules intended for adoption by treaty on that continent. And though the Institute of International Law, founded in 1873, is not an official body, a high place in this subject must be given to its discussions and votes, in which eminent lawyers of almost every country have participated.

In considering the particular rules of private international law which are most consonant with justice, perhaps *Nationality; domicile.* the most obvious cases which present themselves for admitting foreign circumstances to influence the decision of a judge are those in which rights are so connected with the person of an individual that the justice of deciding on them by a law having relation to his person speaks almost for itself. Hence arises the notion of a personal law, which must be that either of the person's political nationality or of his domicile, these being the only circumstances that for the time being are fixed for the individual irrespectively of the spot where he may happen to be, and of the transaction in which he may happen to engage. Political nationality, or the membership of a separate international state, with the circumstances of parentage or place of birth on which it depends, and its change by naturalization or otherwise, belongs to public international law, though it may produce its effects in private law. Domicile, though it occasionally produces effects in public law, belongs originally to private law. It is residence considered technically, residence viewed in the light of technical rules intended to secure that each person shall have but one domicile at a time, as is necessary if it is to be the criterion of personal law. For that purpose it is distinguished into domicile of origin and acquired domicile. The former is that which is attributed to every one at his birth, in general the domicile of the father at the date of the birth; the latter is that which a person *sui juris* acquires by changing either his domicile of origin or any other domicile he may have previously acquired, which change must be made *animo et facto*, by intentionally taking up a new principal and permanent residence. Of the subsidiary rules the chief are that the domicile of a person under age follows that of his father, and that of a wife follows the domicile of her husband, through all their changes respectively. In and long after the Middle Ages domicile was the unquestioned criterion of the personal law, so far as such a law was allowed to be applied in preference to the territorial law of the court. Political nationality had not then been defined with the clearness which now marks it, and the variety of laws which existed within most of the larger states, together with the narrow geographical range within which intercourse was usually restricted, caused questions about the conflict of laws to arise with much the greatest frequency between subjects of the same state, who could for the present purpose be distinguished only by the provinces in which they were domiciled. Now, all these conditions being changed, there has been on the continent of Europe a wide movement towards adopting nationality as the criterion of personal law. Certainly it has the advantage of being seldom doubtful, while the determination of domicile gives rise to many of the most difficult and most expensive lawsuits, depending as it often does on evidence about the acts and intentions of a person in changing his residence or as between two residences, sometimes even about such acts and intentions on the part of a person long dead, from whom it may be alleged that a domicile of origin was derived. The British dominions, however, include, besides England and Scotland with their different laws, other legal provinces governed by what in the main is English law, though more or less varied by local legislation (Ireland, Australia, West Indies, &c.), Roman-Dutch law (Ceylon, Cape, Natal, Guiana), the French codes (Mauritius), and a code largely based on older French law (Quebec), not to mention India, with its copious and independent legislation, tempered by the large application, still necessarily made there, of Mahommedan and Hindoo laws. Domicile, and not political nationality, therefore, continues to be the only possible criterion of personal law in a very large part of the cases which come before the English courts of justice—a circumstance which no doubt has contributed to the preference of it as a criterion even in other cases which those courts still display.

Formerly, and as late as Lord Eldon's time, or even later, the English courts, peculiar in this respect, held that the competency of a person to contract depended on the law of the place where the contract was made. This doctrine, carried to America with the rest of *Capacity; status.* English jurisprudence, still maintains in the courts of the United States a struggle with the doctrine of personal law as governing capacity and status, which now prevails in England, as in most other countries —such personal law being in England based on domicile. Thus the capacity of a party to enter into a contract, whether it be disputed on the ground of his age, or, in the case of the contract of marriage, on the ground of his consanguinity or affinity with the other party, will be decided in England by the law of his domicile. Guardians, curators, and committees of foreign minors or lunatics, deriving their authority from the law or jurisdiction of the latter's domicile or nationality, can sue and give receipts in England for their personal property. The English court will not decree the divorce of persons not domiciled within its jurisdiction, and it will recognize foreign divorces if and only if they have been decreed by a jurisdiction to which the parties were subject by domicile or nationality. The legitimation of a child by the subsequent marriage of its parents will be held in England to depend on the law of its father's domicile or nationality. In France the Code Napoleon, Art. 3, says that "the laws concerning the status and capacity of persons govern Frenchmen even though residing in foreign countries"; and the French courts, by analogy, determine the status and capacity of foreigners by the law of their nationality. The Italian code, preliminary Art. 6, says that "the status and capacity of persons, and their family relations, are governed by the law of the nation to which they belong." The German statutory provisions belonging to private international law are contained in the statute enacting the code, of which Art. 7 says that "the capacity of a person shall be determined according to the law of the state to which he belongs," but adds, "If a foreigner enters in Germany into a transaction for which he is incapable or has only a restricted capacity, he is to be treated for that transaction as being so far capable as he would be by the German legislation. This, however, does not apply to transactions with regard to rights of family or of succession, or to those disposing of foreign immovable property." It may be added that Art. 13 makes it clear that marriage stands on the same footing as contracts relating to the family, capacity for it by his or her national law being required from each party. In a spirit similar to that which dictated the German enactment, the French courts have not generally allowed a Frenchman to suffer from the incapacity, by his personal law, of a foreigner who contracts in France, when the foreigner would have been capable by French law, and the Frenchman was in good faith and without great imprudence ignorant of his incapacity. Lately a disposition has been shown to limit this protection of nationals to the case in which the foreigner has been guilty of fraud. English courts usually hold themselves to be more stringently bound by rules, whether those enacted by Parliament or those which they have adopted for themselves; and if they should continue to profess the doctrine that capacity depends on the law of the domicile, it is not probable that they will deem themselves entitled to make exceptions for the protection of persons contracting in England with foreigners not enjoying such capacity. The point furnishes an illustration of

the fact that to deal satisfactorily with so complex a subject as private international law requires the assistance of the legislature, which again cannot be given with full utility unless uniform provisions, to be enacted in different countries, are settled by international convention.

Another ground for the application of a personal law is furnished by the cases in which masses of property and rights have to be dealt with collectively, by reason of their being grouped around persons. The principal instances of that kind are when it is necessary to determine the validity and operation of a marriage settlement or contract, or the effect of marriage on the property of the husband and wife in the absence of any express settlement or contract, and when property passes on death, either by a will or by intestate succession. These matters, at least when the property concerned is movable, are generally referred to the personal law of the husband at the time of the marriage, or to that of the deceased respectively; but about them, besides the question between domicile and nationality, there arises the question whether immovable property is to be included in the mass governed by the personal law, or is to follow the territorial law of its own situation (*lex situs*). Here we touch the distinction between *real* and *personal* statutes which arose in the Middle Ages, when the local legislation of the free cities was contrasted, under the name of statutes, with the general Roman law. That distinction did not bear the same character at all times, but in the 16th century, under d'Argentré, it acquired its most developed form, absorbing all laws into one or other of the two classes, and giving a vast extension to the real class, for which was claimed exclusive application to immovables situate in the territory of the law. In accordance with this system, the highly feudal character of which was very sympathetic to English jurisprudence, English practice has refused to include English immovables in the mass to be dealt with as a unit on marriage or death. But it refers the validity and operation of a marriage settlement, at least as to movables, and the effect of marriage, in the absence of express contract, on the movable property of the husband and wife, to the law of the husband's domicile at the time of the marriage, called the matrimonial domicile. And with regard to the succession to movables on death, it adopts the principle of massing them irrespectively of their situation, so far as is permitted by the peculiar system under which the property in movables situate in England does not pass directly to the legatees or next of kin, but to the executors or administrators, who are charged with the duty of paying the debts of the deceased and distributing the beneficial surplus. The validity of a will of movables, otherwise than in respect of form (about which more hereafter), and the rights, whether under a will or under an intestacy, in the beneficial surplus arising from them, are determined in England by the law of the testator's last domicile. On the points here glanced at, the decisions in the United States generally agree with those in England, only allowing the pecuniary relations of a married couple, in the absence of express contract, to be varied by a change of domicile, notwithstanding that such change is in the husband's exclusive power, instead of maintaining them as fixed by the matrimonial domicile. On the continent of Europe partisans of a variation after the marriage are scarcely to be found; but as between the nationality and the domicile of the husband or of the deceased, and on the question whether the mass to be governed either by nationality or domicile, on marriage or on death, includes immovables situate under a different law, the division of opinion, legislation, and practice is considerable and intricate.

Lex situs, lex loci actus, lex loci contractus, lex fori.—The law of the territory in which they are situate (*lex situs*) is generally applied to the property in particular things, whether movable or immovable, so far as they are not included in any mass grouped round a person; in England, therefore, always to immovables. In drawing up documents and conducting ceremonies public functionaries must necessarily follow the law from which they derive their authority, wherefore the law of the place where any public document is entered into, or any public ceremony performed (*lex loci actus*), is the only one that can be followed in its external form. This maxim applies to the forms of notarial acts, and to that of marriage celebrated with the official concurrence of clergymen, registrars, and so forth. And since documents and ceremonies entered into without official concurrence are rarer on the continent of Europe than in England, the inevitableness of the form of the *lex actus*, when such concurrence is had, has generally led to the form being also held sufficient whenever the affair comes to be inquired into later. Nor in England has the sufficiency of the form of the *lex loci actus* for the celebration of marriage ever been doubted, but a will made by a notarial act in accordance with that law was not admitted. Disregarding the distinction between external form and internal validity and operation, a will of English land could not take effect unless made in English form (that is, since the Wills Act of 1837, with two witnesses), and a will of personal estate could not be admitted in England to probate unless made in the form of the law of the testator's last domicile. But now, by Lord Kingsdown's Act, passed in 1861, there are given for wills of personal estate made by British subjects, besides the form of their last domicile, three alternative forms, namely, the form of the place of making the will, that of the testator's domicile at the time when it was made, and that of the part of the British dominions where he had his domicile of origin—only the first of the three, however, being offered when the will is made in the United Kingdom; and no will is to be revoked or invalidated by a change of the testator's domicile after making it. The law of the place of contract, *lex loci contractus*, is distinguished into that of the place where the contract is entered into, *lex loci contractus celebrati*, and that of the place where it is to be performed, which, from the particular case in which the performance consists only in a payment, is called *lex loci solutionis*. To the first of these is generally referred the formal validity of a contract, so far as entered into without the intervention of a functionary, and therefore not covered by the principle of the *lex loci actus*, and so far also as the performance is not tied to any particular place. For example, the form for contracting marriage, whether with official intervention as in England, or by private and even oral contract as in Scotland, depends, both as to necessity and as to sufficiency, on the law of the place of contracting it. But as to the internal validity, interpretation, and operation of a contract, there has been and still remains much difference of opinion between the laws of the place of contracting and of that of stipulated performance; the former being supported, among other grounds, on some texts of Roman law which Savigny has shown to have been misunderstood, while the latter agrees much oftener with the intention of the parties. The English decisions do not adhere closely to either of those laws, but while repeating much of the traditional language about the *lex loci contractus*, they aim at doing substantial justice by referring a contract to that place with which its matter has the closest connexion, or which the intention of the parties points out. In matters of legal procedure every court follows its own practice exclusively (*lex fori*), as, for instance, whether the remedy on a contract shall be damages or specific performance, and whether a judg-

ment may be executed against the person or only against the property of a party. A point much disputed under this head is whether the time of limitation of actions shall, as held in the United Kingdom, be decided by the *lex fori*, as an incident to the procedure, or by the *lex loci contractus* in one of its varieties, as an essential modality of the obligation.

It must not be supposed that the law of the land, the proper territorial law of the court which has to deal with a case in which foreign circumstances arise, always gives way to the law pointed out by the general maxims which even that particular court accepts with regard to the law of the domicile or state, or that of the situation of property or the place of contract. All rules for the application of foreign laws are subject to an exception commonly called that of *public order*, *i.e.*, where such application would interfere with essential principles of morality or policy received in the territory. This reservation is usually made in general terms where legislation on private international law is attempted, as in Article 6 of the Code Napoleon, and preliminary Article 12 of the Italian code; but the courts have to administer it, as they have also in England and other countries where it rests only on judicial practice, and the greater or less extent given to it is one of the causes of the uncertainty and want of uniformity in our subject. One example often quoted is the refusal of the courts in all Christian countries to give effect to polygamous marriage, but this case goes deeper still, for none of the countries in which polygamous marriage exists is allowed to enter at all into the communion of private international law. All, so far as Great Britain has settled legal relations with them, are among those in which British subjects live under consular protection and jurisdiction, or (in Egypt) under that of the Mixed Courts. A better instance is afforded by the refusal of courts, normally within the pale of European legal communion, to recognize divorce as dissolving a marriage, notwithstanding that it has been decreed under the personal law. As another instance, there can be little doubt that an incapacity to marry imposed by the personal law in virtue of religious vows or orders would be disregarded by the English courts in the case of a person marrying in England. Again, it is established in England that damages cannot be recovered for a *tort* unless the act complained of was a wrong both by the law of the country where it was done and by the law of England; and Article 12 of the statute enacting the German code is in accordance with that doctrine. Now the law of the country where the act is done would naturally give the standard for measuring its legal consequences, and it seems to be due to the connexion which laws qualifying acts as wrongs have with public order that respect for that law is tempered by respect for the law of the countries in which it is invoked; but Article 8 of the Belgian code refers the liability for torts to the former law without any restriction.

In the rules which have passed before us in the foregoing general review it is easy to perceive a leading motive—that of securing, so far as public order allows, the certainty and stability both of personal and of business relations in the international or interterritorial intercourse which has always accompanied civilization, but is now especially frequent and extensive. It has been attempted to erect this motive into a guiding principle of law, laying down that rights once accrued in any territory, or sometimes, it is said, by virtue of any territorial law, are to be recognized and enforced, subject to the requirements of public order, in any other territory in which they may be invoked before a court of justice. From this, which may be called the principle of the acceptance of foreign rights, it is claimed that the rules of private international law are to be deduced, and that by their consonance with it any such rules are to be tested when proposed. The difficulties of the subject, however, do not admit of being unlocked by so simple a key. They meet us again when we inquire in what territory, or by virtue of what territorial law, a particular alleged right has accrued. Persons belonging by domicile or nationality to A enter in B into a contract to be performed in C; where and by virtue of what law does either acquire a right against the other? Is it to be in or by the law of their homes, where they are normally, though not always necessarily, to be sued? Or of the country where they contract, which for various purposes, as those of police, but not for all purposes, has the control of them when they contract? Or of the country where their contract is to be performed, under a similar control by which, perhaps extending to the very acts of performance, they or their agents may be brought by the operation of their contract? Evidently we cannot apply the principle to guide us in our choice of a law till the very problem which that choice presents has first been solved. There is, however, one case in which the principle of the acceptance of foreign rights leads to a conclusion, namely, where the right has been declared by the judgment of a competent court, which may have been given in an ordinary case, presenting no question of private international law, but in which, if such a question arose, it has been solved by choosing the law and basing the judgment on it. The rule in England and in many other countries as to foreign judgments is that the judgments of competent courts in other territories (foreign in the sense of civil law, whether politically foreign or not) are to be enforced without reopening the merits of the questions disposed of by them. In some countries, however, a foreign judgment is examinable on its merits before being enforced. This was formerly the unquestioned rule in France, though the practice there seems to be now turning the other way. In the system adopted in England everything turns on the competence. For judgments *in rem*, declaring or disposing of the property in a thing, the test of competence is that the thing, whether movable or immovable, was within the territory of the court. Judgments which declare the status of a person, as with regard to marriage or majority, are competent if the person was subject to the jurisdiction by nationality or domicile. The property or the status is treated as being what has been so declared or decreed. For judgments *in personam*, decreeing the payment of a certain sum, the test of competence for the present purpose is again that the person against whom it was pronounced was subject to the jurisdiction by nationality or domicile; the judgment may then be sued on as giving of itself a good title to the sum decreed by it to be paid. For domestic purposes the competence may exist on quite other grounds. By its own territorial law a court may be authorized to entertain a suit *in personam* because the plaintiff possesses its nationality, as by Article 14 of the Code Napoleon, or because the contract sued on was made or was to be performed in the territory, and so forth. But judgments based on these grounds will not be enforceable outside the territory. Here we touch the root principles of our subject. The distinction between domestic and international grounds of competence can only be explained by the history of law, and we come in sight of the fact that the rules of private international law rest finally on conventions which could not have existed if the civilization of different countries had not so much that was common in its origin and in the course which it has followed, but which suit the life of those countries just because that life is itself another outcome of those common antecedents.

Foreign judgments.

The best authority on the history of private international law to the end of the 18th century is LAINÉ, *Introduction au droit international privé*, 2 vols., Paris, 1888. For modern progress the most copious materials are to be found in the *Revue de droit international et de législation comparée*, Brussels, from 1869; the *Journal du droit international privé et de la jurisprudence comparée*, Paris, from 1874; and the *Annuaire de l'institut de droit international*, Paris, from 1877. The most comprehensive general treatise is that of von Bar, of which the 2nd edition appeared at Gottingen in 1889, and has been translated: *The Theory and Practice of Private International Law*, by L. v. BAR, 2nd edition, translated by Gillespie, Edinburgh, 1892. Other works, many of great merit, are numerous in all languages; but in this, as in every department of law, the first place for England and the United States must be given to the different Law Reports, since in those countries it is not in the study but on the bench that the highest legal intellect is usually displayed, and the judgments delivered are often essays on the points involved. The following works, however, among others, treat the subject from the English or United States point of view:—STORY. *Commentaries on the Conflict of Laws, Foreign and Domestic*, 8th edition, by Bigelow. Boston, 1883.—WHARTON. *A Treatise on the Conflict of Laws or Private International Law*, 2nd edition. Philadelphia, 1881.—WESTLAKE. *A Treatise on Private International Law, with Principal Reference to its Practice in England*, 3rd edition. London, 1890.—FOOTE. *A Concise Treatise on Private International Jurisprudence, based on the Decisions in the English Courts*, 2nd edition. London, 1890.—DICEY. *A Digest of the Law of England with Reference to the Conflict of Laws, with Notes of American Cases* by J. B. MOORE. London, 1896. (JNO W.)

Interpolation.—If u denote any function (known or unknown) of a variable quantity x, and if the values of u for a series of values of x be given, it is the business of *Interpolation* to deduce from these data the values of u for intermediate values of x. We shall deal first with the case in which the given values of u correspond to equidifferent values of x. Explanation will be facilitated by an example:—

SPECIMEN TABLE.

$u=1000\times 10^x$. $\qquad x=\log\frac{u}{1000}$.

x	u	First Differences.	Second Differences.	Third Differences.	Fourth Differences.	Fifth Differences.
·0	1000					
		259				
·1	1259		67			
		326		17		
·2	1585		84		6	
		410		23		−3
·3	1995		107		3	
		517		26		+7
·4	2512		133		10	
		650		36		−3
·5	3162		169		7	
		819		43		+5
·6	3981		212		12	
		1031		55		+1
·7	5012		267		13	
		1298		68		+8
·8	6310		335		21	
		1633		89		
·9	7943		424			
		2057				
1·0	10,000					

In the above table the first column contains a series of values of x proceeding by increments of ·1. The second column contains the corresponding values of u. By subtracting each of these from the next we obtain the First Differences, or Differences of the First Order, which form the third column. Each of them is written opposite the space between the two values of u whose difference it is. In the same way the Second, Third, Fourth, and Fifth Orders of Differences, which form the remaining four columns, are obtained, each from the column which precedes it. In general the successive orders of differences diminish rapidly, and the process is to be continued till they either vanish or become small and irregular.

Notation.—Any one of the given values of u being denoted by u_m, the preceding and following values will be denoted by u_{m-1} and u_{m+1}. Thus any five consecutive values may be called u_{-2}, u_{-1}, u_0, u_1, u_2. Δu_m denotes $u_{m+1}-u_m$; $\Delta^2 u_m$ denotes $\Delta u_{m+1}-\Delta u_m$; $\Delta^3 u_m$ is $\Delta^2 u_{m+1}-\Delta^2 u_m$; and so on.

Putting $f(x)$ for u, and taking h to denote the constant increment of x, we have by definition $\Delta fx=f(x+h)-f(x)$. We may accordingly write

$$(1+\Delta)f(x)=f(x)+\Delta f(x)=f(x+h),$$

and, by repeating this operation n times,

$$(1+\Delta)^n f(x)=f(x+nh). \quad . \quad . \quad . \quad . \quad . \quad (1)$$

We shall now extend the definition of Δ by removing the implied restriction that n is an integer; and shall adopt equation (1) with n unrestricted as our working definition of Δ. It is easy to show that Δ conforms to the ordinary laws of combination of algebraic symbols. Hence, by the binomial theorem, we have from (1)

$$f(x+nh)=\{1+n\Delta+\frac{n(n-1)}{2}\Delta^2+\frac{n(n-1)(n-2)}{2\,.\,3}\Delta^3+\&c.\}f(x) \quad (2)$$

which, when n is fractional, is a formula for interpolation, and is the best known of all the formulæ for this purpose. It may be written

$$u_n=u_0+n\Delta u_0+\frac{n(n-1)}{2}\Delta^2 u_0+\frac{n(n-1)(n-2)}{2\,.\,3}\Delta^3 u_0+\&c. \quad . \quad (A)$$

If we employ another symbol δ, defined by

$$\delta f(x)=f(x)-f(x-h),$$

or more generally by

$$(1-\delta)^n f(x)=f(x-nh), \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

we obtain for $f(x-nh)$ or u_{-n} the expression

$$u_{-n}=u_0-n\delta u_0+\frac{n(n-1)}{2}\delta^2 u_0-\frac{n(n-1)(n-2)}{2\,.\,3}\delta^3 u_0+\&c. \quad . \quad (B)$$

In our specimen table, if we take the value 2512 as u_0, then the numbers 650, 169, 43, 12, which slope down from it, will be Δu_0, $\Delta_2 u_0$, $\Delta^3 u_0$, $\Delta^4 u_0$; and the numbers 517, 107, 23, 6, which slope up from it, will be δu_0, $\delta^2 u_0$, $\delta^3 u_0$, $\delta^4 u_0$.

The value assigned to n in (A) and (B) may be either positive or negative, $(1+\Delta)^{-n}$ being equivalent to $(1-\delta)^n$, and $(1-\delta)^{-n}$ to $(1+\Delta)^n$.

To interpolate in our specimen table the value of u for $x=$·42, we may start from $x=$·4 and put $n=\frac{1}{5}$ in (A) or $-\frac{1}{5}$ in (B). The former gives $u_0=2512$, $\Delta u_0=650$, $\Delta^2 u_0=169$, $\Delta^3 u_0=43$, $\Delta^4 u_0=12$, $n=\frac{1}{5}$, $\frac{n(n-1)}{2}=-\frac{2}{25}$, $\frac{n(n-1)(n-2)}{2\,.\,3}=\frac{6}{125}$, $\frac{n(n-1)(n-2)(n-3)}{2\,.\,3\,.\,4}=\frac{-21}{625}$; whence 2630·1 is found as the required interpoland.

To interpolate for $x=$·48 it is better to start from $x=$·5 and put $n=\frac{1}{5}$ in (B) or $-\frac{1}{5}$ in (A).

Rapid convergence is promoted by taking the starting-point as near as possible to the desired interpoland.

Exponents of Δ and δ as Co-ordinates.—The symbol $\Delta\delta u$ or its equivalent $\delta\Delta u$ indicates the number in our table which will be reached, from any selected value of u as starting-point, by taking two steps, one in the direction indicated by Δ and one in the direction indicated by δ. The number thus reached will be the "second difference" standing opposite the selected value of u. In like manner $\Delta^2\delta^2 u$ is the "fourth difference" standing opposite to u. If u is 2512, $\Delta\delta u$ is 133 and $\Delta^2\delta^2 u$ is 10. To reach $\Delta^2\delta u$ from u requires two steps in the direction Δ and one in the direction δ; and to reach $\Delta^2\delta^{-1}u$ requires two steps in the direction Δ and one opposite to the direction δ. When the two exponents (which may be regarded as oblique co-ordinates) are equal in magnitude and opposite in sign, we are carried finally to the same column from which we started. For instance, if u is 2512, the number below it (3162) is $\Delta\delta^{-1}u$, which may be written $\frac{\Delta}{\delta}u$; the number above it (1995) is $\delta\Delta^{-1}u$ or $\frac{\delta}{\Delta}u$. $\left(\frac{\Delta}{\delta}\right)^3 u$ or $\Delta^3\delta^{-3}u$ is the third number (5012) below it; and $\left(\frac{\delta}{\Delta}\right)^3$ is the third number (1259) above it.

Symbolic Law.—The position of $\Delta\delta u$ in the column of second differences, opposite the space between Δu below and δu above, shows that $\Delta\delta u=\Delta u-\delta u$. Accordingly the operation $\Delta\delta$ is equivalent to the operation $\Delta-\delta$, and we are entitled, in all transformations, to employ any substitutions derivable from

$$\Delta-\delta=\Delta\delta \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4)$$

treated as an algebraic equation. We might have deduced it from the fact that u_1, which we have just seen is $\frac{\Delta}{\delta}u_0$, is also $(1+\Delta)u_0$; or that u_0, which is $\frac{\delta}{\Delta}u_1$, is also $(1-\delta)u_1$, or from $u_0=(1-\delta)u_1=(1-\delta)(1+\Delta)u_0$.

Any difference, of whatever order, can be expressed in terms of tabulated values of u by writing $\frac{\Delta}{\delta}-1$ for Δ. For example,

$$\Delta^3 u_0=\left(\frac{\Delta}{\delta}-1\right)^3 u_0=\left\{\left(\frac{\Delta}{\delta}\right)^3-3\frac{\Delta^2}{\delta^2}+3\frac{\Delta}{\delta}-1\right\}u_0=u_3-3u_2+3u_1-u_0.$$

Similarly, $\Delta^4 u_0=u_4-4u_3+6u_2-4u_1+u_0=\Delta^2\delta^2 u_2$. . . . . (5)

Bisection of Intervals.—The value $u_{\frac{1}{2}}$ interpolated midway between u_0 and u_1 is represented by $\left(\frac{\Delta}{\delta}\right)^{\frac{1}{2}}u_0$; and the value $u_{-\frac{1}{2}}$ midway between u_{-1} and u_0 by $\left(\frac{\Delta}{\delta}\right)^{-\frac{1}{2}}$. But we have $\left\{\left(\frac{\Delta}{\delta}\right)^{\frac{1}{2}}+\left(\frac{\delta}{\Delta}\right)^{\frac{1}{2}}\right\}^2$

$$=\left(\frac{\Delta+\delta}{\Delta^{\frac{1}{2}}\delta^{\frac{1}{2}}}\right)^2=\frac{(\Delta-\delta)^2+4\Delta\delta}{\Delta\delta},$$ which by the equivalence of $\Delta-\delta$ to $\Delta\delta$ reduces to $4+\Delta\delta$. Hence $\left(\frac{\Delta}{\delta}\right)^{\frac{1}{2}}+\left(\frac{\delta}{\Delta}\right)^{\frac{1}{2}}=2\left(1+\frac{\Delta\delta}{4}\right)^{\frac{1}{2}}$

$$=2+\frac{\Delta\delta}{4}-\frac{\Delta^2\delta^2}{64}+\frac{\Delta^3\delta^3}{512}-\&c. \quad . \quad . \quad . \quad (C^1)$$

If the operand is u_0 the first member represents $u_{\frac{1}{2}}+u_{-\frac{1}{2}}$.

If the operand is $u_{\frac{1}{2}}$ the first member represents u_1+u_0, and we have $u_0+u_1=2\left(1+\frac{\Delta\delta}{4}\right)^{\frac{1}{2}}u_{\frac{1}{2}}$, whence

$$u_{\frac{1}{2}}=\tfrac{1}{2}\left(1+\frac{\Delta\delta}{4}\right)^{-\frac{1}{2}}(u_0+u_1)$$
$$=\tfrac{1}{2}\left\{1-\frac{\Delta\delta}{8}+\frac{3\Delta^2\delta^2}{128}-\frac{5\Delta^3\delta^3}{1024}+\&c.\right\}(u_0+u_1). \quad . \quad . \quad . \quad (C)$$

This is the best formula for midway interpolation. For $x=\cdot45$ in our table it gives

$$2512+3162=5674\ ;\ -\tfrac{1}{8}(133+169)=-37\cdot75\ ;$$
$$\frac{3}{128}(10+7)=\cdot40\ ;\ \tfrac{1}{2}(5674-37\cdot75+\cdot40)=2818\cdot3.$$

Broader View of Interpolation.—The first difference $(x+h)^r-x^r$ of any positive integral power of x contains no higher power of x than the $(r-1)^{th}$; hence, if successive differences are taken of a positive integral function

$$u=a_0+a_1x+a_2x^2+\ .\ .\ .\ +a_rx^r, \quad . \quad . \quad . \quad . \quad (8)$$

the r^{th} difference will be constant and the $(r+1)^{th}$ will be zero. Conversely, if the r^{th} differences of a function of x have a constant value, the function is expressible as a rational and integral function of x of degree r. Hence all methods of interpolation by means of differences virtually assume that u can be expressed with sufficient accuracy by a series of the form (8) in which r is a small integer. A very direct method of obtaining an interpolation formula from any small number $r+1$ of given values of u (not necessarily equidistant) is to form $r+1$ equations by substituting corresponding values of u and x in (8), and to deduce from them the $r+1$ constants $a_0, a_1, \ldots a_r$; but the calculation is rendered much easier by a transformation of (8).

Let $u_0, u_1, \ldots u_r$ be the given values of u, and $x_0, x_1, \ldots x_r$ the corresponding values of x, which are not necessarily equidifferent, nor in order of magnitude. Assume

$$u=A_0(x-x_1)(x-x_2)\ldots(x-x_r)+A_1(x-x_0)(x-x_2)\ldots(x-x_r)+\&c. \quad (9)$$

the factor $x-x_0$ being omitted in the first term, $(x-x_1)$ in the second, and so on. The number of factors involving x in each term is r, and each term (and therefore also the whole series) is of the form (8). Substituting u_0 and x_0, all the terms will vanish except the first, and we shall have $u_0=A_0(x_0-x_1)(x_0-x_2)\ldots(x_0-x_r)$, which gives A_0. Substituting accordingly for A_0, the first term of (9) becomes $$\frac{(x-x_1)(x-x_2)\ldots(x-x_r)}{(x_0-x_1)(x_0-x_2)\ldots(x_0-x_r)}u_0, \quad . \quad . \quad . \quad . \quad . \quad . \quad (10)$$

and the other terms can be written down by changing suffixes. This process (commonly called Lagrange's) affords great facility for calculating the coefficients. It has the disadvantage, in common with (8), that if we wish to improve upon a first approximation by including a larger number of given values, all the coefficients must be recalculated. This inconvenience is avoided in the following method, employed by Stirling in his *Methodus Differentialis*. Assume

$$u=a_0+a_1(x-x_0)+a_2(x-x_0)(x-x_1)+a_3(x-x_0)(x-x_1)(x-x_2)$$
$$+\ .\ .\ .\ +a_r(x-x_0)(x-x_1)\ldots(x-x_{r-1}) \quad . \quad . \quad . \quad (11)$$

Then we have the equations

$$u_0=a_0\ ;\ u_1=a_0+a_1(x_1-x_0)\ ;$$
$$u_2=a_0+a_1(x_2-x_0)+a_2(x_2-x_0)(x_2-x_1)\ ; \quad . \quad . \quad . \quad (12)$$

and so on.

a_0 is given by the first equation, a_1 by the first two, a_2 by the first three, and so on.

This method is especially useful when the given values of x are equidifferent—an application to which we shall now proceed. We shall call the values of u *ordinates*, the values of x being regarded as *abscissæ*. The given ordinates will be equidistant, their common distance being h, and we shall take n to denote $\frac{x}{h}$, so that n will increase by unity from each ordinate to the next. (11) will be obviously reducible to

$$u=A_0+A_1(n-n_0)+A_2(n-n_0)(n-n_1)+A_3(n-n_0)(n-n_1)(n-n_2)$$
$$+\&c. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (13)$$

where n_0, n_1, n_2, &c., are in random order of magnitude.

When the number of given equidistant ordinates is odd, it is best to take the origin on the middle ordinate; the values of n will then be $0, \pm1, \pm2, \pm3$, &c. Introducing them into (13) in the order $0, 1, -1, 2, -2$, &c., we shall have

$$u=A_0+A_1n+A_2n(n-1)+A_3(n+1)n(n-1)$$
$$+A_4(n+1)n(n-1)(n-2)+\&c. \quad . \quad . \quad . \quad . \quad (14)$$

whence the values of the coefficients can be deduced by the method just indicated. The following method has the advantage of more directly indicating the general expression for any coefficient. We shall operate alternately by Δ and δ, remembering that, since the common increment of n is unity, $\Delta f(n)$ is $f(n+1)-f(n)$, and $\delta f(n)$ is $f(n)-f(n-1)$. We thus obtain from (14)

$$\Delta u\ =A_1+n2A_2+(n+1)n3A_3+(n+1)n(n-1)4A_4+\&c.$$
$$\Delta\delta u\ =2A_2+n2\ .\ 3A_3+n(n-1)3.4A_4+\&c.$$
$$\Delta^2\delta u\ =2.3A_3+n2\ .\ 3\ .\ 4A_4+\&c.$$
$$\Delta^2\delta^2u=2.3.4A_4+n2\ .\ 3\ .\ 4\ .\ 5A_5+\&c.$$

From these and (14), by putting $n=0$,

$A_0=u_0,\ A_1=\Delta u_0,\ 2A_2=\Delta\delta u_0,\ 2\ .\ 3A_3=\Delta^2\delta u_0,\ 2\ .\ 3\ .\ 4A_4=\Delta^2\delta^2u_0$, &c. Hence

$$u=\left\{1+n\Delta+\frac{n(n-1)}{2}\Delta\delta+\frac{n(n^2-1)}{2\ .\ 3}\Delta^2\delta\right.$$
$$\left.+\frac{n(n^2-1)(n-2)}{2\ .\ 3\ .\ 4}\Delta^2\delta^2+\&c.\right\}u_0 \quad . \quad . \quad . \quad . \quad (D)$$

If we had introduced the values of n in the order $0, -1, 1, -2, 2$, &c., and operated first by δ, we should have obtained

$$u=\left\{1+n\delta+\frac{(n+1)n}{2}\Delta\delta+\frac{n(n^2-1)}{2.3}\Delta\delta^2\right.$$
$$\left.+\frac{n(n^2-1)(n+2)}{2\ .\ 3\ .\ 4}\Delta^2\delta^2+\&c.\right\}u_0\ . \quad . \quad . \quad . \quad . \quad (E)$$

Adding these two results and halving, we have Stirling's first formula in central differences,

$$u=\left\{1+n\frac{\Delta+\delta}{2}+\frac{n^2}{2}\Delta\delta+\frac{n(n^2-1)}{2\ .\ 3}\ \frac{\Delta^2\delta+\Delta\delta^2}{2}\right.$$
$$\left.+\frac{n^2(n^2-1)}{2\ .\ 3\ .\ 4}\Delta^2\delta^2+\&c.\right\}u_0 \quad . \quad . \quad . \quad . \quad . \quad (F)$$

The two next terms are

$$\left\{\frac{n(n^2-1)(n^2-4)}{2\ .\ 3\ .\ 4\ .\ 5}\ \frac{\Delta^3\delta^2+\Delta^2\delta^3}{2}+\frac{n^2(n^2-1)(n^2-4)}{2\ .\ 3\ .\ 4\ .\ 5\ .\ 6}\Delta^3\delta^3\right\}u_0.$$

The even differences $\Delta\delta u_0, \Delta^2\delta^2u_0\ldots\Delta^r\delta^ru_0$ are called *central differences* relative to u_0, and the same name is extended to the means $\frac{1}{2}(\Delta u_0+\delta u_0)$, $\frac{1}{2}(\Delta^2\delta u_0+\Delta\delta^2u_0)$, &c., of adjacent odd differences. In the standard arrangement, illustrated by our specimen table, the even central differences of u_0 stand at the same level as u_0, and the odd central differences are the means of the odd differences which stand nearest to this level.

When the number of given equidistant ordinates is even, take the origin at their centre, which will be midway between the two innermost. For these two n will be $\pm\frac{1}{2}$, for the two next beyond them $\pm\frac{3}{2}$, for the next two $\pm\frac{5}{2}$, and so on. Introducing them into (14) in the order $\frac{1}{2}, -\frac{1}{2}, \frac{3}{2}, -\frac{3}{2}$, &c., we have

$$u=A_0+(n-\tfrac{1}{2})A_1+(n+\tfrac{1}{2})(n-\tfrac{1}{2})A_2+(n+\tfrac{1}{2})(n-\tfrac{1}{2})(n-\tfrac{3}{2})A_3+\&c.$$
$$\Delta u=A_1+(n+\tfrac{1}{2})2A_2+(n+\tfrac{1}{2})(n-\tfrac{1}{2})3A_3+\&c.$$
$$\Delta\delta u=2A_2+(n-\tfrac{1}{2})2\ .\ 3A_3+\&c.$$

and by putting n alternately equal to $\frac{1}{2}$ and $-\frac{1}{2}$,

$$A_0=u_{\frac{1}{2}},\ A_1=\Delta u_{-\frac{1}{2}}=\delta u_{\frac{1}{2}},\ 2A_2=\Delta\delta u_{\frac{1}{2}},\ 2\ .\ 3A_3=\Delta^2\delta u_{-\frac{1}{2}}=\Delta\delta^2u_{\frac{1}{2}}$$
$$u=u_{\frac{1}{2}}+(n-\tfrac{1}{2})\delta u_{\frac{1}{2}}+\frac{n^2-\frac{1}{4}}{2}\Delta\delta u_{\frac{1}{2}}+\frac{(n^2-\frac{1}{4})(n-\frac{3}{2})}{2\ .\ 3}\Delta\delta^2u_{\frac{1}{2}}$$
$$+\frac{(n^2-\frac{1}{4})(n^2-\frac{9}{4})}{2\ .\ 3\ .\ 4}\Delta^2\delta^2u_{\frac{1}{2}}+\frac{(n^2-\frac{1}{4})(n^2-\frac{9}{4})(n-\frac{5}{2})}{2\ .\ 3\ .\ 4\ .\ 5}\Delta^2\delta^3u_{\frac{1}{2}}+\&c. \quad (G)$$

If the order of introduction is $-\frac{1}{2}, \frac{1}{2}, -\frac{3}{2}, \frac{3}{2}$, &c., we find

$$u=u_{-\frac{1}{2}}+(n+\tfrac{1}{2})\delta u_{\frac{1}{2}}+\frac{n^2-\frac{1}{4}}{2}\Delta\delta u_{-\frac{1}{2}}+\frac{(n^2-\frac{1}{4})(n+\frac{3}{2})}{2\ .\ 3}\Delta\delta^2u_{\frac{1}{2}}$$
$$+\frac{(n^2-\frac{1}{4})(n^2-\frac{9}{4})}{2\ .\ 3\ .\ 4}\Delta^2\delta^2u_{-\frac{1}{2}}+\frac{(n^2-\frac{1}{4})(n^2-\frac{9}{4})(n+\frac{5}{2})}{2\ .\ 3\ .\ 4\ .\ 5}\Delta^2\delta^3u_{\frac{1}{2}}+\&c. \quad (H)$$

Adding these two results and halving, we have Stirling's second formula in central differences,

$$u=\frac{u_{-\frac{1}{2}}+u_{\frac{1}{2}}}{2}+n\delta u_{\frac{1}{2}}+\frac{n^2-\frac{1}{4}}{2}\ \frac{\Delta\delta(u_{-\frac{1}{2}}+u_{\frac{1}{2}})}{2}+\frac{n(n^2-\frac{1}{4})}{2\ .\ 3}\Delta\delta^2u_{\frac{1}{2}}$$
$$+\frac{(n^2-\frac{1}{4})(n^2-\frac{9}{4})}{2\ .\ 3\ .\ 4}\ \frac{\Delta^2\delta^2(u_{-\frac{1}{2}}+u_{\frac{1}{2}})}{2}+\frac{n(n^2-\frac{1}{4})(n^2-\frac{9}{4})}{2\ .\ 3\ .\ 4\ .\ 5}\Delta^2\delta^3u_{\frac{1}{2}}+\&c. (K)$$

which, when n is 0, reduces to the midway-interpolation formula (C). We may change $u_{-\frac{1}{2}}$ into u_0 and $u_{\frac{1}{2}}$ into u_1 throughout the formula. The differences which enter it are "central" relative to the midway position which we have taken as origin. Each of the odd differences can be expressed indifferently as $\Delta^r\delta^r.\delta u_{\frac{1}{2}}$ or $\Delta^r\delta^r.\Delta u_{-\frac{1}{2}}$.

Reduction to Symmetrical Form.—(K) with u_0 and u_1 in place of $u_{-\frac{1}{2}}$ and $u_{\frac{1}{2}}$ is reducible, by putting $n=p-\frac{1}{2}=\frac{1}{2}-q$, to the form

$$u=pu_1+qu_0-\frac{pq}{6}\{(p+1)\Delta\delta u_1+(q+1)\Delta\delta u_0\}$$
$$+\frac{pq(p+1)(q+1)}{120}\{(p+2)\Delta^2\delta^2u_1+(q+2)\Delta^2\delta^2u_0\}-\&c., \quad . \quad (L)$$

or the more easily remembered form

$$u = pu_1 + \frac{(p+1)p(p-1)}{1.2.3}\Delta\delta u_1 + \frac{(p+2)(p+1)p(p-1)(p-2)}{1.2.3.4.5}\Delta^2\delta^2 u_1$$
$$+ \&c. \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad \text{(M)}$$
$$+ qu_0 + \frac{(q+1q)(q-1)}{1.2.3}\Delta\delta u_0 + \frac{(q+2)(q+1)q(q-1)(q-2)}{1.2.3.4.5}\Delta^2\delta^2 u_0 + \&c.,$$

where p is the distance of the interpoland from u_0, and q its distance from u_1. Each pair of terms in (L) or (M) is equivalent to the term of the same order together with the term of next higher order in (K). The mutual equivalence of (M) and (L) is established without difficulty. The equivalence of either of these to (K) is most easily shown by beginning with (L) and reducing to (K).

Deduction of Differential Coefficients.—Since n is defined as $\frac{x}{h}$, we have $\frac{d}{dn} = h\frac{d}{dx}$. Hence $h\frac{du}{dx} = \frac{du}{dn}$, $h^2\frac{d^2u}{dx^2} = \frac{d^2u}{dn^2}$, &c.

The values of $\frac{du}{dn}$, $\frac{d^2u}{dn^2}$, &c., for any of the tabulated values of u are the coefficients of $n, \frac{n^2}{1.2}$, &c., in Stirling's first formula (F). Thus we find

$$h\frac{du}{dx} = \left(\frac{\Delta+\delta}{2} - \frac{\Delta^2\delta+\Delta\delta^2}{12} + \frac{\Delta^3\delta^2+\Delta^2\delta^3}{60} - \&c.\right)u \quad . \quad \text{(N)}$$
$$h^2\frac{d^2u}{dx^2} = \left(\Delta\delta - \frac{\Delta^2\delta^2}{12} + \frac{\Delta^3\delta^3}{90} - \&c.\right)u \quad . \quad . \quad . \quad . \quad . \quad . \quad \text{(N}^1\text{)}$$

For a value of u midway between two tabulated values u_0 and u_1, we have in like manner from (K)

$$h\frac{du}{dx} = \left(\delta - \frac{\Delta\delta^2}{24} + \frac{3\Delta^2\delta^3}{640} - \&c.\right)u_1 \quad . \quad . \quad . \quad . \quad \text{(P)}$$
$$h^2\frac{d^2u}{dx^2} = \left(\Delta\delta - \frac{5\Delta^2\delta^2}{24} + \frac{259\Delta^3\delta^3}{5760} - \&c.\right)\frac{u_0+u_1}{2} \quad . \quad . \quad \text{(P}^1\text{)}$$

For general values of u, we may differentiate either (F) or (K). From (F) we find

$$h\frac{du}{dx} = \left\{\frac{\Delta+\delta}{2} + n\Delta\delta + \left(\frac{n^2}{2} - \frac{1}{6}\right)\frac{\Delta^2\delta+\Delta\delta^2}{2}\right.$$
$$\left. + \left(\frac{n^3}{6} - \frac{n}{12}\right)\Delta^2\delta^2 + \&c.\right\}u_0 ; \quad . \quad . \quad . \quad . \quad . \quad \text{(Q)}$$
$$h^2\frac{d^2u}{dx^2} = \left\{\Delta\delta + n\frac{\Delta^2\delta+\Delta\delta^2}{2} + \left(\frac{n^2}{2} - \frac{1}{12}\right)\Delta^2\delta^2 + \&c.\right\}u_0 ; \quad . \quad \text{(Q}^1\text{)}$$

n denoting the distance of u from the tabulated value u_0.

The series (A) and (B) give, for tabulated values of u,

$$h\frac{du}{dx} = (\Delta - \tfrac{1}{2}\Delta^2 + \tfrac{1}{3}\Delta^3 - \&c.)u = (\delta + \tfrac{1}{2}\delta^2 + \tfrac{1}{3}\delta^3 + \&c.)u \quad . \quad \text{(R) (S)}$$
$$h^2\frac{d^2u}{dx^2} = (\Delta^2 - \Delta^3 + \tfrac{11}{12}\Delta^4 - \&c.)u = (\delta^2 + \delta^3 + \tfrac{11}{12}\delta^4 + \&c.)u \quad \text{(R}^1\text{) (S}^1\text{)}$$

Limit of Error.—In our specimen table, the values of u are given to the nearest integer; their limit of error is therefore ·5. The sum or difference of any two of them has a limit of error double of this—a fact which we shall express by saying that its *error-ratio* is 2. For a linear function $au_0 \pm bu_1 \pm cu_2$ the error-ratio is $a+b+c$. A first difference $u_1 - u_0$ has an error-ratio 2. For a second difference $u_2 - 2u_1 + u_0$ the error-ratio is 4. For a third difference $u_3 - 3u_2 + 3u_1 - u_0$ it is 8, and in general for a difference of order r it is 2^r. We shall investigate the error-ratio of the determination of $h\frac{du}{dx}$ by the formulæ (N) (P) (R) (S), supposing fifth differences to be negligible.

(N) gives $h\frac{du}{dx} = \left(\frac{\Delta+\delta}{2} - \frac{\Delta^2\delta+\Delta\delta^2}{12}\right)u_0 = \frac{1}{2}(u_1 - u_{-1})$
$- \frac{1}{12}(u_2 - 2u_1 + 2u_{-1} - u_{-2}) = \frac{2}{3}u_1 - \frac{2}{3}u_{-1} - \frac{1}{12}u_2 + \frac{1}{12}u_{-2}$.

Error-ratio $= \frac{2}{3} + \frac{2}{3} + \frac{1}{12} + \frac{1}{12} = 1\frac{1}{2}$.

(P) gives $h\frac{du}{dx} = \left(\delta - \frac{\Delta\delta^2}{24}\right)u_1 = u_1 - u_0 - \frac{1}{24}(u_2 - 3u_1 + 3u_0 - u_{-1})$
$= 1\frac{1}{8}u_1 - 1\frac{1}{8}u_0 - \frac{1}{24}u_2 + \frac{1}{24}u_{-1}$.

Error-ratio $= 1\frac{1}{8} + 1\frac{1}{8} + \frac{1}{24} + \frac{1}{24} = 2\frac{1}{3}$.

(R) gives $(\Delta - \frac{1}{2}\Delta^2 + \frac{1}{3}\Delta^3 - \frac{1}{4}\Delta^4)u_0 = -2\frac{1}{12}u_0 + 4u_1 - 3u_2 + 1\frac{1}{3}u_3 - \frac{1}{4}u_4$.

Error-ratio $= 2\frac{1}{12} + 4 + 3 + 1\frac{1}{3} + \frac{1}{4} = 10\frac{2}{3}$, which is also the error-ratio for (S). Thus the limit of possible error is fully seven times as large with either of these formulæ as with the central-difference formula (N).

The midway-interpolation formula (C) reduces (when sixth differences are negligible) to

$u_{\frac{1}{2}} = \frac{1}{256}\{150(u_0+u_1) - 25(u_{-1}+u_2) + 3(u_{-2}+u_3)\}$ . . . (T), giving as the error-ratio $\frac{2}{256}(150+25+3) = 1\frac{25}{64}$. The formula for the same purpose obtained by putting $n = \frac{1}{2}$ in (A) reduces to $\frac{1}{128}(35u_0 + 140u_1 - 70u_2 + 28u_3 - 5u_4)$, giving $\frac{1}{128}(35+140+70+28+5) = 2\frac{11}{64}$ as the error-ratio.

The actual error in interpolation is usually very far below the theoretical limit. If the six intervals lying between ·2 and ·8 in our specimen table are bisected by means of (C) the errors will be found to be ·2, ·1, ·2, ·3, ·1, ·1; whereas the errors of the seven tabulated numbers between which they lie are ·1, ·3, ·1, ·3, ·1, ·1, ·4; so that the interpolated results are on the whole more exact than the tabulated numbers. This suggests the possibility of increasing the accuracy of a given table by interpolation. For instance, (T) can be employed to recalculate the value of u for $x = ·5$ by means of the tabulated values for ·0, ·2, ·4, ·6, ·8, 1·0. Another mode of procedure is to put the sixth difference equal to zero, thus obtaining

$$u_0 = \tfrac{1}{20}\{15(u_{-1}+u_1) - 6(u_{-2}+u_2) + u_{-3} + u_3\} \quad . \quad . \quad \text{(U)}$$

These two methods agree in giving 3162·4, the true value being 3162·3, and the tabulated value 3162.

Addendum.—Researches made since the foregoing article was written have shown that the two formulæ (F) and (K), known by Stirling's name, are really Newton's, and were first published in his *Methodus Differentialis*, 1711; also that the common formula (A) is Newton's, being given in geometrical form in Lemma 5, Book III., *Principia*. Stirling, in a paper entitled "Methodus Differentialis Newtoniana illustrata," *Phil. Trans.*, 1718, emphasizes the value of these publications; but in his own *Methodus Differentialis*, 1730, where the formulæ are more fully discussed, he does not repeat the reference to Newton. The symmetrical formula (M) was first published at the British Association, 1900 (*Report*, p. 648), and is further illustrated in *Jour. Inst. Actuaries*, January 1901. The combined use of the two operators Δ and δ was described at the British Association, 1899 (*Report*, p. 645), and in *Quar. Jour. Math.*, 1900, 1901. Modern works on practical interpolation are:—*Institute of Actuaries' Text-Book*, Part II., by George King; and *Theory and Practice of Interpolation*, by H. E. Rice, U.S. Naval Observatory, which contains full tables of numerical values of coefficients. A paper entitled "Central Difference Formulæ," by W. F. Sheppard, *Proc. Lond. Math. Soc.*, vol. xxxi., contains the fullest collection we have seen of such formulæ, and a discussion of the limits of error in interpolation. An excellent summary of the early history of interpolation is given in the introduction to the first edition of Hutton's *Mathematical Tables*. (J. D. E.)

Intra, an industrial town, province of Novara, Piedmont, Italy, on the west shore of Lago Maggiore, 9 miles east of Gravellona. It has a station on the Simplon railway, and busy cotton mills, chemical works, hat factories, and dyeworks, and a large institute of arts and sciences. The parish church (1708–51) has a monumental dome (1890) and a belfry (1877), 177 feet high. There are statues to Garibaldi and Victor Emmanuel (1887). Population (1881), 5745; (1898), 5700.

Invercargill, capital town of Southland county, South Island, New Zealand, 100 miles west-south-west of Dunedin. It is the centre of the large grazing and farming district of Southland. Amongst its chief buildings are the government offices, excellent public reading-rooms, and a number of factories. Most of its trade passes through Bluff Harbour, some miles away, which is connected with the town by rail. The exports of the two places were in 1900, £741,750; their imports in 1900, £288,170. Bluff Harbour is the port of call and departure for steamers for Melbourne and Hobart. Population, including suburbs, 10,630.

Inverness, a royal and parliamentary burgh (Inverness group) and the county town of Inverness-shire, Scotland, near the mouth of the river Ness, 165 miles north-north-west of Edinburgh by the Forth Bridge route. Recent erections include four churches, a town hall, a theatre, new public market (to replace one burned down in 1889), Highland orphanage, new academy, and new post office. The cemetery of Tomnahurich is one of the most beautifully situated burying-grounds in the United Kingdom. Inverness—"the capital of the Highlands," as it is called—is the centre of traffic in connexion with the shooting season, and is thronged with tourists every summer. The Northern Meeting and County Ball at the end of September usually indicate the close of the midsummer vacation. Inverness is the port for the passenger traffic on the Caledonian Canal, the pier being a mile or so distant from the town. The finely wooded islands in the

river are a popular resort. It is commonly said that the inhabitants speak the best English in the British Isles. The extension of the harbour was undertaken at a cost of £50,000. There were 42 vessels of 3272 tons registered at the port in 1898. In 1888, 3139 vessels of 362,953 tons entered; in 1898, 3775 vessels of 484,574 tons. Imports were valued at £58,991 in 1888, and £97,065 in 1898. Coal and wood are the chief imports. Tweed (tartan) manufacture is the leading industry. Inverness is a great distributing centre of trade to the Highlands. The academy is an endowed secondary school. Valuation, 1889–90, £90,280; 1899–1900, £118,845. Population (1881), 17,385; (1901), 21,193.

Inverness-shire, a maritime Highland county of North Scotland, bounded on the N. by Ross-shire, on the N.E. by Nairn and Elgin, on the E. by Banffshire and Aberdeenshire, on the S.E. by Perthshire, on the S. by Argyllshire, and on the W. by the Atlantic.

Area and Population.—In 1891 the Argyll portion of Small Isles was placed in Inverness, as were the Nairn parts of Daviot and Dunlichty and Petty; Cawdor was placed wholly in Nairn; the parish of Urray with a portion of Kilmorack added was restricted to Ross; and the boundary was also altered between Inverness and Elgin, in the parish of Cromdale, which became an Elgin parish, its Inverness portion being added to another Inverness parish. The area of the county (foreshore excluded) is 2,784,884 acres, or 4351·5 square miles. The population was in 1881, 90,454; in 1891, 89,317; in 1891, on the above area, 90,121, of whom 43,585 were males and 46,536 females; in 1901, 90,182, of whom 43,810 were males and 46,372 females. On the old area, taking land only (2,616,545 acres or 4088·3 square miles), the number of persons to the square mile in 1891 was 22, and the number of acres to the person 29·3. In the registration county, which had a population of 85,535 in 1891, the population decreased between 1881 and 1891 by 1·37 per cent. Between 1881 and 1891 the excess of births over deaths was 7700, and the decrease of the resident population 1193. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	1422	366	2313	8·5
1890	1424	346	2033	7·43
1899	1479	420	2004	8·4

The birth-rate, death-rate, and marriage-rate are all below the rates for Scotland. The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881–90.	1890.	1891–98.	1899.
Birth-rate . .	26·83	25·41	23·83	24·06	23·78
Death-rate . .	16·49	16·44	16·69	17·64	17·55
Marriage-rate .	4·24	4·51	4·05	5·05	4·98

The number of Gaelic-speaking persons in the county in 1891 was 44,814, of whom 17,316 spoke Gaelic only; and there were 86 foreigners. Valuation in 1889–90, £316,411; 1899–1900, £366,237.

Administration.—The county returns a member to Parliament. Inverness (21,193) is the only royal burgh, and one of the Inverness group of parliamentary burghs. There are 33 civil parishes, with poorhouses at Inverness and in Skye and the Long Island. The number of paupers and dependants in September 1899 was 3372. Inverness forms a sheriffdom with Elgin and Nairn, and there are resident sheriffs-substitute at Inverness, Fort-William, Portree in Skye, and Lochmaddy in North Uist.

Education.—Thirty-seven school boards manage 168 schools, which had an average attendance of 12,289 in 1898–99, while 14 voluntary schools (8 Roman Catholic, 3 Episcopal) had 684. There are 2 secondary schools in Inverness, and 24 other schools in the county earned grants in 1898 for giving higher education. The county council hands over the "residue" grant to the county committee on secondary education, which allocates it among district committees for expenditure on local technical classes; Inverness town council subsidizes the burgh technical and art school.

Agriculture.—In 1898 the percentage of land under crops was only 5·38, being higher than that in Sutherland alone, but since 1852 the cultivated area has increased more than 300 per cent. An immense majority of the holdings are crofts, the average size of the 6951 holdings in 1895 being 22 acres; 2780 or 39·99 were under 5 acres, 3590 or 51·65 were between 5 and 50 acres, and only 8·36 were above 50 acres. The number between 50 and 100 acres was 295; between 100 and 300, 249; between 300 and 500, 26; between 500 and 1000, 6; and there were 5 over 1000. Oats are the predominant crop, and are about stationary in acreage; and the same may be said of barley since it reached its maximum in the 'eighties. The wheat acreage is trifling. The following table gives the principal acreages, as far as possible, at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	126,306	39,584	19,513	27,155	39,140	914
1885	149,521	36,966	19,493	29,976	58,924	1432
1890	150,529	39,777	18,645	32,256	58,995	830
1895	150,725	37,883	17,344	29,927	65,132	388
1899	148,766	38,333	16,827	31,365	61,740	464

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	8938	51,287	20,208	711,910	2897
1885	8692	51,279	21,035	684,246	3488
1890	8744	48,602	21,046	675,148	3809
1895	8872	51,799	21,261	645,900	3019
1899	8952	52,321	22,362	628,695	2669

From the commencement of the operations of the Crofters' Commission in 1886 to the end of 1898, 5269 applications to fix fair rent were dealt with in the county, and rents amounting to £21,036 were reduced to £15,336, while of £69,944 of arrears £49,365 was cancelled; 890 applications for enlargement of holdings were dealt with, and 8354 acres were added to existing holdings. In 1895, 150,929 acres were under wood, of which 5944 had been planted since 1881. At the census of 1891 there were 11,958 men and 1835 women in the county engaged in agriculture. Deer forests covered 713,491 acres in 1899, an increase of 149,451 acres since 1883, and their annual value was £47,440.

Industries and Trade.—The ports and creeks of Inverness-shire are distributed among five fishery districts—Findhorn, Stornoway, Barra, Lochcarron and Skye, and Fort-William—and number 65, having in 1898, 1091 boats of 3058 tons, with 3077 resident fishermen and boys, and a catch valued at £27,001. Barra is an exclusively Inverness district, and comparative statistics may best be given for it and Lochcarron and Skye together:—

Year.	Boats.			Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.	Value.			
1890	962	3198	£7,615	£26,223	2915	£20,940
1898	962	3544	£10,618	£18,469	2511	£28,144
1899	940	3444	£10,451	£18,219	2482	£108,650

Of the total value of fish caught in 1899, £90,617 was the value of the herring catch and £11,863 the value of shell-fish. In 1899 there were 3987 persons employed in the two districts in connexion with the various branches of the fishing industry. A number of new railways were built during the last twenty-five years of the 19th century, including the West Highland (Glasgow to Banavie), opened in 1894–95, and the Aviemore–Inverness direct line, opened in 1898. These two added 70 miles to the railway mileage; and there are also the Mallaig extension of the West Highland and the Invergarry and Fort-Augustus line (1900).

(W. Wa.)

Inverurie, a royal and parliamentary burgh (Elgin group) of Aberdeenshire, Scotland, at the confluence of the rivers Don and Ury, 16¼ miles north-west of Aberdeen by rail. Paper and mineral waters are the only manufactures, but the town is an important centre of the cattle trade for the London market. The workshops of the Great North of Scotland Railway Company are here, and a new station was opened in 1900. There is a town hall. Population (1881), 3048; (1901), 3454.

Ionia, a city and the capital of Ionia county, Michigan, U.S.A., on Grand river, and on the Detroit, Grand Rapids, and Western, and the Grand Trunk Railways, at an altitude of 650 feet. It is in a farming and lumber region, and contains the state asylum for insane criminals and the house of correction. Population (1880), 4190; (1890), 4482; (1900), 5209, of whom 864 were foreign-born.

Ionian Islands. See Greece.

Iowa, one of the states of the American Union, situated on the western bank of the Mississippi river, the sixteenth admitted, and the tenth in population according to the censuses of 1880, 1890, and 1900. The area is 56,025 square miles, of which 550 miles is water surface. It is the twenty-second of the states in size. The population in 1900 was 2,231,853, giving 39·84 to the square mile, a gain of 319,957, or 16·74 per cent., since the census of 1890. Of the total, 1,156,849 (51·8 per cent.) were males and 1,075,004 (48·2 per cent.) females; 1,925,933 were native-born and 305,920 (13·7 per cent.) foreign-born; 2,218,667 were white and 13,186 (0·6 per cent.) coloured, of whom 12,693 were negroes, 104 Chinese, 7 Japanese, and 382 Indians. The urban population in 1900, classing as such all persons residing in cities of 8000 inhabitants or more, was 374,725, or 16·8 per cent. of the total population, as against 14·1 per cent. in 1900. The death-rate in 1900 was about 8·7 per cent.

The city of Des Moines is situated near the centre of the coal-bearing area. The annual output of coal ranges in value from $5,000,000 to $6,000,000. The coal mines gave employment in 1899 to 10,736 persons, of whom 7829 were miners. Clays suitable for a great variety of uses are found in the state. Extensive beds of gypsum occurring near Fort Dodge are probably of Cretaceous age. The manufacture of stucco from Fort Dodge gypsum has become an important industry, the annual value of the product approximating a quarter of a million dollars. The Pleistocene deposits include five successive drift-sheets, which give a great variety of remarkably productive soils. The loess is a peculiar silt-like deposit, a secondary product of the drift, covering more than half the area, and possessing characteristics which make it for many purposes one of the most desirable of soils. Rich alluvial deposits occurring in the wider stream valleys are also secondary products of the drift. Lead is found to some extent in the vicinity of Dubuque. The first enterprise ever set on foot in any part of what is now Iowa was that of mining lead, which was begun over a hundred years ago by Julien Dubuque.

Education.—Liberal provision is made for common schools. In 1900 there were 12,615 ungraded schools and 5766 rooms in graded schools. The number enrolled in the schools during the previous school year was 566,223, and the average attendance 373,474. The number of instructors was 28,789, of whom 23,840 were women. The expenditure during that year on account of teachers was $5,606,932, and for all other purposes $3,421,986. There were 13,861 school-houses valued at $17,655,992, with over $700,000 worth of apparatus and more than 300,000 volumes in district libraries. The permanent school fund amounts to $4,746,632. The amount of interest apportioned to the counties during 1900 was $237,400. The number of illiterates over ten years of age in 1895 was 11,102, or about 0·54 per cent. of the entire population. The clear proceeds of all fines collected, and the proceeds of a county tax of not less than $1 or more than $3 on the $1000 of the taxable value of property, together with the apportionment of the income of the permanent school fund, constitute what is known as the temporary school fund, which is distributed twice a year among the school districts according to the number of youths therein between five and twenty-one years of age, and is used altogether for the payment of teachers. In 1900 the number of persons of school age (five to twenty years inclusive) was 767,870. Out of 635,298 males of voting age, 17,061 were illiterate (unable to write), of whom 8273 were foreign-born and only 975 were negroes. The state university is at Iowa City, the former capital. It has a collegiate department with a faculty of forty-eight professors; a law department with six; a medical department with twenty-three; a homœopathic medical department with thirteen; a dental department with three; and a pharmacy department with nine. The number of students in attendance in 1900 was 1438. It has an annual income from the state treasury amounting to $125,500, besides interest on trust funds and other sources of revenue. The university is governed by a board of regents, consisting of the governor of the state, the superintendent of public instruction, and eleven other members chosen by the general assembly for six years. The Iowa state college of agriculture and mechanic arts at Ames has a tract of land comprising 840 acres, on which are forty-three farm and college buildings besides the equipment of the several departments, the whole being valued at $755,327. The endowment fund amounts to $683,000, mainly derived from the proceeds of the sale of 240,000 acres of land granted the state in 1862 by the Federal Government. The college is governed by a board of trustees constituted similarly to the board of regents. The Iowa state normal school is at Cedar Falls, Blackhawk county. It had in 1900 forty instructors and 1610 students. It draws from the state treasury annually for support and contingent expenses $59,000. There are also a number of denominational and undenominational colleges.

Charities, &c.—There are several institutions of an eleemosynary and penal character. The Iowa soldiers' home at Marshalltown, with a membership of 646; the orphans' home and home for destitute children at Davenport, with 436 inmates; the college for the blind at Vinton, with an attendance of 131; the school for the deaf at Council Bluffs, with 251 pupils; the institution for feeble-minded children at Glenwood, with 879 under its care. There are three hospitals for the insane, situated at Mount Pleasant, Independence, and Clarinda, with 2905 patients. The penitentiaries are at Fort Madison and Anamosa, and have 943 prisoners. There is an industrial school at Eldora for boys, and one at Mitchellville for girls. They have 630 inmates. The property connected with all these institutions comprises 4190 acres of ground. They are all under the direction of a board of control, consisting of three persons appointed by the governor and Senate for a term of six years.

Religion.—The number of church organizations at the last state census was 4862, with 571,264 church members, owning 4498 church edifices, with a seating capacity of 1,303,804, and valued at $15,105,085. The leading denominations, in the order of the number of church edifices, are: the Methodist, with 1382; the Presbyterian, with 454; the Lutheran, with 424; the Catholic, with 411; the Baptist, with 398; the "Disciples of Christ" and "Christian Connection" (not distinguished, but mostly of the former), with 325; Congregational, with 251; United Brethren, with 156; Friends, with 82; Reformed, with 66; Protestant-Episcopal, with 65; Adventist, with 56.

Agriculture.—Of its 35,000,000 acres of land there is very little which is not susceptible of cultivation. Indian corn is the principal staple. The agricultural products for 1900 were as follows:—

Crop.	Amount.	Per Acre.
	Bushels.	
Corn	353,365,000	40·3
Fall wheat	1,018,070	13·3
Spring wheat	20,280,280	14·3
Oats	138,832,330	34·7
Rye	1,621,630	15·6
Barley	12,695,200	25·3
Buckwheat	180,000	16·0
Flaxseed	1,222,980	11·7
Potatoes	10,850,900	72·0
	Tons.	
Hay, cultivated	3,609,010	1·4
Hay, wild	1,530,050	1·1

Other products of the soil were valued as follows:—Timothy seed, $825,000; clover seed, $350,000; sorghum, $275,000; broom corn, $35,000; corn fodder, $9,500,000; pasturage, $30,000,000; straw and other forage, $4,000,000; fruits and vegetables, $8,500,000; sweet potatoes, $275,000.

The whole aggregated $229,805,058 in value. The cereals amounted in volume to an average of more than five tons for each inhabitant. The increment gained by converting soil products into beef, pork, mutton, dairy and poultry products, horses, &c., added materially to the foregoing value.

The number and value of live stock in 1900 were as follows :—

Stock.	Number.	Value
		Dollars.
Horses	979,389	48,810,774
Mules	31,232	1,708,906
Milch cows	1,263,283	44,088,577
Other cattle	2,178,129	72,930,788
Sheep	419,218	1,333,113
Goats	10,869	31,163
Swine	3,534,833	18,466,739
Total	8,416,953	187,370,060

The total number of creameries was 779, and there were 188 "skim stations," their total value being $2,320,727. Estimating for some creameries not reported, the aggregate product in 1899 was 87,972,470 ℔, of which 77,013,875 ℔ were shipped. There were 69 cheese factories, with an estimated value of $105,915, with a total annual production, in 1899, of 3,669,109 ℔. For the production of cheese, butter, and condensed milk at factories, see the following paragraph.

Manufactures.—The statistics of manufactures in 1890 and 1900, with the percentage of increase during the decade, are shown by the following table :—

	1890.	1900.	Per cent. of Increase.
Number of manufacturing establishments	7,440	14,819	99·2
Capital	$77,513,097	$102,733,103	32·5
Salaried officials, clerks, &c.	8,137[1]	5,664[2]	30·4[3]
Salaries	$5,449,377[1]	$4,486,117	17·7[3]
Wage-earners, average number	51,037	58,553	14·7
Total wages	$20,429,620	$23,931,680	17·1
Miscellaneous expenses	$5,732,206	$7,988,767	39·4
Cost of materials used	$79,292,407	$101,170,357	27·6
Value of products, including custom work and repairing	$125,049,183	$164,617,877	31·6

Four of the most important manufacturing industries in the state in 1900, with the value of their products, were: Slaughtering and meat packing (wholesale), $25,296,518 ; cheese, butter, and condensed milk (factory product), $15,846,077 ; flouring and grist mill products, $13,823,083 ; lumber and timber products, $8,677,058.

Railways.—In the early history of Iowa much of the transportation was by boats on the Mississippi, Missouri, and Des Moines, and occasionally the Cedar, Iowa, and other rivers. Now the interior rivers are entirely abandoned as commercial highways, and the Missouri river nearly so, while the traffic on the Mississippi is greatly diminished in volume. Railways have come in to supply the vastly greater facilities which are now needed for moving the products and crops. The first railway in any part of Iowa was constructed in Davenport and Scott county in 1854, but there was no locomotive in the state until the next year. There are now 9400 miles of railway, valued at $185,000,000. The most extensive is that of the Chicago, Milwaukee, and St Paul Railway system, which has 1775 miles. The next is the Chicago and North-western Railway system, with 1418 miles, followed by the Chicago, Burlington, and Quincy Railway system, with 1333 miles ; the Chicago, Rock Island, and Pacific Railway system, with 1200 ; the Burlington, Cedar Rapids, and Northern Railway system, with 967 ; and the Dubuque and Sioux City Railway, which is a part of the Illinois Central Railway system, with 836 miles.

Finances.—Property is assessed at presumably its full value, and local, county, and state boards of review are required to consider the assessment thus made, and bring it to what in their judgment is its true value. When the latter is thus ascertained, one-fourth of it is taken for the taxable value of the property. Upon this basis the average rate of taxation for all purposes is about three and one-third per cent., or eight and one-half mills on the dollar of the ascertained value of all property. This value in 1900, on one-fourth of which the taxes would be collected in the following year, was $2,158,693,096, or $967 for each person in the population. The levy for state purposes to be collected during 1901 was $2.60 on the $1000 of taxable valuation, besides 20 cents on each $1000 for improvements at the university and at the college of agriculture. In addition to the direct tax on property the state derives considerable revenue from other sources. The receipts into the treasury for the fiscal year ending 30th June 1900 amounted to $2,592,496, and the disbursements to $2,056,027 ; and there was a balance in the treasury over and above all outstanding obligations of $946,001. The state is entirely out of debt, excepting the amount of $10,936, which it owes to its own school fund, and on which it pays 6 per cent. interest.

Banks.—On the 5th day of September 1900 there were 196 national banks, having capital approximately of $14,500,000, and individual deposits aggregating $49,440,759. At the same time there were 216 incorporated state banks other than savings banks, having capital of $9,474,800, and deposits amounting to $33,921,531. There were also 232 "savings banks," a large proportion of which, however, did a commercial banking business. Their capital amounted to $8,835,100, and their deposits to $60,751,672, making the aggregate of deposits in incorporated banks $144,113,962. There are no official statistics of private banks, but the number is not far from 400. The total number of banks and banking-houses is greater than in any other state in the Union. There are also something like 20 loan and trust companies, statistics of which are not collected. Their capital varies from $50,000 to $500,000. On the 31st of December 1900 there were 87 building and loan associations in the state, with assets amounting to $8,208,405.

Government.—The General Assembly, as the legislative body is called, is composed of a Senate of fifty members, elected for four years from as many districts, and a House of Representatives, consisting of 100, elected for two years from 84 counties and 6 districts (each composed of two or three counties). The state officers are governor, lieutenant-governor, secretary of state, auditor of state, treasurer of state, attorney-general, and superintendent of public instruction, each elected by the people for a term of two years, and three railway commissioners, chosen for three years. The governor has a qualified veto on all legislative acts. The governor, secretary, auditor, and treasurer constitute the executive council, which body is clothed with quite extensive powers, among them being that of assessing the property of railway, express, telegraph, and telephone corporations. The supreme court consists of six judges chosen by the popular vote for six years. The clerk of this court and the reporter of its decisions are each elected by the people for four years. There are fifty-three district judges, in twenty districts, elected for four years. All incorporated places having a population of 2000 or over are known as cities ; all other incorporated places are designated as towns. A platted town-tract, which is not incorporated, is called a village. The principal cities, with their population, are: Des Moines, the capital, 62,139 ; Dubuque, 36,297 ; Davenport, 35,254 ; Sioux City, 33,111 ; Council Bluffs, 25,802 ; Cedar Rapids, 25,656 ; Burlington, 23,201 ; Clinton, 22,698 ; Ottumwa, 18,197 ; Keokuk, 14,641 ; Muscatine, 14,073. All cities and towns may establish waterworks, or gas or other lighting works, or they may give franchises to private individuals therefor, or for street railways, but the establishment of such on the part of the city, or the granting of franchises, must first be approved by a vote of the people. Cities and towns are limited in their current expenses to an amount not exceeding 1 per cent. of the taxable value of property. Additional amounts may be levied for waterworks or improvements, and also to pay the principal and interest of public debt. All counties, cities, towns, and school districts are restricted as to public indebtedness to 5 per cent. of the taxable value of the property within their limits respectively.

History.—Politically the Democratic party controlled the state during most of its first decade, and until the slavery question became the overshadowing one. Since the organization of the Republican party in 1856, that party has had a majority of the legislature, and with the exception of a period of four years the governors have been of that party, while the electoral vote of the state has uniformly from 1852 to 1900 been cast for the same party's candidates for President and Vice-President. At the election of 1900 President McKinley (Republican) received 307,808 votes ; Bryan (Democrat), 209,265 ; Wooley (Prohibitionist), 9502 ; four other candidates, 3780 ; McKinley's plurality was 98,543, his majority 85,261. The state raised four regiments of infantry and two batteries of artillery at the time of the Spanish war (1898), but the early close of hostilities prevented more than one regiment from seeing active service. (L. M. S.)

[1] Includes proprietors and firm members, with their salaries; in 1900 their salaries were not reported, but their number was 16,619.

[2] Greatest number reported employed at any one time during the year.

[3] Decrease.

Iowa City, capital of Johnson county, Iowa, U.S.A., on the Iowa, at an altitude of 654 feet. It has an undulating site and a regular plan. It is served by the Chicago, Rock Island, and Pacific, and the Burlington, Cedar Rapids, and Northern Railways. It is the seat of the state university, a non-sectarian, co-educational institution, opened in 1855. The university has collegiate, professional, and graduate departments, the professional departments including law, medical, homœopathic, dental, and pharmaceutical schools. In 1899 the professors and other instructors numbered 100, and the attendance of students was 1339, of whom one-fifth were women. Its property was valued at $982,000, and its total income from all sources was $151,300. Population (1880), 7123; (1890), 7016; (1900), 7987, of whom 1355 were foreign-born.

Ipswich, a municipal, county, and parliamentary borough of England, capital of Suffolk county, on the estuary of the Orwell, 69 miles by rail north-east of London. Several of the churches have been wholly or partly restored since 1880—St Mary at the Elms, St Matthew's, St Peter's, St Stephen's, Holy Trinity, and the Presbyterian church. All Saints' was built in 1892, the new St John the Baptist's in 1898–99, and St Bartholomew's in 1900–1. A new cemetery was laid out in 1893–96. In 1887 the library was enlarged, and in 1892 the science and art schools. The Eastern Counties Dairy Institute, which was established at Akenham in 1888, was transferred to Gipperswyk Park at Ipswich in 1895. The Lyceum Theatre was built in 1890–91. New corporation baths were opened in 1894. The public institutions embrace a public library of nearly 20,000 volumes, and a small medical library, the East Suffolk hospital and dispensary, the fever hospital, the borough lunatic asylum, the nurses' home for the sick poor, and the borough of Ipswich science, art, and technical schools. These last have a picture gallery and college in Christchurch mansion. There are also the middle school for boys, a high school for girls and an endowed school for girls, and a scientific society. The corporation consists of a mayor, 10 aldermen, and 30 councillors. In 1880–81 Ipswich was provided with a system of sewage with outfall works $1\frac{1}{2}$ miles below the town; and in 1892 a new reservoir in connexion with the waterworks was purchased by the corporation. The spring assizes are held here; the summer assizes at Bury St Edmunds. Amongst the industries may be mentioned engineering, the manufacture of railway plant, of boots and shoes, clothing, corsets, bricks, and tobacco, and malting. The navigation of the port was facilitated by the completion of a new lock entrance in 1881. In 1895 the imports amounted to £247,349 in value, and the exports to £31,155; in 1900 to £541,014 and £27,933 respectively. The latter consist chiefly of agricultural machines, railway plant, artificial manures, oils and oil-cake, bricks, grain and flour, and roots. In 1900 the port was entered by 213 vessels of 69,006 tons engaged in foreign trade. There is also a coasting trade of 600,000 tons annually, entered and cleared together. At the same date 124 vessels of 7647 tons were registered as belonging to this port, and 49 fishing boats of 350 tons. The parliamentary borough returns two members to the House of Commons. Population (1891), 57,433; (1901), 66,622. Birth-rate, 29·5 (1898); death-rate, 16·6 (1898).

See N. Bacon, *Annalls of Ipswche*. Ipswich, 1884.

Ipswich, a town in the county of Stanley, Queensland, Australia, on the river Bremer, $23\frac{1}{2}$ miles west of Brisbane. The river is here crossed by two bridges, the newer built to carry the railway. The district is a mining, manufacturing, and agricultural one; coal is worked with little labour, being near the surface. Population (1891), 7625; (1901), 8637.

Iquique, or Puerto de Iquique, a town and port in Chile, capital of the province and department of the same name, in 20° 12′ 15″ S. and 70° 11′ 15″ W. The population in 1895 was 33,031. It has railway communication with Pisagua, and is 820 miles north of Valparaiso. It was occupied by the Chilian forces in 1879 during the war with Peru, and finally ceded to the former country by the treaty of 20th October 1883. Iquique exists under the most artificial conditions, being entirely dependent on outside sources for all its supplies of food, water, and fuel. Practically the whole population is engaged in the manufacture of iodine and nitrate of soda, Iquique being the centre of trade. Nevertheless it disputes with Valparaiso the position of having the largest foreign trade of any seaport in the country. In 1899 Valparaiso led, having £6,327,427, as compared with £6,155,300 for Iquique; whereas in 1900 Iquique came first with £7,194,570, as compared with £6,892,660 for Valparaiso. In the latter year no less than 33 per cent. of the total foreign trade of Chile entered and cleared at Iquique. (See Chile.)

Irák, a province of Persia, situated west of Kum and Kashán and east of Burújird, and paying a yearly revenue of about £15,000. Its capital is Sultánábád, situated in 34° 6′ N. and 48° 25′ E., at an elevation of 5880 feet, and 77 miles from Kum. It was founded in the beginning of the 19th century, and is still occasionally spoken of as Shahr-i-No, the "new city." Its population is about 8000. The province produces much grain, and supplies neighbouring districts, particularly those situated eastwards, but its greatest income is derived from the carpets which are made in many of its villages and mostly exported to Europe, and the value of which is estimated at about £100,000 per annum. Two British firms are established at Sultánábád solely for this trade.

Irawadi, or Irrawaddy, the principal river in the province of Burma, traversing the centre of the country, and probably running throughout its entire course in British territory. It is formed by the confluence of the Mali and N'mai rivers (usually called Mali-kha and N'mai-kha, the *kha* being the Kachin word for river) in 25° 45′ N. The N'mai is the eastern branch. The definite position of its source is still uncertain, and it seems to be made up of a number of considerable streams, all rising within a short distance of each other in about 28° 30′ N. It is shown on some maps as the Lu river of Tibet, but it is now quite certain that the Tibetan Lu river is the Salween, and that the N'mai has its source or sources near the southern boundary of Tibet, to the north-east or east of the source of the Mali. At the confluence the N'mai is larger than the Mali. The general width of its channel seems to be 350 or 400 yards during this part of its course. In the rains this channel is filled up, but in the cold weather the average breadth is from 150 to 200 yards. The N'mai is practically unnavigable. The Mali is the western branch. Like the main river, it is called Nam Kiu by the Shans. It rises in the hills to the north of the Hkam Ti country, probably in about 28° 30′ N. Between Hkam Ti and the country comparatively close to the confluence little or nothing is known of it, but it seems to run in a narrow channel through continuous hills. The highest point on the Mali reached from the south by Major Hobday in 1891 was Ting Sa, a village a little off the river, in 26° 15′ N. About a mile above the confluence it is 150 yards wide in January and 17 feet deep, with a current of $3\frac{3}{4}$ miles an

hour. Steam launches can only ascend from Myit Kyina to the confluence in the height of the rains. Native boats ascend to Laikaw or Sawan, 26° 2′ N., all the year round, but can get no farther at any season. From the confluence the river flows in a southerly direction as far as Bhamo, then turns west as far as the confluence of the Kaukkwe stream, a little above Katha, where it again turns in a southerly direction, and maintains this in its general course through Upper and Lower Burma, though it is somewhat tortuous immediately below Mandalay. Just below the confluence of the Mali and N'mai rivers the Irawadi is from 420 to 450 yards wide and about 30 feet deep in January at its deepest point. Here it flows between hills, and after passing the Manse and Mawkan rapids, reaches plain country and expands to nearly 500 yards at Sakap. At Myit Kyina it is split into two channels by Naungtalaw island, the western channel being 600 yards wide and the eastern 200. The latter is quite dry in the hot weather. At Kat-kyo, five or six miles below Myit Kyina, the width is 1000 yards, and below this it varies from 600 yards to three-quarters of a mile at different points. Three miles below Sinbo the Third Defile is entered by a channel not more than 50 yards wide, and below this, throughout the defile, it is never wider than 250 yards, and averages about 100. At the "Gates of the Irawadi" at Poshaw two prism-shaped rocks narrow the river to 50 yards, and the water banks up in the middle with a whirlpool on each side of the raised pathway. All navigation ceases here in the floods. The defile ends at Hpatin, and below this the river widens out to a wet-weather channel of 2 miles, and a breadth in dry weather of about 1 mile. At Sinkan, below Bhamo, the Second Defile begins. It is not so narrow nor is the current so strong as in the Third Defile. The narrowest place is more than 100 yards wide. The hills are higher, but the defile is much shorter. At Shwegu the river leaves the hills and becomes a broad stream, flowing through a wide plain. The First Defile is tame compared with the others. The river merely flows between low hills or high wooded banks. From Mandalay up to Bhamo the river is navigable a distance of nearly a thousand miles for large steamers all the year round, but small launches and steamers with weak engines are often unable to get up the Second Defile in the months of July, August, and September, owing to the strong current. The Irawadi Flotilla Company's steamers go up and down twice a week all through the rains, and the mails are carried to Bhamo on intermediate days by a ferry-boat from the railway terminus at Katha. During the dry season the larger boats are always liable to run on sandbanks, more especially in November and December, when new channels are forming after the river has been in flood. From Bhamo up to Sinbo no steamers can ply during the rains, that is to say, usually from June to November. From November to June small steamers can pass through the Third Defile from Bhamo to Sinbo. Between Sinbo and Myit Kyina small launches can run all the year round. Above Myit Kyina small steamers can reach the confluence at the height of the flood with some difficulty, but when the water is lower they cannot pass the Mawkan rapid, just above Mawme, and the navigation of the river above Myit Kyina is always difficult. The journey from Bhamo to Sinbo can be made during the rains in native boats, but it is always difficult, and sometimes dangerous. It is never done in less than five days, and often takes twelve or more.

For the Irawadi in its lower course see the earlier volume of the *Encyclopædia Britannica*, ninth edition. (J. G. Sc.)

Irbit, a district town of Russia, government of Perm, 110 miles north-east of Ekaterinburg, on the Nitsa, 72 miles from Kamyshloff railway station. It is famous for a great fair, which lasts for two months, and at which all sorts of European and Asiatic goods are offered, the yearly returns of articles sold representing a value of over £4,000,000:—Cottons, £1,850,000; woollens, £254,000; flax and hemp, £261,000; silks, leather, as well as all sorts of metals, metallic and other manufactured goods from Russia, furs, £260,000; hides, felt, raw wool, representing an aggregate value of £522,000, from Siberia and the Kirghiz Steppe; while tea (£495,000) and various other goods (£52,000) are brought from China and Turkestan. These are average figures, but there have been years when goods to the value of nearly £6,000,000 have been brought to the fair. The Irbit ironworks are 41 miles to the south-west. Population, 20,064.

IRELAND.

Geography and Statistics.

IRELAND, an island to the west of Great Britain, together with it forming the United Kingdom, extends from 51° 26′ to 55° 21′ N. and from 5° 25′ to 10° 30′ W. It is bounded on the north, south, and west by the Atlantic Ocean, and on the east is separated from Great Britain by the North Channel, the Irish Sea, and St George's Channel. Its greatest length is 302 miles, and its greatest breadth 174 miles.

Area and Population.—The total area comprises 20,825,596 acres, which includes 492,252 acres under the larger rivers, lakes, and tideways, and 129,681 acres under the smaller rivers and lakes. Territorially the island is divided into 4 provinces and 32 counties, Leinster having 12 counties, Munster 6, Ulster 9, and Connaught 5. Excluding the extent of land under the larger rivers, lakes, and tideways, the table on the following page shows the area in square miles by provinces and counties, the population in 1881, 1891, and 1901, and the average number of persons to a square mile in 1901. The 1901 populations are of the administrative counties under the Local Government (Ireland) Act, 1898.

Of the total population in 1891, 2,318,953 were males and 2,385,797 females. It will be seen that between 1881 and 1891 the total population decreased by 470,086 or 9·08 per cent., the population of Leinster by 87,207 or 6·8 per cent., of Munster by 157,472 or 11·8 per cent., of Ulster by 123,261 or 7·07 per cent., and of Connaught by 102,146 or 12·4 per cent. Only one county showed an increase of population during the decennial period—Antrim with 2·1 per cent. increase, due to the growth of Belfast. All the other counties showed a decline, varying from 16·1 per cent. in Monaghan to ·87 per cent. in Down. In 1891 Dublin, with an average of 1177 persons to the square mile, was the most densely populated county, and Wicklow, with an average of only 82 to the square mile, was the least densely populated. The total rural population was 3,460,637, being an average of 110 persons to the square mile, or of 148 persons to each square mile under crops and pasture, and the urban population 1,244,113. Of the total population in 1901, 2,197,739 were males and 2,258,807 females. Between 1891 and 1901 the total population decreased by 248,204 or 5·3 per cent., the population of Leinster by 41,297 or 3·5 per cent., of Munster by 98,568 or 8·4 per cent., of Ulster by 38,463 or 2·4 per cent., and of Connaught by 69,876 or 9·7 per cent. Three counties showed an increase—Dublin and Down of 7·3 per cent. each, and Antrim of 7·0 per cent. All the others showed a decline, varying from 13·6 per cent. in Monaghan to 5·1 per cent. in Londonderry. Between 1881 and 1891 the population of towns of 10,000 inhabitants and upwards increased by 30,375, this increase being altogether owing to the growth of Belfast, Londonderry, and a few other industrial towns in the north, and to the extension of the Dublin suburbs.

Between 1891 and 1901 the population of the same towns increased by 160,076, the increase being largely due to the extension of the municipal boundaries of Dublin and Belfast. All other towns either remained practically stationary or seriously diminished during both decennial periods, because they are not centres of industry, but mainly markets for the agricultural produce of the vicinity. The following table shows the population of the six county boroughs in 1881, 1891, and 1901:—

Year.	Dublin.	Belfast.	Cork.	Limerick.	Londonderry.	Waterford.
1881	249,602	208,122	80,124	38,562	29,162	22,457
1891	268,587	273,079[2]	75,345	37,155	33,200	26,203
1901	289,108[1]	348,965	75,978	38,085	39,873	26,743

[1] The municipal area was extended in 1900.
[2] By the extension of the municipal area in 1897 the population of Belfast was largely increased.

The table given below proves that the number of Irish-speaking persons decreased between 1881 and 1891:—

Provinces.	1881. Who spoke Irish only.	1881. Who spoke Irish and English.	1881. Total who could speak Irish.	1891. Who spoke Irish only.	1891. Who spoke Irish and English.	1891. Total who could speak Irish.	Percentage of Population who could speak Irish. 1881.	Percentage of Population who could speak Irish. 1891.
Leinster	50	27,402	27,452	8	13,669	13,677	2·1	1·2
Munster	18,422	427,344	445,766	9,060	298,573	307,633	33·5	26·2
Ulster	12,360	98,163	110,523	7,053	77,099	84,152	6·3	5·2
Connaught	33,335	332,856	366,191	22,071	252,712	274,783	44·6	37·8
Ireland	64,167	885,765	949,932	38,192	642,053	680,245	18·2	14·5

The number of families in 1891 was 932,113, of which 97,317 inhabited 1st class, 499,033 2nd class, 315,034 3rd class, and 20,729 4th class houses. The number of families in 1901 was 910,508, a decrease of 2·3 per cent. It will be seen from the tables given below that between 1881 and 1891 both the number of 4th class houses and the number of families with 4th class house-accommodation were largely diminished.

The numbers of the different classes[1] of inhabited houses and the number of uninhabited houses in 1881 and 1891 were:—

Provinces.	Number of Inhabited Houses. 1881.	Number of Inhabited Houses. 1891.

Uninhabited Houses.		
Built	58,257	69,320
Building	1,710	2,602
Total	59,967	71,922

[1] The 4th class includes all single-room houses built of mud or perishable material; the 3rd, houses with from two to four rooms and windows; the 2nd, good farmhouses or small town houses having 5 to 7 rooms and windows; the 1st, all houses of a better description than the preceding.

In 1901 there were altogether 858,503 houses inhabited, thus distributed: 205,867 in Leinster, 193,663 in Munster, 332,106 in Ulster, and 126,867 in Connaught, and in addition 72,582 uninhabited houses and 2592 building.

The number of families in each class[2] of house-accommodation in 1881 and 1891 was:—

Class of House-accommodation.	Number of Families in 1881.	Number of Families in 1891.
1st class	57,673	62,613
2nd ,,	403,862	454,870
3rd ,,	443,247	359,308
4th ,,	90,292	55,322
Total	995,074	932,113

If we take into consideration the number of inhabited houses in the whole of Ireland, it will be found that in 1881 there were 5·6 persons in each house, in 1891 there were 5·4 persons, and in 1901, 5·2.

The table which follows on the next page shows the number of persons returned as belonging to different occupations in 1881 and 1891:—

[2] 1st class accommodation consists of 1st class houses occupied by 1 family; 2nd class of 2nd class houses occupied by 1 family, or of 1st class houses occupied by 2 or 3 families; 3rd class of 3rd class houses with 1 family each, 2nd class houses with 2 or 3 families, and 1st class houses occupied by 4 or 5 families; and 4th class of all 4th class houses, 3rd class houses with more than 1 family, 2nd class houses with 4 or more families, and 1st class houses occupied by 6 or more families.

Year.	Pro-fessional.	Domestic.	Com-mercial.	Agri-cultural.	Industrial.	Indefinite and Non-Productive.
1881	198,684	426,161[1]	72,245	997,956	691,509	2,788,281
1891	214,243	255,144	83,173	936,759	656,410	2,559,021[1]

The numbers of permanently and of temporarily diseased persons and percentage to population in 1871, 1881, and 1891, were thus returned :—

Nature of Disablement.	Years.		
	1871.	1881.	1891.
Dumb, and deaf and dumb	5,554	5,13[illegible]	4,464
Blind	6,347	6,111	5,341
Lunatic and idiotic	16,505	18,413	21,188
Total, permanently diseased	28,406	29,660	30,993
Sick at home	23,923	17,805	16,466
Sick in infirmaries and hospitals	3,625	4,170	4,490
Sick in workhouse hospitals	16,485	18,115	14,789
Total temporarily diseased	44,033	40,090	35,745
Sum total	72,439	69,750	66,738
Percentage to population	1·3	1·3	1·4

The increase in the number of insane is marked: in 1871 the proportion to the total population was 1 in 678 ; in 1891, 1 in 535.

Movement of Population.—The births and deaths registered in the different provinces from 1897 to 1900 were :—

Provinces.	Births.				Deaths.			
	1897.	1898.	1899.	1900.	1897.	1898.	1899.	1900.
Leinster	27,305	27,108	26,870	26,089	24,058	23,524	23,338	25,157
Munster	24,899	24,544	24,109	23,500	18,520	19,085	17,991	20,518
Ulster	39,567	39,542	38,982	38,109	30,987	29,771	29,353	31,880
Connaught	14,893	14,263	13,939	13,761	10,274	10,024	9,017	10,051
Total	106,664	105,457	103,900	101,459	83,839	82,404	79,699	87,606

Thus the number of births registered in Ireland exceeded the number of deaths in 1897 by 22,825, in 1898 by 23,053, in 1899 by 24,201, and in 1900 by 13,853 ; but the decrease of population, which still continues, is explained by the fact that the number of emigrants is always larger than the excess of births over deaths, and the number of immigrants is altogether insufficient to redress the balance. The number of illegitimate births in 1900 was 2702.

The number of marriages registered in the different provinces from 1890 to 1900 was :—

Provinces.	1890.	1891.	1892.	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.
Leinster	5,868	5,958	5,901	6,167	6,030	6,403	6,409	6,207	6,207	6,221	5,934
Munster	4,640	4,653	4,783	4,777	4,606	4,921	4,773	4,951	4,818	4,849	4,431
Ulster	8,146	8,504	8,455	8,412	8,600	9,171	9,347	9,279	9,226	8,917	8,623
Connaught	2,336	2,360	2,391	2,358	2,366	2,625	2,526	2,454	2,329	2,324	2,342
Total	20,990	21,475	21,530	21,714	21,602	23,120	23,055	22,891	22,580	22,311	21,330

Of the total population in 1891 (of those of seventeen years and upwards), 47 per cent. were unmarried, 42 per cent. married, and 11 per cent. widowed. In 1900, 14,795 Roman Catholic marriages were celebrated, and 6535 Protestant and other marriages. The number of marriages in 1900 was equal to 4·78 per 1000 of the estimated population, being ·05 below the average of the previous ten years.

The number of emigrants — natives of Ireland — from each province and from all Ireland, from 1st May 1851 to 31st December 1900, is shown by the following table :—

Provinces.	Number from 1st May 1851 to 31st Dec. 1896.	Number in each Year.				Total Number from 1st May 1851 to 31st Dec. 1900.			Per cent. of Emigration in 1898 to Population in 1891.
		1897.	1898.	1899.	1900.	Males.	Females.	Total.	
Leinster	669,260	3,210	3,340	3,542	3,857	359,045	324,164	683,209	0·3
Munster	1,287,387	12,798	13,013	15,758	17,933	689,525	657,364	1,346,889	1·5
Ulster	1,054,232	6,266	5,577	8,701	9,438	599,363	484,851	1,084,214	0·5
Connaught	568,576	10,261	10,311	13,231	14,060	293,645	322,794	616,439	1·9
Unclassified	110,668	..	..	..	..	61,766	48,902	110,668	..
Total, Ireland	3,690,123	32,535	32,241	41,232	45,288	2,003,344	1,838,075	3,841,419	0·9

In the four separate years for which statistics are given above the emigrants were scattered as follows :—

Year.	Colonies and Foreign Countries.					Great Britain.	
	U.S.A.	Australia.	New Zealand.	Canada.	Other Countries.	England and Wales.	Scotland.
1897	28,760	676	61	397	360	1454	827
1898	27,855	837	36	456	248	1667	1142
1899	35,433	1005	56	397	200	2633	1508
1900	37,765	834	64	472	103	4123	1927
Total	129,813	3352	217	1722	911	9877	5404

Emigration continues to be the chief drain on the population of Ireland, and, as the above tables show, the numbers considerably increased in 1899 and 1900 as compared with the two previous years. The largest number that emigrated from any individual county from 1851–1900 was 500,239 from Cork. In 1900 there were 1819 emigrants not of Irish nationality, making the total number of emigrants for 1900, 47,107. Of these the Irish emigrants from Leinster formed 8·2 per cent. ; from Munster, 38·1 per cent. ; from Ulster, 20·0 ; from Connaught, 29·8 per cent. ; while the non-Irish emigrants formed the remaining 3·9 per cent. The vast majority—82·2 per cent—of the emigrants were persons between fifteen and thirty-five years of age. The males numbered 23,295, and the females 23,812.

Constitution and Government.—The Redistribution of Seats Act, 1885, entirely altered the parliamentary representation of Ireland. The following twenty-two boroughs were disfranchised: Armagh, Athlone, Bandon, Carlow, Carrickfergus, Clonmel, Coleraine, Downpatrick, Drogheda, Dundalk, Dungannon, Dungarvan, Ennis, Enniskillen, Kinsale, Lisburn, Mallow, New Ross, Portarlington, Tralee, Wexford, and Youghal. Galway, Limerick, and Waterford lost one member each. Dublin and Belfast were divided into four divisions, each returning one member. In all, 85 members represent the counties, 16 the cities and towns, and 2 Dublin University—a total of 103. Excluding the University of Dublin, the number of registered electors in 1901 was 731,132—counties 622,465, and boroughs 108,667; while in 1891 the number was 736,259—counties 642,533, and boroughs 93,726. By section 2 of the Representation of the People Act, 1884, a uniform household franchise and a uniform lodger franchise were established in all counties and boroughs of the United Kingdom, and by section 3 the service franchise was introduced.

By the Local Government (Ireland) Act, 1898, the system of local government in Ireland was entirely remodelled. A county council, consisting of a chairman and councillors, was established in each administrative county. For this purpose new administrative counties were formed, in some cases by the alteration of existing boundaries, in other cases by the adoption without alteration of the old judicial counties. Thus, the judicial counties of Antrim, Armagh, Carlow, Clare, Down, Dublin, Galway, Kilkenny, Londonderry, Louth, Mayo, Queen's County, Roscommon, Sligo, Westmeath, Wexford, and Wicklow, have been either diminished or increased in area; Cavan, Cork, Donegal, Fermanagh, Kerry, Kildare, King's County, Leitrim, Limerick, Longford, Meath, Monaghan, and Tyrone, retain their boundaries unaltered, and Tipperary has been divided into two administrative counties almost identical with the old North and South Ridings. To the county council the Act transferred all the fiscal and administrative duties of the grand jury, with the exception of the power of making presentments for malicious injury, which passed over to the

[1] Housekeepers who were wives or other near relations of heads of families were tabulated in 1881 in Class II. and in 1891 in Class VI.

county courts. Besides these powers of the grand jury, the county council has now the power of the board of guardians with regard to raising and levying the poor rate; that is to say, all the rates in so much of the county as is not included in an urban district are now raised by the county council in one general rate. In addition, the administration of the Diseases of Animals Act, the Explosives Act, and the Acts relating to technical education and the management of lunatic asylums, was vested in the county council, upon which were also conferred extensive powers for acquiring land for county purposes, and a number of other duties. The county council is elected by the parliamentary electors of the county, with the addition of women and peers otherwise qualified to vote. Subordinate bodies, called district councils, were established by the same Act to manage the affairs of the various local areas within each county. It was provided (1) that, where an urban sanitary authority existed at the passing of the Act, an urban district council should be formed, having within its own area all the powers of the grand jury with regard to roads, &c., and with the right to raise its own rates, but subject to some general control by the county council, and liable for certain contributions; and (2) that, in the areas where no urban sanitary authority existed at the passing of the Act, rural districts, governed by rural district councils, should be formed, corresponding, as far as possible, with the existing poor-law unions. The rural district councillors elected for each division also act as the poor-law guardians for that division, so that in all rural unions, situated wholly within the county, which do not include any town that is an urban district, there are now two bodies having the same members, but discharging different functions. But where an urban district is included within the limits of a union, or where a union extends over more than one county, and particularly where both these conditions are present, the constitution of the board of guardians is very complex, and would require a more detailed explanation than can be given here. In order to facilitate the working of the Act in this respect, the Local Government Board was given power to alter the boundaries of poor-law unions. With regard to the effect of the Act on cities and towns, these may now be grouped in five classes: (1) county boroughs—Dublin, Belfast, Cork, Limerick, Londonderry, and Waterford—governed by separate county councils; (2) five boroughs—Kilkenny, Sligo, Clonmel, Drogheda, and Wexford—which retain their corporations, but practically rank as urban sanitary districts; (3) urban sanitary districts, governed by urban district councils; (4) towns having town commissioners who are not sanitary authorities; and (5) non-municipal towns with populations of over 1500, and entitled to petition for town commissioners. The Act provides special facilities for the conversion of any of the two latter classes of towns into urban districts.

Justice.—By the Act of 1887, to amend the Supreme Court of Judicature (Ireland) Act, 1877, the office of Chief Justice of the Common Pleas, from the passing of the Act, was reduced to an equality with the office of puisne judge; the rank and title were abolished. It was provided that the office of Chief Baron of the Exchequer should be similarly treated on the occasion of the first vacancy, and that the Lord-Lieutenant should have the power to consolidate by an Order in Council the Common Pleas Division with the King's Bench Division. By a further amending Act in 1897 the Exchequer Division was amalgamated with the King's Bench Division—the chief baron to rank after the lord chief justice—the Court of Bankruptcy was consolidated with the Supreme Court, and it was enacted that on the next vacancy in the judgeship, the Probate and Matrimonial Division should be abolished and the division amalgamated with the King's Bench Division. By the Land Law (Ireland) Act, 1881, a Land Commission was established, consisting of a judicial commissioner, who was to become an additional judge of the Supreme Court of Judicature, and two other commissioners. By subsequent enactments the commission was made perpetual, and the number of commissioners other than the judicial commissioner was increased to four. As a result of all these changes the Supreme Court of Judicature in Ireland is now constituted as follows:—The Court of Appeal, which consists of the Lord Chancellor, the Lord Chief Justice, the Master of the Rolls, and the Chief Baron of the Exchequer as *ex-officio* members, and three lords justices of appeal; and the High Court of Justice, which includes (1) the Chancery Division, composed of the Lord Chancellor, the Master of the Rolls, the Vice-Chancellor, and a land judge; (2) the King's Bench Division, composed of the Lord Chief Justice, the Chief Baron of the Exchequer, and eight justices, who include the Probate, the Admiralty, and the Bankruptcy judges; and (3) the Land Commission, the judicial commissioner alone ranking as a member of the Supreme Court. By the County Officers and Courts (Ireland) Act, 1877, it was provided that the chairmen of quarter sessions should be called "county court judges and chairmen of quarter sessions," and that their number should be reduced to twenty-one, which number was to include the recorders of Dublin, Belfast, Cork, Londonderry, and Galway. At the same time the jurisdiction of the county courts was largely extended. There are now 70 resident (stipendiary) magistrates in Ireland, and 4 police magistrates for the Dublin police district. On 30th September 1900 the Royal Irish Constabulary was composed of an inspector-general, a deputy-inspector-general, 2 assistant-inspector-generals, a surgeon, a veterinary surgeon, a barrack-master and store-keeper, a police instructor and schoolmaster, a town inspector (Belfast), 36 county inspectors, 214 district inspectors, 251 head constables, 1869 sergeants, 423 acting-sergeants, and 8371 constables. The expenditure on the force in 1901–2 was £1,376,406.

The following table gives the number of persons committed for trial, convicted, and acquitted in Ireland in 1881, 1886, 1891, and 1900:—

Year.	Committed for Trial.	Convicted.	Acquitted.
1881	5311	2698	2443
1886	3028	1619	1286
1891	2112	1255	669
1900	1682	1087	331

Of the 1682 persons committed in 1900, 639 were charged with offences against the person, 132 with offences against property with violence, 606 with similar offences without violence, 104 with malicious offences against property, 35 with forgery and offences against the currency, and 166 with other offences.

The number and nature of agrarian offences between 1881 and 1900 are thus returned:—

Year.	Against Person.	Against Property.	Against Public Peace.	Threatening Letters, &c.	Total.
1881–90	917	2595	3795	6793	14,100
1888	53	161	197	249	660
1889	37	155	148	194	534
1890	48	121	151	199	519
1891	22	145	90	215	472
1892	31	115	67	192	405
1893	24	116	67	173	380
1894	18	82	40	136	276
1895	48	82	14	117	261
1896	17	92	28	114	251
1897	18	81	44	104	247
1898	14	90	39	100	243
1899	16	85	35	110	246
1900	15	75	52	138	280

It will be seen that between 1888 and 1898 the number steadily declined. Between 1881 and 1890, when the land agitation was at its height, agrarian crime enormously increased, the number of offences being nearly treble the number in the previous ten years.

In 1899, 98,401 cases of drunkenness were brought before the Irish magistrates, as compared with 214,298 in England and Wales, and 44,351 in Scotland.

Pauperism.—For the reconstitution of the poor-law authorities, see the paragraph on local government, above.

The aggregate number of persons relieved, and total poor relief expenditure in each year from 1889 to 1898, are shown on the following page.

During 1898–99 the average daily number in receipt of in-door relief was 42,728, and in receipt of out-door relief, 64,604. The corresponding figures during 1899–1900 were 41,980 and 58,012.

On 1st January 1898 the ratio of pauperism to population in Ireland was 1 in every 45 persons, or 2·2 per cent. of the population; and in England and Wales on the same date the ratio was 1 in every 37 persons, or 2·7 per cent. of the population.

Year ending 29th Sept.	Aggregate Number relieved continuously or successively.[1] In-door.	Out-door.	Total.	Total Poor Relief Expenditure. £	Year ending 29th Sept.	Aggregate Number relieved continuously or successively.[1] In-door.	Out-door.	Total.	Total Poor Relief Expenditure. £
1889	369,570	120,655	490,225	853,912	1894	328,094	108,335	436,429	869,674
1890	334,168	120,010	454,178	856,008	1895	316,733	116,633	433,366	863,944
1891	311,604	125,343	436,947	871,424	1896	334,170	99,053	433,223	868,969
1892	315,818	117,708	433,526	869,192	1897	351,828	106,513	458,341	894,846
1893	324,388	107,735	432,123	857,910	1898	375,915	149,189	525,104	981,333

Religion.—In 1891, 3,547,307 or 75·4 per cent. of the inhabitants were Roman Catholics; 600,103 or 12·7 per cent. Protestant Episcopalians; 444,974 or 9·5 per cent. Presbyterians; 55,500 or 1·2 per cent. Methodists; and 56,866 or 1·2 per cent. adherents of other denominations. In 1901 the corresponding figures were 3,310,028 or 74·3 per cent., 579,385 or 13·0 per cent., 443,494 or 10·0 per cent., 61,255 or 1·4 per cent., and 62,384 or 1·3 per cent. Antrim, Down, Armagh, and Londonderry are the only counties in which less than half the inhabitants are Roman Catholics. As compared with 1891, Roman Catholics showed a decrease of 237,279 or 6·7 per cent; Protestant Episcopalians a decrease of 20,718 or 3·5 per cent.; Presbyterians a decrease of 1480 or 0·3 per cent.; and Methodists an increase of 5755 or 10·4 per cent. Jews increased from 1779 to 3769.

The number of bishoprics in the Church of Ireland is now eleven, as the see of Clogher was revived in 1886. In 1899 the clergy numbered 1650, and the churches 1400. For the year ending 31st December 1900 the accounts of the representative body show that the interest on investments amounted to £311,342, 6s. 11d., contributions to diocesan stipend, general and episcopal funds, to £115,012, 3s. 6d., parochial endowments to £41,125, 18s. 8d., and glebe rents to £18,595, 10s.; while, on the side of expenditure, £291,453, 15s. 4d. was paid to diocesan financial schemes, and £35,987, 8s. 7d. in commutations and annuities. On 31st December 1900 there were in the hands of the representative body various capital sums, amounting to more than £8,000,000, derived from the following sources:—£1,500,000, the balance of the commutation money received to pay the annuities of the clergy, £500,000 received in lieu of private endowments, £1,500,000 derived from the composition of annuitants, and £5,000,000 voluntarily contributed.

The whole of the clergy of the Roman Catholic Church in Ireland are supported by various forms of voluntary contributions. In addition to the secular clergy, 70 or 80 communities of different religious orders are scattered throughout the country, ministering in their own churches, but without parochial jurisdiction. At the census of 1891 the total clergy, including archbishops, bishops, private chaplains, and professors, amounted in number to 3502.

From the minutes of the General Assembly of the Presbyterian Church in Ireland in 1900 it appears that in the year ending in March there were 658 ministers, besides 88 licentiates and ordained ministers without charge, 570 congregations, and 481 manses. The following figures show the revenue and expenditure of the Church for the same year:—Pew rents, £53,447; raised for building or repairing churches, manses, and schools, £39,425; raised for the sustentation fund, £23,072; Sabbath collections, £26,904; mission collections, £21,591; other charitable collections, £45,081; stipends paid to ministers, £55,265. The Wesleyan Methodist body in the United Kingdom forms one connexion, but has two conferences, one for Great Britain and the other for Ireland. The president of the British conference is also president of the Irish conference. The number of ministers in Ireland is about 250.

Education.—The following table shows for each province and all Ireland, by religious professions, the percentage of the population, five years old and upwards, who could read and write, read only, and neither read nor write, in 1881 and 1891:—

Provinces.		Roman Catholics. Read and Write.	Read only.	Neither Read nor Write.	Protestant Episcopalians. Read and Write.	Read only.	Neither Read nor Write.	Presbyterians. Read and Write.	Read only.	Neither Read nor Write.	Methodists. Read and Write.	Read only.	Neither Read nor Write.	Other Denominations. Read and Write.	Read only.	Neither Read nor Write.	Totals. Read and Write.	Read only.	Neither Read nor Write.
Leinster	1881	61·2	15·9	22·9	89·6	5·1	5·3	92·4	4·2	3·4	93·5	2·9	3·6	92·3	2·8	4·9	65·3	14·4	20·3

It will be seen that the percentage of illiterates sensibly diminished all over Ireland, and that the provinces occupied the same relative positions, as regards standard of education attained, in 1891 as in 1881. During the week ending 30th May 1891 the proportion per cent. of the total population, between five and sixteen years of age, attending school was 54·1, and not attending school 45·9.

In 1881 the number of universities and other colleges in Ireland was 16, attended by 4288 students, of whom 1919 were Roman Catholics, 1364 Protestant Episcopalians, and 1005 belonged to the Presbyterian and other denominations; in 1891 there were 15 colleges, with 3498 students, of whom 1658 were Roman Catholics, 1046 Protestant Episcopalians, and 794 Presbyterians and other denominations. In 1900 Trinity College, Dublin, had 1076 students on its books, and in the previous year the university conferred 421 degrees. In 1887 medical school buildings were completed at a cost of £20,000. The Royal University of Ireland was founded in 1880, and since 1882 has superseded the old Queen's University. The government is vested in a senate, consisting of a chancellor and not more than 36 senators, with power to confer degrees upon male and female students in all the usual subjects except theology. No residence in any college, nor attendance at lectures, or any other course of instruction, is obligatory. There are fellowships and examinerships attached to the university. At the first matriculation examination in December 1881, 508 candidates, including 25 females, passed; in 1900 the number was 688, which included 170 females. The entire number of persons who passed the academic examinations in 1900 was 1783 out of 2658 candidates. The revenue of the university for the year 1900–1 was £39,488, and the expenditure £24,847. The three Queen's Colleges of Belfast, Cork, and Galway, which formed the Queen's University, still exist as university colleges. The buildings of the college at Belfast have been largely increased of recent years. The number of students attending the three colleges in 1899–1900 was 635—Belfast 347, Cork 178, and Galway 110. In the same year the number that entered was 197—Belfast 99, Cork 51, and Galway 47. Practically all the students graduate in the Royal University. In 1882 the Roman Catholic bishops resolved to place the buildings of the Roman Catholic University in Dublin, which is wholly supported by voluntary contributions, under the control of the archbishop of Dublin, who undertook to maintain a college where instruction would be given in arts and medicine according to the requirements of the Royal University. In 1883 the direction of the college was entrusted to the Jesuit Fathers. Several of the fellows of the Royal University are professors in the college. In 1881 the faculty of the Presbyterian General Assembly's College, Belfast, and the theological professors of the Magee College, Londonderry, were incorporated by Royal Charter, and constituted as a faculty, with power to grant degrees in divinity. The Magee College, whose professors must all sign the Westminster Confession of Faith, though no religious test is prescribed for

[1] Exclusive of persons in institutions for the blind, deaf and dumb, and for idiots or imbeciles. During the ten years 1889–98 these persons averaged about 950 in each year.

students, provides literary and scientific education as well as theological.

In 1900 the examinations of the Intermediate Education Board were held at 247 centres. The number of candidates for examination was 7608 (boys 5611, and girls 1997), of whom 5314 passed (boys 3799, and girls 1515). 84 boys and 24 girls gained exhibitions (£20 for one year) in the preparatory grade, 190 boys and 83 girls exhibitions (£20 for three years) in the junior grade, 60 boys and 24 girls exhibitions (£30 for two years) in the middle grade, and 20 boys and 11 girls exhibitions (£50 for one year) in the senior grade, while 651 boys and 292 girls were awarded prizes. In 1880 the number of candidates was 5561 (boys 4114, and girls 1447), of whom 4010 passed (boys 2899, and girls 1111). The amount of results fees paid to managers of schools in 1900 was £56,158—£41,098 for boys and £15,060 for girls.

The following table shows the number of primary and superior schools, with details of their pupils, for 1881 and 1891 :—

Schools.		Number of Schools.				Number of Pupils and Religious Professions.						Total Pupils, Male and Female.
		Male.	Female.	Mixed.	Total.	Roman Catholics.		Protestant Episcopalians.		Presbyterians and Others.		
						M.	F.	M.	F.	M.	F.

The number of National schools, the number of pupils on the rolls, and the amount of parliamentary grants from 1881 to 1900, are thus returned :—

Years.	Number of Schools.	Number of Pupils.	Amount of Grant.
			£
1881	7648	1,066,259	729,868
1885	7936	1,075,604	814,003
1891	8346	1,022,361	866,539
1896	8606	808,939 [1]	1,186,187
1897	8631	798,972	1,276,560
1898	8651	794,818 [2]	1,304,734
1899	8670	785,139	1,299,117
1900	8684	745,861	1,387,503

On 31st December 1900 the National Board had in their service 8244 principal teachers and 3684 assistants, 897 work-mistresses and industrial teachers, 13 junior literary assistants, 32 temporary assistants, 5 temporary work-mistresses. The total emoluments from all sources, available for the teaching staff for the year ending 31st March 1901, was £1,174,690. The total receipts of the National Board for the same year were £1,492,172 (including a parliamentary grant of £1,387,503), and the expenditure was £1,465,480.

The following table gives details for 31st December 1900 :—

Province.	Number of Schools.	Number of Pupils.				Average Daily Attendance.
		Roman Catholics.	Protestant Episcopalians.	Others.	Total.	
Leinster .	1795	146,176	15,629	2,767	164,572	107,088
Munster .	2115	182,170	6,840	1,351	190,361	126,964
Ulster .	3249	111,383	62,284	92,838 [3]	266,605	172,593
Connaught	1525	119,791	3,922	610	124,323	71,629
Total .	8684	559,520	88,675	97,666	745,861	478,224

In 1900 the average number of inmates in the six reformatory schools was 584, and the cost of maintenance and management was £13,780. In the same year the number of schools having certificates under the Irish Industrial Schools Act, 1868, was 70—8 Protestant (3 for boys and 5 for girls), and 62 Roman Catholic (17 for boys, 44 for girls, and 1 mixed). The total number of inmates was 7802.

On 31st December 1900 there were, throughout Ireland, 30 model schools, with 8871 pupils on the rolls and an average daily attendance of 6547; 150 workhouse schools, with 4422 pupils on the rolls and an average daily attendance of 3747.

The Irish Education Act of 1892 provided that the parents of children of not less than 6 nor more than 14 years of age should cause them to attend school, unless there was a reasonable excuse for non-attendance, on at least 150 days in the year in municipal boroughs and in towns or townships under commissioners. It was also enacted that any county council which might be established by any future Act might by resolution, and should, on application made by any baronial council (now rural district council), apply the foregoing provision to any part of their county. The commissioners were empowered by the same Act to acquire land for school-houses and teachers' residences, and provisions were made for the partial or total abolition of fees in specified circumstances, and for a parliamentary school grant, in lieu of abolished school fees, for the augmentation of the salaries of the National teachers.

Under the Educational Endowments (Ireland) Act, 1885, a scheme was prepared for altering the constitution of the old "Commissioners of Education," who had the management of the endowed and diocesan schools, and for the future control of the Ulster royal schools. A Protestant and a Roman Catholic Board were constituted for each of the following districts: Armagh, Tyrone (with part of Londonderry), Fermanagh (with part of Monaghan), Cavan, and Donegal. The endowments are now distributed in equal shares. In 1900 the receipts of the commissioners amounted to £8098.

Finance.—The amount of imperial revenue collected in Ireland during the five years ending 31st March 1900 was :—

Years.	Customs.	Excise.	Stamps.	Property and Income Tax.	Post Office and Telegraphs.	Miscellaneous.	Total Revenue.	Estimated True Revenue.	Per Head of Estimated Population.
	£	£	£	£	£	£	£	£	£ s. d.
1896	2,152,000	5,299,000	917,000	703,000	795,000	164,000	10,030,000	8,034,000	1 15 1
1897	2,176,000	5,361,000	1,010,000	666,000	809,000	168,000	10,190,000	8,146,000	1 15 9
1898	2,221,000	5,449,000	943,000	670,000	824,000	146,000	10,253,000	8,114,000	1 15 8
1899	2,002,000	5,518,000	1,035,000	687,000	846,000	159,000	10,247,000	8,202,000	1 16 1

The amount of imperial revenue expended in Ireland during the same five years was :—

Years.	Consolidated Fund.	Voted.	Local Taxation Accounts.		Civil Charges.	Collection of Taxes.	Post Office Services.	Total Expenditure.	Estimated True Revenue.	Contribution.
			Local Taxation Revenue.	Exchequer Revenue.						
	£	£	£	£	£	£	£	£	£	£
1896	177,000	4,330,000	353,000	40,000	4,902,000	228,000	807,000	5,937,000	8,034,000	2,097,000
1897	177,000	4,297,000	401,000	40,000	4,915,000	232,000	823,000	5,970,000	8,146,000	2,176,000
1898	174,000	4,302,000	511,000	40,000	5,027,000	241,000	866,000	6,134,000	8.114,000	1,980,000
1899	176,000	4,265,000	447,000	404,000	5,292,000	242,000	943,000	6,477,000	8,202,000	1,725,000
1900	179,000	4,072,000	409,000	1,053,000	5,713,000	242,000	1,025,000	6,980,000	8,664,500	1,684,500

From a variety of circumstances it is extremely difficult to arrive at even an approximate estimate of the wealth of Ireland. The following statistics, however, may serve as a sort of summary estimate of Irish property in 1900–1, though many important factors, such as the amount of capital invested in the linen industry, cannot be included owing to the uncertainty of the figures: —Tenement valuation, £14,933,524; value of crops, £30,104,392;

[1] Number of pupils on the rolls on 31st December.

[2] Number of pupils on the rolls on 30th September. Prior to 1896 the basis of the returns was the total number on the rolls who had made at least one attendance in the year.

[3] 81,149 Presbyterians.

value of live stock, £82,145,137; paid-up capital and reserve funds of joint-stock banks, £10,910,512; deposits in joint-stock banks, in trustee savings banks, and in P.O. savings banks, £52,197,000; investments in Government stock, transferable at the Bank of Ireland, £30,395,000; paid-up share and debenture capital of railways, £39,765,573; paid-up stock and share capital of tramway companies, £1,833,003; fisheries—value of exports, £367,655; mines—value of productions, £239,840; total, £262,891,636. In this connexion it may be noted that deposits in joint-stock banks rose from £28,289,000 in 1881 to £41,568,000 in 1901; deposits in trustee savings banks from £2,078,707 in 1881 to £2,340,000 in 1901; and deposits in P.O. savings banks from £1,645,000 in 1881 to £8,289,000 in 1901. The amount of Government and other stock on which dividends are paid at the Bank of Ireland rose from £28,289,000 in 1881 to £30,395,000 in 1901. In the year ending 5th April 1900 the net annual value of property and profits assessed to the income tax was £24,439,941.

In 1897 the local taxation of Ireland amounted to £3,978,136, as compared with £3,559,093 in 1890. More than 75 per cent. of the total amount was raised by rates on real property. The Local Government (Ireland) Act, 1898, effected considerable changes in local finance. Each county council has now three sources of revenue: (1) The agricultural grant; (2) the licence duties and other imperial grants; and (3) the poor rate,—which it will be convenient to consider separately. (1) It was provided by the Act that the Local Government Board should ascertain the amount of county cess and poor rate levied off agricultural land in Ireland during the year ending, as regards the poor rate, on 29th September, and, as regards the county cess, on 21st June, 1897, and that half this amount, to be called the agricultural grant, should be paid annually, without any variation from the original sum, out of the consolidated fund to a local taxation account. The amount of the agricultural grant has now been ascertained to be £727,655. Elaborate provisions were also made in the Act for fixing the proportion of the grant to which each county should be entitled, and the Lord-Lieutenant was empowered to pay half-yearly the proportion so ascertained to the county council. (2) Previous to the passing of the Act, grants were made from the imperial exchequer to the grand juries in aid of the maintenance of lunatics, and to the boards of guardians for medical and educational purposes, and for salaries under the Public Health (Ireland) Act. In 1897 these grants amounted to £236,483. Under the Local Government Act they ceased, and in lieu thereof it was provided that there should be annually paid out of the consolidated fund to the local taxation account a sum equal to the duties collected in Ireland on certain specified local taxation licences. In addition, it was enacted that a fixed sum of £79,000 should be forthcoming annually from the consolidated fund. (3) The county cess was abolished, and the county councils now levy a single rate for the rural districts and unions, called by the name of poor rate, for all the purposes of the Act. It is made upon the occupier and not upon the landlord, and the occupier is not entitled, save in a few specified cases, to deduct any of the rate from his rent. The total amount raised by the poor rate in the year ending 29th September 1898 was £1,087,920.

The total amount issued on loan, exclusive of closed services, by the Commissioners of Public Works in Ireland up to 31st March 1900 was £24,228,037, which included the loans granted under the Land Improvement Acts, the Seed Supply Acts, and section 31 of the Land Act, 1881 (*Agriculture* below). On the same date there had been repaid of the principal sum £13,531,079, £7,141,423 had been paid by way of interest, and £1,597,050 had been remitted. The balance outstanding was—principal £9,099,908, and interest £193,892. Exclusive of the loans already mentioned, the following were the chief items of the total amount: —Railways £1,200,127, lunatic asylum buildings £2,620,385, public health £2,690,278, Labourers' Acts £1,830,188, river drainage and navigation £2,082,052, grand juries for roads, &c., £807,667.

In 1894 a Royal Commission was appointed to consider the financial relations between Great Britain and Ireland and the taxable capacity of the two countries, and presented a voluminous final report in 1896. The commissioners differed on several points, but were practically agreed on the following five conclusions: (1) That Great Britain and Ireland must, for the purposes of this inquiry, be considered as separate entities; (2) that the Act of Union imposed upon Ireland a burden which, as events showed, she was unable to bear; (3) that the increase of taxation laid upon Ireland between 1853 and 1860 was not justified by the then existing circumstances; (4) that identity of rates of taxation did not necessarily involve equality of burden; (5) that, whilst the actual tax revenue of Ireland was about one-eleventh of that of Great Britain, the relative taxable capacity of Ireland was very much smaller, and was not estimated by any of the commissioners as exceeding one-twentieth. Since its publication the report has become a standing subject of political and economic controversy. (See *History* below.)

Defence.—The militia has been reorganized under recent army regulations, and now consists of the 3rd and 4th battalions of certain of the territorial regiments.

Production and Industry.

By the Purchase of Land Act, 1891, a body was constituted, called the Congested Districts Board, composed of the Chief Secretary, a member of the Land Commission, and five other members. The Act placed at the disposal of the Board the Irish Reproductive Loan Fund, the Sea and Coast Fisheries Fund (except the sum of £20,000—see *Fisheries* below), and the interest, at the rate of $2\frac{1}{2}$ per cent., on a sum of £1,500,000 charged on the Irish Church Temporalities Fund. It was provided that where more than 20 per cent. of the population of a county lived in electoral divisions of which the total rateable value, when divided by the number of the population, gave a sum of less than £1, 10s. for each individual, these divisions should, for the purposes of the Act, form a separate county, called a congested districts county, and should be subject to the operations of the Board. In order to ameliorate the condition of affairs in these separate counties, the Board was empowered (1) to amalgamate small holdings (within certain specified limits), either by directly aiding migration or emigration of occupiers from one holding to another, or by recommending the Land Commission to facilitate amalgamation, and (2) generally to aid and develop, out of its resources, agriculture, forestry, the breeding of live stock, weaving, spinning, fishing (including the construction of piers and pontoons, and the supply of boats and gear), and any other suitable industries. Further provisions regulating the operations of the Board were made by an Act of 1893, and by the Land Law Act, 1896. By its constituting Act, the new Department of Agriculture, &c., was empowered to exercise and discharge, at the request of the Board, any of its powers and duties in a congested districts county. For the year ending 31st March 1899 the receipts of the Board were £111,152, and the expenditure £106,165. By an Act of 1899, a Department of Agriculture and other Industries and Technical Instruction was established in Ireland. The Chief Secretary is president of the department, to which have been transferred the powers and duties of the Lord-Lieutenant, under the Diseases of Animals Acts, 1894 and 1896; under the Destructive Insects Act, 1877, and the Fertilizers and Feeding Stuffs Act, 1893; the powers and duties of the Registrar-General and of the Land Commission with reference to the collection of statistics; the powers and duties of the Land Commission under the Markets and Fairs (Weighing of Cattle) Acts, 1887 and 1891; the administration of the grant for science and art in Ireland; the administration of the grant for technical education; the powers and duties of the Department of Science and Art in relation to any public building or institution under their control, and also any property held by them; and the powers and duties of the inspectors of Irish fisheries, who are henceforth to be officers of the department. To assist the department, the Act also provided for the establishment of a Council of Agriculture, an Agricultural Board, and a Board of Technical Instruction, specifying the constitution of each of the three bodies. Certain moneys (exceeding £180,000 per annum) were placed by the Act at the disposal of the department, provisions were made for their application, and it was enacted that local authorities might contribute funds.

Minerals.—The mineral output of Ireland is still very limited, and the production of lead and copper, the combined value of which in 1876 was over £50,000, has now practically ceased, as has the production of silver. In 1900 the coal mines in Kilkenny,

Mineral.	1899.		1900.	
	Quantity.	Value.	Quantity.	Value.
	Tons.	£	Tons.	£
Coal	125,420	51,460	124,699	62,249
Iron ore	102,262	16,015	99,641	17,670
Salt	47,055	13,319	44,194	7,554
Slate	5,443	13,410	5,637	14,433
Other minerals	...	125,926	...	137,834
Total	...	220,130	...	239,740

Queen's County, Tipperary, Antrim, Tyrone, Leitrim, and Roscommon produced 124,699 tons, of the value of £62,249, Kilkenny having the largest output, with 62,817 tons of anthracite coal. In the same year eleven iron ore mines were worked in County Antrim, and produced 99,641 tons, valued at the mines at £17,610. In 1892 the output of iron ore was 76,739 tons, of the value of £11,625. Rock salt of a superior quality is raised at Carrickfergus in County Antrim, the production in 1900 having

been 44,194 tons, valued at £7554. Alum clay or bauxite is found in beds between sheets of Tertiary basalt in the same county. The quantity raised from five mines in 1900 was 5779 tons, valued at the mines at £1350. The alumina is prepared at works near Larne, and the quantity extracted in 1900 was 1600 tons, value £30,500, which produced 560 tons of aluminium, value £72,800. The preceding table contains a general summary of the mineral output of Ireland in 1899 and 1900.

Agriculture.—The Land Act of 1881 provided that a fair rent

Method of Procedure.	Number of Holdings.	Extent in Acres.	Old Rents.	Judicial Rents.	Reduction per cent.

when fixed could not be raised or altered for fifteen years—the first statutory term—and that a second term could be fixed in the last year of that period at a revised rent. The table above shows the number of fair rents fixed between 22nd August 1881 and 31st March 1900. The judicial rents fixed for the first statutory term show a reduction of a fraction over 20 per cent. on the old rents; those fixed for the second statutory term, a still further reduction of over 22 per cent. In addition, 154 judicial leases (*i.e.*, leases approved by the court to exclude the Act of 1881) were executed during the same period, and 45 fixed tenancies (*i.e.*, tenancies to which the Act of 1881 does not apply) were sanctioned. Since the Land Act of 1881, which seemed to the tenant a near approximation to the "three f's"—free sale, fair rent, and fixity of tenure,—several measures have been passed dealing with the tenure and purchase of land in Ireland. By the Purchase of Land (Ireland) Act, 1885, which was described as "an Act to provide greater facilities for the sale of land to occupying tenants," elaborate provisions were made for advances by the Land Commission (established by the Act of 1881) in order to enable tenants to purchase their holdings either from the Land Commission itself or from their landlords, and for the repayment of such advances. For the purpose of advances, or of purchases of estates by the Land Commission, it was further enacted that any sum or sums, not exceeding in all £5,000,000, might be issued out of the consolidated fund. The Acts of 1881 and 1885 were amended and extended by the Land Law (Ireland) Act, 1887. By the Purchase of Land Amendment Act, 1889, the Land Commission was empowered to advance money to tenants to purchase lands to increase the size of their holdings. The Purchase of Land Act, 1891, provided further funds for the purchase of land by tenants, established the Land Commission as a permanent tribunal, and constituted a body called the Congested Districts Board (see above). The Land Law Act of 1896 contained further provisions for the fixing of fair rents and certain regulations as to the duties of the Land Judge and the Judicial Commissioners, and amended in some respects the previous law as to the purchase of land. There is no provision for compulsory sale in any of the Acts.

The following table shows, by provinces, applications for loans

Provinces.	Under Act of 1885. From August 1885 to March 1900.				Under Acts of 1891 and 1896. From August 1891 to March 1900.				Total Loans Issued.

and loans issued under the Land Purchase Acts, 1885, 1891, and 1896, from 22nd August 1885 to 31st March 1900.

[1] Judicial rents for first statutory term.
[2] The number of tenants is the same as the number of loans.

Under an act of 1898 money can be lent to Boards of Guardians for the supply of seed potatoes, seed oats, and potato spraying machines and spraying material to occupiers of land unable through poverty to obtain such supplies. Up to 31st March 1900, £78,670 had been so advanced. Under the previous Seed Supply Acts a sum of nearly £1,000,000 has been advanced by the Commissioners of Public Works.

The amount *sanctioned* under the Act of 1885 was £9,992,640 to 25,368 tenants. In the first year the purchase money actually issued was 18·3 years' purchase on the rental, the highest figure ever reached. In 1897 it fell to 15·2 years' purchase, and the average for the entire period was 17 years' purchase. The amount *sanctioned* under the Acts of 1891 and 1896 was £7,550,765 to 24,337 tenants. The purchase money actually issued was 17·3 years' purchase on the rental.

Below are given the number and amount of loans issued in each county and province under the Land Improvement Acts from 1847 to 1900.

Over £4,000,000 was applied for drainage purposes. During the year ending 31st March 1900, 294 applications were received under these Acts, and £38,900 was issued. Under sect. 19 of the Land Act 1881, 260 loans, amounting to £15,275, to tenant farmers for labourers' dwellings, were sanctioned up to 31st March 1900. A large number of loans are made under sect. 31 of the same Act, and the

Total—Ireland	14,856	1,245,437	1,071,106

The following table gives the number of different holdings in each province and in all Ireland in 1881, 1891, and 1900, with, in each case, the increase or decrease between 1881 and 1900.

As the holdings not exceeding 1 acre consist to a large extent merely of small gardens, the increase in their number cannot be regarded as a very important factor in an agricultural estimate. As regards other holdings, the general tendency has been for those between 1 acre and 30 acres to decrease, and for those over 30 acres to increase. So far as the first class is concerned, this applies to all the provinces without exception. But as regards the second class, while there was an increase between 1881 and 1900 in holdings over 30 acres in Munster of 1120, in Ulster of 1959, and in Connaught of 1605,

Ireland	1881	49,955	60,268	147,796	122,624	65,617	51,483	20,914	8698	2329	529,684
	1900	71,103	56,652	139,834	121,355	67,785	54,082	22,618	8939	2191	544,559
Increase or decrease		+21,148	−3,616	−7,962	−1,269	+2,168	+2,599	+1,704	+241	−138	+14,875

From the above it is seen that, as might have been expected from the previous table, the occupiers of holdings not exceeding 1 acre largely increased; those occupying holdings between 1 acre and 30 acres decreased (by 12,847), and occupiers of holdings over 30 acres increased (by 6574).

The following table gives in statute acres the distribution of land during 1900 in the various counties, alphabetically arranged under their provinces. The totals for the provinces and for all Ireland are collected into a separate table for the purpose of comparison with the figures for 1881; in this table, below the acreage occupied by each kind of land, is given the percentage it forms of the whole province or county as the case may be.

From the table it will be seen that between 1881 and 1900 the area under crops, including meadow and clover, decreased by 536,643 acres. Each of the four provinces showed a decline, the largest—184,742 acres—being in Ulster, and the smallest—81,105 acres—in Connaught. On the other hand, the area under grass (pasture) increased by 487,948 acres. Each of the four provinces showed an increase, the largest—212,846 acres—being in Ulster, and the smallest—18,919 acres—in Munster. Taking the areas under crops and grass (pasture) together, we find that the total number of acres in use for agricultural purposes decreased by 48,695 acres. Owing, however, to a more than proportionate decline in the population, the census returns of 1881 and 1891 show that the average number of acres of arable and pasture land to each person of the rural population was 3·5 in the former year and 3·9 in the latter year. Turning to the other headings, it will be seen that "woods and plantations" declined by 17,055 acres, but the decrease is to a large extent more apparent than real, as a stricter method of enumeration was adopted in 1891. "Bog and marsh" showed a decline of 142,035 acres, which would seem to point to a considerable reclamation of land. As has been seen from the figures given above, large sums of money have been advanced to tenants for the purpose of draining. In 1900

five counties had over 100,000 acres of bog and marsh—Mayo, 322,688; Galway, 196,801; Donegal, 131,079; King's County, 110,903; and Kerry, 102,223. On the other hand, "barren mountain land" showed an increase of 115,081 acres. The explanation of this increase probably lies in the fact that between 1841 and 1871 over 2,000,000 acres of waste land were reclaimed, or, at all events, brought into agricultural use, and that since 1871, with a steadily declining population, a portion of this reclaimed land has proved to be useless either for grazing or cultivation.

The returns for the whole of Ireland, showing the extent in statute acres under each of the *principal* crops, the percentages—these are of the area under *all* crops—the average yield per acre, and the total produce for a series of years, are given in the table on the following page.

The area under green crops fell from 1,270,026 acres in 1881, or 24·5 of the total extent under crops, to 1,098,377 acres in 1900, or 23·6 of the total extent, a decline of 171,649 acres. The decline was almost entirely due to the large fall in the area under potatoes, for turnips, mangel and beet, and cabbage all exhibited an increase, while vetch and rape only fell from 0·3 per cent. to 0·2 per cent., and the percentage of other green crops remained the same. The decline in potatoes is no doubt largely due to the fact that in the interval a large proportion of that part of the population whose staple food is the potato had left the country. But considering the existence of the linen industry, the most remarkable decline during the period under review was in flax, which decreased by about 100,000 acres. As was to be expected, the number of scutching-mills also decreased from 1172 in 1881 to 815 in 1900, of which 804 were in Ulster. Efforts are at present being made in the north of Ireland, to which the growing of flax is practically confined, to restore and improve its cultivation, but in face of the competition from foreign countries, especially Belgium, it is very

[1] Including 129,681 acres under water.

[2] Exclusive of 492,252 acres under the large rivers, lakes, and tideways.

[3] The difference between the total areas for 1881 and 1900 is owing to the adoption in 1891 of revised areas for certain counties, and the inclusion of some slob lands in the county of Wexford.

doubtful whether the flax-bearing area will ever be raised to its former proportions. The total extent of land under cereals, green crops, and flax thus showed a decrease during the twenty years of 701,329 acres, or 21·2 per cent. The extent of land under meadow and clover, or hay, increasing, on the other hand, by 164,686 acres, the total decline was brought down to 536,643 acres as originally stated. Of the 2,165,715 acres returned in 1900 as under hay, 590,753 were in Leinster, 663,536 in Munster, 592,923 in Ulster, and 318,503 in Connaught, the first-mentioned province being the only one in which a falling-off was exhibited. The total value of the cereal and other crops in 1900 was estimated at £34,230,892. The decrease of 536,643 acres was largely balanced by the increase of 487,948 acres in the area under pasture. Thus, with the exception of 48,695 acres, all the land that was withdrawn in the interval from the cultivation of cereal and green crops appears to have been devoted to the raising of live stock, which it will now be shown did indeed largely increase in quantity between 1881 and 1900.

Crops and Pasture.—As has been already stated, the extent of land under crops, including meadow and clover, decreased by 536,643 acres between the years 1881 and 1900. The chief decline was in cereals, which fell from 1,777,175 acres, or 34·2 per cent. of the total area under crops, to 1,347,189 acres, or 28·9 of the total area under crops. The only cereal crop which showed an increase was rye, and the total acreage of that was very small. The acreage of beans and pease decreased from 11,914 acres to 2738 acres. The several acreages covered by wheat, oats, and barley in 1900 were thus distributed among the provinces:—

Province.	Wheat.	Oats.	Barley.
Leinster	14,782	245,734	125,063
Munster	15,529	206,765	41,353
Ulster	17,535	535,255	4,384
Connaught	5,975	117,296	3,196

Live Stock.—The following table shows the quantity and description of live stock in each province and all Ireland in 1881, 1891, and 1900:—

Province.		Horses.	Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
Leinster	1881	171,348	8,509	49,504	1,012,421	1,125,690	275,373	65,724	3,409,020
	1891	185,003	8,385	52,845	1,120,110	1,577,676	343,845	81,990	3,660,228
	1900	175,119	8,800	57,245	1,177,968	1,494,127	297,724	65,105	4,218,216
Munster	1881	138,529	9,410	54,476	1,297,805	760,309	402,728	88,563	3,419,029

Connaught	1881	67,665	6,079	59,491	617,883	991,271	168,431	37,589	2,558,598
	1891	71,563	6,650	70,755	688,818	1,339,478	205,569	55,776	2,814,850
	1900	65,736	6,945	74,021	713,966	1,297,986	242,290	52,612	3,296,233
Ireland	1881	548,374	26,392	187,143	3,956,595	3,256,185	1,095,830	266,078	13,972,426
	1891	592,819	28,660	216,268	4,448,511	4,722,618	1,367,712	336,337	15,276,128
	1900	566,978	30,678	242,247	4,608,550	4,386,876	1,268,521	306,078	18,547,307

In 1900 the number of cattle was 101,093 higher than in the previous year, and formed the highest total ever recorded in the agricultural statistics; the number of sheep was 66,422 higher than the average of the preceding ten years, though lower than the figures for 1890, 1891, 1892, and 1893. Taking for purposes of comparison three sheep as equal to one head of cattle, the total increase in the twenty years amounted to 1,028,852 head, or 20·4 per cent., as compared with an increase of only 4·8 per cent. in the extent of pasture. To put the comparison in a different way, in 1881 the average number of acres to one head of cattle was 2·0; in 1900 it was 1·7. Although there have been variations in intervening years, it will be seen that between 1881 and 1900 the increase in cattle and sheep was shared by all the four provinces. The total value of horses, cattle, sheep, and pigs in 1900 was

estimated as £81,159,732. The figures respecting the number of horses used for agricultural purposes, the number of milch cows, and the number of ewes were thus returned in 1881 and 1900 :—

		Leinster	Munster	Ulster.	Con-naught.	Ireland.
Horses used in agriculture	1881 .	103,702	92,846	136,398	42,433	375,379
	1900 .	99,469	92,133	135,838	42,245	369,685
Milch cows .	1881 .	227,690	532,475	423,157	188,690	1,372,012
	1900 .	230,966	577,578	444,808	204,727	1,458,074
Ewes .	1881 .	453,902	329,714	167,351	386,904	1,337,871
	1900 .	602,326	396,359	284,493	514,900	1,798,078

It will be observed that there is a general decrease in the number of horses used in agriculture. For the exports of cattle, &c., to Great Britain, see *Shipping* and *Commerce*, below.

Dairy Industries.—In consequence of the growing importance of the dairy industries in Ireland, statistics bearing on the subject have been embodied in the agricultural reports in recent years. In 1891 the number of factories for which returns were made was 152 (107 in Munster, 35 in Leinster, 6 in Ulster, and 4 in Connaught), 129 of which were worked by steam power, and the number of hands permanently employed amounted to 1213. The quantity of butter produced during the year ending 30th September 1891 was 121,309 cwts., and of cheese 1048 cwts., while the number of cans of condensed milk amounted to 8,646,173. In 1900 the number of factories had risen to 506—333 in Munster, 52 in Leinster, 92 in Ulster, and 29 in Connaught—and the number of hands permanently employed to 3656 (190 factories belonged to co-operative societies; see below). There were 985 milk-separators in the factories, of which 889 were worked by steam power. During the year ending 30th September 1900, 401,490 cwts. of butter and 439 cwts. of cheese were produced.

Agricultural Co-operation.—In 1894 the efforts of a number of Irishmen, drawn from all political parties, were successfully directed towards the formation of the Irish Agricultural Organization Society, which has for its object the organizing of groups of farmers on co-operative principles, and the provision of instruction in proper technical methods. The society had at first many difficulties to confront, but after the first two or three years of its existence its progress became more rapid. The chief success of the movement has lain in the direction of co-operative dairy societies. For the year 1900, 171 of these societies made complete returns, from which it appears that they received over 35½ millions of gallons of milk at an average price to the suppliers of 3⅜d. a gallon, from which were produced over 13½ million lb of butter, realizing an average of 10·84d. per lb. Milk payments absorbed £570,075, and working expenses amounted to £74,259; the amount realized by sales was £703,826. A net profit of £12,472 was earned on the year's trading. The Organization Society also aims at the establishment of agricultural societies, agricultural banks, and home industries societies. The following is a provincial summary showing the number of the various societies and the membership on 31st December 1900 :—

Description of Society.	Leinster.		Munster.		Ulster.		Connaught.		Total.

Fisheries.—A number of Acts were passed during the last twenty years of the 19th century with a view of promoting the fishing industry in Ireland. In 1882 the Commissioners of Public Works were given further powers under the Irish Reproductive Loan Fund Act, 1874, to lend money to fishermen on the recommendation of the Inspectors of Fisheries. In 1883 the Land Commission were authorized to pay from time to time such sums, not exceeding in all £250,000, as the Commissioners of Public Works might require, for the creation of a Sea Fisheries Fund, such fund to be expended on the construction of piers and harbours. A sum of about £230,000 has been thus expended up to the present time. In 1889 the Inspectors of Fisheries were empowered to prohibit steam trawling within 3 miles of the Irish coast. Specific Acts were also passed in 1884 for the establishment of oyster fisheries, in 1890 for the promotion of pollan fisheries, and in 1898 for the development of mussel fisheries. In accordance with the terms of the Purchase of Land and Congested Districts (Ireland) Act, 1881, a portion of the Sea Fisheries Fund was reserved for administration by the Inspectors of Fisheries in non-congested districts. Of this amount £20,985 was advanced up to 31st December 1898, the repayments amounting to £13,240. The powers and duties of the Inspectors of Fisheries have been transferred to the Department of Agriculture and Other Industries, which is to apply annually the sum of £10,000 to the promotion of sea fisheries.

In 1900 there were 31 deep-sea and coast fishing districts, in which 6500 vessels with 26,073 hands were engaged, as compared with 5646 vessels with 21,940 hands in 1891, and 6458 vessels with 24,528 hands in 1881. The number of salmon-fishing districts in 1900 was 24, in which 11,366 persons were employed, and the amount of licence duty paid was £9522, as compared with 13,112 persons and £10,543 in 1897, and 13,179 persons and £10,448 in 1895. At the end of 1900 the number of licences in operation for oyster-beds was 62; the estimated value of the catch of shell-fish in the same year was £61,426.

Manufactures, &c.—The linen industry is still practically confined to the north-east portion of Ireland. It cannot be said that the

Years.	In Working Factories.	In Closed Factories.	Total.
1880	839,191	43,884	883,075
1885	810,456	63,454	873,910
1890	815,685	11,766	827,451
1895	849,410	...	849,410
1900	827,882	10,700	838,582

trade has undergone much alteration since 1881. There have naturally been fluctuations—some years bad and some good—but, as will be seen from the foregoing table, the number of spindles in factories actively at work in 1900 was very much the same as in 1881. The power-looms in separate factories, however, considerably increased in number :—

Years.	Attached to Mills.	In Separate Factories.	Total.
1880	10,283	10,894	21,177
1885	11,103	13,197	24,300
1890	10,270	16,322	26,592
1900	8,941	23,304	32,245

The statistics relating to the persons employed were considerably changed in consequence of the Act of 1895, which requires an annual enumeration. The tables put the flax, hemp, and jute makers together, and give no separate details. In 1881 the number of persons employed in the flax-mills and factories of Ireland was 61,749, and in 1890, 64,475, while in 1898–99 the number of persons employed in the flax, hemp, and jute trades was returned as 67,957.

From the report of the Chief Inspector of Factories for 1898–99 it appears that in that year in Ireland 809 persons were employed in the cotton industry, 3323 in the wool, worsted, and shoddy industries, 71 in the silk industry, and 602 in the manufacture of hosiery. The total number of textile factories or departments was 553, employing 72,762 persons. The number of persons employed in non-textile factories was 116,317.

Next to linen, the production of alcoholic drinks, in the forms of whisky, porter, ale, and beer, is the most important manufacturing industry in Ireland. Porter, ale, and beer are classed under the general title of "beer" by the Inland Revenue Department. Though the number of distilleries remained practically the same between 1880 and 1900—28 in the former year and 29 in the latter—the production of whisky largely increased, rising from 9,721,000 gallons in 1880 to 14,480,871 gallons in 1900. This large increase, however, does not imply a corresponding increase of the amount consumed by the inhabitants of Ireland, since the quantity consumed as a beverage in Ireland fell from 5,184,953 gallons in 1881 to 4,713,178 gallons in 1900. The increase in the production of whisky between 1880 and 1900 was accompanied by an increase in the production of beer (including ale and porter). In 1880 2,066,000 barrels of beer were brewed, while in 1900 the number of barrels charged with duty was 3,041,009. The net annual amount of excise duties received in Ireland in a series of years is shown in the following table :—

Articles.	1896.	1897.	1898.	1899.	1900.
	£	£	£	£	£
Beer[1]	874,249	873,815	919,359	939,786	983,841
Licences	198,752	200,954	203,596	207,321	209,577
Spirits[1]	4,098,596	4,156,941	4,212,226	4,252,818	4,952,061
Other Articles	479	467	441	419	487
Total	5,172,076	5,232,177	5,335,622	5,400,344	6,145,966

The following table gives the number and tonnage of the vessels built in Ireland (exclusive of those for foreign firms) in various years since 1881. Since that year shipbuilding in Ireland has largely increased.

Year.	Sailing.		Steam.	
	No.	Net Tonnage.	No.	Net Tonnage.
1881	2	199	12	13,694
1886	11	8,929	10	9,863
1891	17	22,331	20	49,312
1896	4	2,528	12	40,033
1898	13	239	17	68,284
1899	12	669	16	78,273
1900	8	361	21	94,666

This increase, however, has not been due to any wide extension of the industry, but solely to the growth of two Belfast firms. In the five years 1895–99, 97 vessels of 579,467 gross tonnage were launched at Belfast, including the *Oceanic* passenger steamer—the largest vessel then afloat.

Commerce.—The export of animals to Great Britain is the most important department of Irish trade. The following table, giving the number of cattle, sheep, and swine exported in various years between 1881 and 1900, shows how much the trade has grown in that time :—

Years.	Cattle.	Sheep.	Swine.	Total.
1881	571,557	577,627	382,995	1,532,179
1886	717,389	734,213	421,285	1,872,887
1891	630,802	893,175	505,584	2,029,561
1896	681,560	737,306	610,589	2,029,455
1900	745,519	862,263	715,202	2,322,984

In 1891 the number of horses exported to Great Britain was 33,396 ; in 1900, 35,606.

The quantity and value at fixed prices of the fish exported annually to the principal English markets from 1895 to 1899 were thus returned :—

Years.	Salmon.		Herrings		Mackerel.		Cod.		Total Value Exported.
	Boxes 150 lb each.	Value 1s. 3d. a lb.	Boxes 2 cwt. each.	Value £2 a Box.	Boxes 2 cwt. each.	Value 21s. a Box.	Boxes 2 cwt. each.	Value £3 a Box.	
		£		£		£		£	£
1895	61,315	574,828	69,638	139,276	88,585	93,014	42,555	127,665	934,783
1896	61,343	575,091	72,880	145,760	91,026	95,577	43,152	129,456	945,884
1897	55,635	522,047	74,085	148,170	95,495	100,270	44,041	132,123	902,610
1898	52,317	490,473	67,901	135,802	85,714	90.000	40,438	121,314	837,589
1899	54,676	512,587	69,259	138,518	90,446	94,968	40,209	120,627	866,700

The average annual export of linen yarns from Belfast, which is the headquarters of the industry, and provides employment for some 40,000 workers, during the ten years ending 1900, was 19,750,304 lb, with a value exceeding £1,000,000. Other statistics can be given only for the United Kingdom, and the following table shows the amount and value in various years of imports of flax and tow thereinto, and exports of linen yarns and manufactures therefrom, between 1889 and 1900 :—

Years	Imports of Flax and Tow.		Exports of Linen Yarns and Manufactures.							Total Value of Exports £.
	Tons.	Value £.	Yarns lb.	Value £.	Piece Goods yds.	Value £.	Thread lb.	Value £	Unenumerated. Value £.	
1889	89,153	3,066,328	13,944,700	849,263	180,630,200	4,309,980	2,800,200	365,080	1,102,405	6,626,728
1892	86,655	2,743,305	15,460,600	890,142	171,302,500	3,882,650	2,548,400	309,613	973,639	6,056,044
1895	102,622	3,270,840	17,045,600	965,926	203,587,600	4,080,261	2,401,500	263,947	1,006.817	6,316,951
1900	71,586	2,509,810	16,347,100	934,201	154,708,200	3,851,615	1,838,100	237,154	1,135,825	6,158,795

The following returns show the total annual value of imports from foreign countries and British possessions, and exports to foreign countries and British possessions, for a series of years between 1886 and 1900 :—

Year.	Total Imports.	Exports.		
		Declared Value, British and Irish Produce and Manufactures.	Computed Real Value, Foreign and Colonial Merchandise.	Total Value.
	£	£	£	£
1886	6,802,638	815,996	9,183	825,179
1891	9,868,973	253,799	8,469	262,268
1896	9,366,485	235,276	80,966	316,242
1900	12,014,597	344,328	967,720	1,312,048

It will be seen that the imports increased by over £5,000,000, and that the exports, as the result of the creation of a flourishing trade in foreign and colonial merchandise, also increased, although there was a fall of about 60 per cent. in the value of the exports of British and Irish goods.

Shipping.—The number of steam vessels registered at Irish ports considerably increased between the years 1881 and 1900. The returns at intervals of five years from 1881 are given in the following table :—

Year.	Under 50 Tons.		Above 50 Tons.	
	No.	Ton.	No.	Ton.
1881	78	1770	175	59,062
1886	73	1555	196	82,101
1891	65	1414	218	122,121
1896	73	1575	249	150,278
1900	90	1927	267	192,548

The following tables give for a series of years (1) the number and tonnage of vessels that entered and cleared with cargoes in the coasting trade ; (2) the same for those engaged in the foreign trade ; and (3) the totals for both trades. Repeated voyages are included.

Coasting Trade.

Year.	Entered.				Cleared.			
	Sailing.		Steam.		Sailing.		Steam.	
	No.	Ton.	No.	Ton.	No.	Ton.	No.	Ton.
1886	10,334	991,132	16,399	4,202,214	4432	378,698	12,203	3,512,697
1891	8,568	740,511	18,835	4,765,994	4666	345,057	13,054	3,795,488
1896	6,391	482,176	22,171	5,199,860	3686	249,793	14,680	4,098,028
1900	4,708	344,587	22,763	5,129,571	3343	245,057	15,423	4,156,004

Foreign Trade.

Year.	Entered.				Cleared.			
	British.		Foreign.		British.		Foreign.	
	No.	Ton.	No.	Ton.	No.	Ton.	No.	Ton.
1886	769	550,403	381	192,462	113	42,594	23	12,201
1891	813	617,366	346	189,392	91	38,980	12	7,013
1896	829	751,496	357	208,066	143	54,083	8	5,015
1900	780	856,407	256	173,383	135	69,300	5	5,389

[1] After deducting portion of beer duty (3d. per barrel) and additional duty on spirits (6d. per gallon), surrendered to local taxation. In 1899–1900 the amount of beer duty so surrendered was £41,150, and of spirit duty £87,101.

Coasting and Foreign Trade.

Year.	Entered.				Cleared.			
	British.		Foreign.		British.		Foreign.	
	No.	Ton.	No.	Ton.	No.	Ton.	No.	Ton.
1886	27,482	5,737,428	401	198,783	16,717	3,921,522	54	24,668
1891	28,189	6,117,819	373	195,444	17,791	4,176,761	32	9,777
1896	29,376	6,429,474	372	212,129	18,490	4,396,356	27	10,563
1900	28,232	6,325,173	275	178,775	18,887	4,467,434	19	8,316

The number and tonnage of vessels engaged in trade between Great Britain and Ireland were thus returned in various years between 1881 and 1900:—

Year.	Entered and Cleared.			
	British.		Foreign.	
	No.	Ton.	No.	Ton.
1881	82,816	18,114,334	78	23,624
1886	79,061	17,484,389	90	34,614
1891	81,959	18,808,017	87	15,923
1896	83,481	19,370,658	55	15,706
1900	81,235	18,430,729	55	12,762

Railways.—The total amount of capital and loans authorized by Parliament for all classes of railways up to 31st December 1900 was £45,293,090. The paid-up capital (including that raised by loans and debentures) in 1890 was £36,269,000; and in 1900, £39,765,573. Some eighteen short lines, with a total mileage in 1898 of 229 miles, have been authorized at different times under the Tramways (Ireland) Acts, 1860 to 1883. In 1889 an Act was passed to facilitate the construction of light railways in Ireland, and further enactments were made with the same object in 1890 and 1896. Under these Acts fourteen lines, with a mileage of nearly 300 miles, had been constructed up to 1898, principally in the more backward districts of the west, from Donegal to Kerry. The total length of lines open, the passenger traffic, and the total receipts are severally shown below at intervals of five years from 1881:—

Years.	Length of Lines open.	Passengers (exclusive of Season-Ticket Holders).				Receipts.		
		1st Class.	2nd Class.	3rd Class.	Total.	Passenger Traffic.	Goods Traffic.	Total.
						£	£	£
1881	2441	1,675,876	4,021,240	11,946,144	17,643,260	1,425,284	1,176,193	2,601,477
1886	2632	1,384,682	4,034,745	13,300,868	18,720,295	1,482,538	1,270,145	2,752,683
1891	2863	1,512,544	4,196,426	16,493,288	22,202,258	1,696,082	1,463,125	3,159,207
1896	3178	1,628,977	4,384,517	20,551,776	26,565,270	1,858,653	1,555,067	3,413,720
1900	3183	1,496,145	3,927,553	22,226,117	27,649,815	2,034,717	1,698,909	3,733,626

Reference has been made throughout to various official and semi-official publications such as the *Census Reports* (1881, 1891, and 1901), *Agricultural Returns*, *Reports of the Registrar-General*, *Reports of the Congested Districts Board*, *Reports of the Irish Agricultural Organization Society*, *Board of Trade Returns*, *Annual Reports of the Flax Supply Association* and of other local bodies. THOM'S *Official Almanac* contains a useful summary of official statistics. For further information upon the economic and industrial condition of Ireland reference may be made to the following:—GRIMSHAW (late Registrar-General), *Facts and Figures about Ireland*, London, 1893; DENNIS, *Industrial Ireland*, London, 1887; *The Report of the Recess Committee of 1896*. The latter was published in Dublin, and is now very difficult to procure. See also *Report of the Financial Relations Commission*, 1897.

(W. H. Po.)

HISTORY SINCE 1879.

During the last twenty years of the 19th century Irish history was chiefly concerned with the two questions of the land and legislative independence. Isaac Butt (*q.v.*) died in May 1879. He had led a parliamentary party of fifty-four, but the Conservatives had been strong enough to outvote them and the Liberals together. His procedure was essentially lawyer-like, for he respected the House of Commons and dreaded revolutionary violence. His death left the field clear for younger and bolder men. W. Shaw succeeded him as chairman of the Irish party in Parliament; but after the election of 1880, Parnell (*q.v.*), who had the Land League at his back, ousted him by 23 votes to 18.

The Land Law of 1860, known as Deasy's Act, was based on the principle that every tenancy rested on contract either expressed or implied. The Act of 1870, admitting the divergence between theory and practice, protected the tenants' improvements and provided compensation for disturbance within certain limits, but not where the ejectment was for non-payment of rent. In good times this worked well enough, but foreign competition began to tell, and 1879 was the worst of several bad seasons. A succession of wet summers told against all farmers, and in mountainous districts it was difficult to dry the turf on which the people depended for fuel. A famine was feared, and in the west there was much real distress. The Land League, of which Michael Davitt was the founder, originated in Mayo in August, and at a meeting in Dublin in October the organization was extended to all Ireland, with Parnell as president. The country was thickly covered with branches before the end of the year, and in December Parnell went to America to collect money. He was absent just three months, visiting over sixty cities and towns; and 200,000 dollars were subscribed. Parnell had to conciliate the Clan-na-Gael and the Fenians generally, both in Ireland and America, while abstaining from action which would make his parliamentary position untenable. He did not deny that he would like an armed rebellion, but acknowledged that it was an impossibility. Speaking at Cincinnati on 23rd February 1880, he declared that the first thing necessary was to undermine English power by destroying the Irish landlords. Ireland might thus become independent. "And let us not forget," he added, "that that is the ultimate goal at which all we Irishmen aim. None of us, whether we be in America or in Ireland, or wherever we may be, will be satisfied until we have destroyed the last link which keeps Ireland bound to England." At Galway in October of the same year he said that he "would not have taken off his coat" to help the tenant farmers had he not known that that was the way to legislative independence. Fenianism and agrarianism, essentially different as they are, might be worked to the same end.

The Land League.

To meet the partial failure of the potatoes in Connaught and Donegal, very large sums were subscribed and administered by two committees, one under the duchess of Marlborough and the other under the lord mayor of Dublin. When Lord Beaconsfield appealed to the country in March 1880, he reminded the country in a letter to the Viceroy, the duke of Marlborough, that there was a party in Ireland "attempting to sever the constitutional tie which unites it to Great Britain in that bond which has favoured the power and prosperity of both," and that such an agitation might in the end be "scarcely less disastrous than pestilence and famine." But the general election did not turn mainly upon Ireland, and the result gave Gladstone a majority of 50 over Conservatives and Home Rulers combined. Lord Cowper became lord-lieutenant, with W. E. Forster as chief secretary, and Parnell remained chairman of his own party in Parliament. The Compensation for Disturbance Bill, even where the ejectment was for non-payment of rent, passed the House of Commons, but the Lords threw it out, and this has often been represented as the great cause of future trouble. Probably it made little real difference, for the extreme party in Ireland were resolved to stop at nothing. It is not easy to defend the principle that a landlord who has already lost his rent should also have to pay the defaulter

before getting a new tenant or deriving a profit from the farm by working it himself. Speaking at Ennis on 19th September, Parnell told the people to punish a man for taking a farm from which another had been evicted "by isolating him from his kind as if he was a leper of old." The advice was at once taken and its scope largely extended. For refusing to receive rents at figures fixed by the tenants, Captain Boycott, Lord Erne's agent in Mayo, was severely "boycotted," the name of the first victim being given to the new system. His servants were forced to leave him, his crops were left unsaved, even the post and telegraph were interfered with. The Ulster Orangemen resolved to get in the crops, and to go in armed force sufficient for the purpose. The Government had to let 50 of them go under the protection of about 900 soldiers. The cost seemed great, but the work was done and the law vindicated. In Cork Mr Bence-Jones was attacked. The men in the service of the steam-packet companies refused to put his cattle on board, and they were eventually smuggled across the Channel in small lots. Several associations were formed which had more or less success against the League, and at last a direct attack was made. Parnell with four other members of Parliament and the chief officers of the Land League were indicted for conspiracy in the Queen's Bench. No means of intimidating the jurors was neglected, and in the then state of public feeling a verdict was hardly to be expected. On 25th January 1881 the jury disagreed, and Parnell became stronger than ever.

Boycotting.

Then followed a reign of terror which lasted for years. No one was safe, and private spite worked freely in the name of freedom. The system originated by Parnell's Ennis speech became an all-devouring tyranny. In the House of Commons, on 24th May 1882, Gladstone said that boycotting required a sanction like every other creed, and that the sanction which alone made it effective "is the murder which is not to be denounced." The following description by a resident in Munster was published in *The Times* of 5th November 1885 :—"Boycotting means that a peaceable subject of the Queen is denied food and drink, and that he is ruined in his business; that his cattle are unsaleable at fairs; that the smith will not shoe his horse, nor the carpenter mend his cart; that old friends pass him by on the other side, making the sign of the Cross; that his children are hooted at the village school; that he sits apart like an outcast in his usual place of public worship: all for doing nothing but what the law says he has a perfect right to do. I know of a man who is afraid to visit his own son. A trader who is even suspected of dealing with such a victim of tyranny may be ruined by the mere imputation; his customers shun him from fear, and he is obliged to get a character from some notorious leaguer. Membership of the National League is, in many cases, as necessary a protection as ever was a certificate of civism under Robespierre. The real Jacobins are few, but the masses groan and submit." Medicine was refused by a shopkeeper even for the sick child of a boycotted person. A clergyman was threatened for visiting a parishioner who was under the ban of the League. Sometimes no one could be found to dig a grave. The League interfered in every relation of life, and the mere fact of not belonging to it was often severely punished. "The people," says the report of the Cowper Commission, "are more afraid of boycotting, which depends for its success on the probability of outrage, than they are of the judgments of the courts of justice. This unwritten law in some districts is supreme."

The session of 1881 was chiefly occupied with Ireland. "With fatal and painful precision," Gladstone told the House of Commons on 28th January, "the steps of crime dogged the steps of the Land League," and the first thing was to restore the supremacy of the law. In 1871 there had been an agrarian war in Westmeath, and an Act had been passed authorizing the arrest of suspected persons and their detention without trial. The ringleaders disappeared and the county became quiet again. It was now proposed to do the same thing for the whole of Ireland, the power of detention to continue until 30th September 1882. Parnell cared nothing for the dignity of the House of Commons. His leading idea was that no concession could be got from England by fair means, and he made himself as disagreeable as possible. Parliamentary forms were used with great success to obstruct parliamentary action. The "Coercion Bill" was introduced on 24th January. There was a sitting of 22 hours and another of 41 hours, and on 2nd February the debate was closured by the Speaker on his own responsibility and the Bill read a first time. The Speaker's action was approved by the House generally, but acrimonious debates were raised by Irish members. Parnell and 35 of his colleagues were suspended, and the Bill became law on 2nd March, but not before great and permanent changes were made in parliamentary procedure. An Arms Bill, which excited the same sort of opposition, was also passed into law.

Coercion.

That a Land Act should be passed was a foregone conclusion as soon as the result of the general election was known. There were many drafts and plans which never saw the light, but it was at last resolved to adopt the policy known as the "Three F's"—free sale, fixity of tenure, and fair rents. By the first tenants at will were empowered to sell their occupation interests, the landlord retaining a right of pre-emption. By the second the tenant was secured from eviction except for non-payment of rent. By the third the tenant was given the right to have a "fair rent" fixed by a newly formed Land Commission Court, the element of competition being entirely excluded. There were several exceptions and qualifying clauses, but most of them have been swept away by later Acts. The Act of 1881 can scarcely be said to have worked well or smoothly, but it is not easy to see how any sort of settlement could have been reached without accepting the principle of having the rent fixed by a third party. Drastic as the Bill was, Parnell refused to be a party to it, and on the second reading, which was carried by 352 to 176, he walked out of the House with 35 of his followers. When the Bill became law in August he could not prevent the tenants from using it, but he did what he could to discourage them in order to please his American paymasters, who repudiated all parliamentary remedies. In September a convention was held in Dublin, and Parnell reported its action to the American Land League :—"Resolutions were adopted for national self-government, the unconditional liberation of the land for the people, tenants not to use the rent-fixing clauses of the Land Act, but follow old Land League lines, and rely on the old methods to reach justice. The executive of the League is empowered to select test cases, in order that tenants in surrounding districts may realize, by the results of cases decided, the hollowness of the Act" (Barry O'Brien, *Life of C. S. Parnell*, i. 306). His organ *United Ireland* declared that the new courts must be cowed into giving satisfactory decisions. The League, however, could not prevent the farmers from using the fair-rent clauses. It was more successful in preventing free sale, maintaining the doctrine that, rent or no rent, no evictions were to be allowed. At the first sitting of the Land Commission in Dublin the crier, perhaps by accident, declared "the court of the Land League to be open." Speaking at Leeds on

Land Act, 1881.

7th October, Gladstone said "the resources of civilization were not exhausted," adding that Parnell "stood between the living and the dead, not like Aaron to stay the plague, but to spread the plague." Two days later Parnell called the prime minister a "masquerading knight-errant," ready to oppress the unarmed, but submissive to the Boers as soon as he found "that they were able to shoot straighter than his own soldiers." Four days after this Parnell was arrested under the Coercion Act and lodged in Kilmainham gaol. The Land League having retorted by ordering the tenants to pay no rent, it was declared illegal, and suppressed by proclamation. Parnell is said to have disapproved of the no-rent manifesto, as also Mr Dillon, who was in Kilmainham with him, but both of them signed it (*ib.* i. 319). At Liverpool on 27th October Gladstone described Parnell and his party as "marching through rapine to the disintegration and dismemberment of the empire." In 1881, 4439 agrarian outrages were reported; nothing attracted more attention in England than the cruel mutilations of cattle, which became very frequent. The Ladies' Land League tried to carry on the work of the suppressed organization, and there was even an attempt at a Children's League. Sex had no effect in softening the prevalent style of oratory, but the Government thought it better to take no notice. The imprisonment of suspects under the Coercion Act had not the expected result, and outrages were incessant, the agitation being supported by constant supplies of money from America. Gladstone resolved on a complete change of policy. It was decided to check evictions by an Arrears Bill, and the three imprisoned members of Parliament—Messrs Parnell, Dillon, and O'Kelly—were released on 2nd May 1882, against the wishes of the Irish Government. This was known as the Kilmainham Treaty. Lord Cowper and Forster at once resigned, and were succeeded by Lord Spencer and Lord Frederick Cavendish, who entered Dublin on 6th May.

Kilmainham "Treaty."

That same evening Lord Frederick and the permanent under-secretary Thomas H. Burke were murdered in the Phœnix Park in broad daylight, under the new lord-lieutenant's windows. The weapons were amputating knives imported for the purpose. The assassins drove rapidly away; no one, not even those who saw the deed from a distance, knew what had been done. A Dublin tradesman named Field, who had been a juror in a murder trial, was attacked by the same gang and stabbed in many places. He escaped with life, though with shattered health, and it was the identification of the man who drove his assailants' car that afterwards led to the discovery of the whole conspiracy. The clue was obtained by a private examination of suspected persons under the powers given by the Crimes Act. To obtain convictions the evidence of an informer was wanted, and the person selected was James Carey, a member of the Dublin Corporation and a chief contriver of the murders. He swore that they had been ordered immediately after the appearance of an article in the *Freeman's Journal* which declared that a "clean sweep" should be made of Dublin Castle officials. The evidence disclosed the fact that several abortive attempts had been previously made to murder Forster. Out of twenty persons subsequently arraigned, five were hanged, and others sentenced to long terms of imprisonment. Carey embarked for South Africa in the following July, and was murdered on board ship by Patrick O'Donnell, who was brought to England, convicted, and hanged on 17th December 1883.

Phœnix Park murders.

Mr G. O. Trevelyan had been appointed chief secretary in May 1882, and in July the Crimes Prevention Act was passed for three years on lines indicated by Lord Cowper. In the first six months of the year 2597 agrarian outrages were reported, and in the last six months 836. They fell to 834 in 1883, and to 744 in 1884. The Arrears Bill also became law. Money enough was advanced out of the surplus property of the Irish Church to pay for tenants of holdings under £30 one year's rent upon all arrears accruing before November 1880, giving them a clear receipt to that date on condition of their paying another year themselves; of the many reasons against the measure the most important was that it was a concession to agrarian violence. But the same could be and was said of the Land Act of 1881. That had been passed, and it was probably impossible to make it work at all smoothly without checking evictions by dealing with old arrears. The Irish National League was, however, founded in October to take up the work of the defunct Land League, and the country continued to be disturbed. The law was paralysed, for no jury could be trusted to convict even on the clearest evidence, and the National League branches assumed judicial functions. Men were openly tried all over the country for disobeying the revolutionary decrees, and private spite was often the cause of their being accused. "Tenants," to quote the Cowper Commission again, "who have paid even the judicial rents have been summoned to appear before self-constituted tribunals, and if they failed to do so, or on appearing failed to satisfy those tribunals, have been fined or boycotted." In February 1883 Mr Trevelyan gave an account of his stewardship at Hawick, and said that all law-abiding Irishmen, whether Conservative or Liberal, were on one side, while on the other were those who "planned and executed the Galway and Dublin murders, the boycotting and firing into houses, the mutilation of cattle, and intimidation of every sort." In this year the campaign of outrage in Ireland was reinforced by one of dynamite in Great Britain. The home secretary, Sir W. Harcourt, brought in an Explosives Bill on 9th April, which was passed through all its stages in one day and received the royal assent on the next. The dynamiters were for the most part Irish-Americans, who for obvious reasons generally spared Ireland, but one land-agent's house in Kerry was shaken to its foundations in November 1884. At Belfast in the preceding June Lord Spencer, who afterwards became a Home Ruler, had announced that the secret conspirators would "not terrify the English nation." On 22nd February 1883 Forster made his great attack on Parnell in the House of Commons, accusing him of moral complicity with Irish crime. A detailed answer was never attempted, and public attention was soon drawn to the trial of the "Invincibles" who contrived the Phœnix Park murders. On the 11th of December Parnell received a present of £37,000 from his followers in Ireland. The tribute, as it was called, was raised in spite of a papal prohibition. As a complement to the Land Act and Arrears Act, boards of guardians were this year empowered to build labourers' cottages with money borrowed on the security of the rates and repayable out of them. Half an acre of land went with the cottage, and by a later Act this was unwisely extended to one acre. That the labourers had been badly housed was evident, and there was little chance of improvement by private capitalists, for cottage property is not remunerative. But the working of the Labourers Acts has been very costly, and cottages are often assigned to people who are not agricultural labourers at all. In many districts the building has been quite overdone, and the rent obtainable being far less than enough to recoup the guardians, the system operates as out-door relief for the able-bodied and as a rate in aid of wages.

National League.

Dynamite.

Labourers Act.

The Explosives Act, strong as it was, did not at once effect its object. In February 1884 there was a plot to blow up four London railway stations by means of clockwork infernal machines containing dynamite, brought from America. Three Irish-Americans were convicted, of whom one, John Daly, who was sentenced to penal servitude for life, lived to be mayor of Limerick in 1899. In January 1885 Parnell visited Thurles, where he gave a remarkable proof of his power by breaking down local opposition to his candidate for Tipperary. In April the prince and princess of Wales visited Ireland. At Dublin they were well received, and at Belfast enthusiastically, but there were hostile demonstrations at Mallow and Cork. In May it was intended to renew the Crimes Prevention Act, but before that was done the Government was beaten on a financial question by 264 to 252, Parnell and 39 of his followers voting with the Conservatives. The Crimes Prevention Act expired on the 12th July, and the want of it was at once felt. The number of agrarian outrages reported in the first six months of the year was 373; in the last six months they rose to 543, and the number of persons boycotted was almost trebled. Lord Salisbury came into office, with Lord Carnarvon as lord-lieutenant and Sir W. Hart Dyke as chief secretary. The lord-lieutenant had an interview with Parnell, of which very conflicting accounts were given, but the Irish leader issued a manifesto advising his friends to vote against the Liberals as oppressors and coercionists, who promised everything and did nothing. The constitutional Liberal party in Ireland was in fact annihilated by the extension of the franchise to agricultural labourers and very small farmers. The most important Irish measure of the session was the Ashbourne Act, by which £5,000,000 was allotted on the security of the land for the creation of an occupying proprietary. Later the same sum was again granted, and there was still a good deal unexpended when the larger measure of 1891 became law. In December, when the general election was over, an anonymous scheme of Home Rule appeared in some newspapers, and in spite of disclaimers it was at once believed that Gladstone had made up his mind to surrender. In October 1884, only fourteen months before, he had told political friends that he had a sneaking regard for Parnell, and that Home Rule might be a matter for serious consideration within ten years (Sir A. West's *Recollections*, 1899, ii. 206). The shortening of the time was perhaps accounted for by the fact that the new House of Commons consisted of 331 Liberals, 249 Conservatives, 86 Home Rulers and Independents, Parnell thus holding the balance of parties. In Ireland there had been 66 elections contested, and out of 451,000 voters 93,000 were illiterates (Parliamentary Return, 6th May 1886). Such were the constituencies to whom it was proposed to hand Ireland over. On 26th January 1886 the Government were defeated by a combination of Liberals and Nationalists on an issue not directly connected with Ireland, and their resignation immediately followed. Gladstone became prime minister, with Lord Aberdeen as lord-lieutenant and Mr John Morley as chief secretary. Lord Hartington and Mr Goschen were not included in this administration. In February Parnell again showed his power by forcing Captain O'Shea upon the unwilling electors of Galway. He introduced a Land Bill to relieve tenants from legal process if they paid half their rent, and foretold disorder in consequence of its rejection. In April the Government of Ireland Bill was brought in, Mr Chamberlain, Mr Trevelyan, and others leaving the ministry. The bill attempted to safeguard British interests, while leaving Ireland at the mercy of the native politicians. Irish members were excluded from the Imperial Parliament. The local legislature was to consist of two orders sitting and voting together, but with the power of separating on the demand of either order present. The 28 representative peers, with 75 other members having an income of £200, or a capital of £4000, elected for ten years by £25 occupiers, were to constitute the first order. The second was to have 204 members, returned for five years by the usual parliamentary electorate. The status of the lord-lieutenant was unalterable by this legislature. Holders of judicial offices and permanent civil servants had the option of retiring with pensions, but the constabulary, whom the Home Rulers had openly threatened to punish when their time came, were to come after an interval under the power of the Irish Parliament. Parnell accepted the Bill, but without enthusiasm.

Ashbourne Act.

Home Rule Bill, 1886.

The Government of Ireland Bill gave no protection to landowners, but as the crisis was mainly agrarian, it would have been hardly decent to make no show of considering them. A Land Purchase Bill was accordingly introduced on 16th April by the prime minister under "an obligation of honour and policy," to use his own words. Fifty millions sterling in three years was proposed as payment for what had been officially undervalued at 113 millions. It was assumed that there would be a rush to sell, the choice apparently lying between that and confiscation, and priority was to be decided by lot. The Irish landlords, however, showed no disposition to sell their country, and the Purchase Bill was quickly dropped, though Gladstone had declared the two measures to be inseparable. He reminded the landlords that the "sands were running in the hour-glass," but this threat had no effect. The Unionists of Ireland had been taken by surprise, and out of Ulster they had no organization capable of opposing the National League and the Government combined. Individuals went to England and spoke wherever they could get a hearing, but it was uphill work. In Ulster the Orange lodges were always available, and the large Protestant population made itself felt. The police were looked upon as the emissaries of a ministry who had abandoned Ireland to the rebels. Terrible riots took place at Belfast in June, July, and August. In October there was an inquiry by a royal commission with Mr Justice Day at its head, and on the report being published in the following January there were fresh riots. Foolish and criminal as these disturbances were, they served to remind the English people that Ireland would not cease to be troublesome under Home Rule. In Parliament the Home Rule Bill soon got into rough water; John Bright declared against it. The "dissentient Liberals," as Gladstone always called them, were not converted by the abandonment of the Purchase Bill, and on 7th June 93 of them voted against the second reading, which was lost by 30 votes. A general election followed in July, and 74 Liberal Unionists were returned, forming with the Conservatives a Unionist party, which outnumbered Gladstonians and Parnellites together by over a hundred. Gladstone resigned, and Lord Salisbury became prime minister, with Lord Londonderry as lord-lieutenant and Sir M. Hicks-Beach as chief secretary.

The political stroke having failed, agrarianism again occupied the ground. The "plan of campaign" was started, against Parnell's wishes, towards the end of 1886. The gist of this movement was that tenants should offer what they were pleased to consider a fair rent, and if it was refused, should pay the money into the hands of a committee. In March 1887 Sir M. Hicks-Beach resigned on account of illness, and Mr Arthur Balfour became chief secretary. The attempt to govern Ireland under what was called "the ordinary law" was necessarily abandoned, and a

The "plan of campaign."

perpetual Crimes Act was passed which enabled the lord-lieutenant to proclaim disturbed districts and dangerous associations, and substituted trial by magistrates for trial by jury in the case of certain acts of violence. In August the National League was suppressed by proclamation. The conservative instincts of the Vatican were alarmed by the lawless state of Ireland, and an eminent ecclesiastic, Monsignor Persico, arrived in the late summer on a special commission of inquiry. He made no secret of his belief that the establishment of an occupying proprietary was the only lasting cure, but the attitude of the clergy became gradually more moderate. The Government passed a bill giving leaseholders the benefit of the Acts of 1881, and prescribing a temporary reduction upon judicial rents already fixed. This last provision was open to many great and obvious objections, but was more or less justified by the fall in prices which had taken place since 1881.

The steady administration of the Crimes Act by Mr Balfour gradually quieted the country. Parnell had now gained the bulk of the Liberal party, including Lord Spencer (in spite of all that he had said and done) and Sir G. Trevelyan (in spite of his Hawick speech). In the circumstances the best chance for Home Rule was not to stir the land question. Mr Cecil Rhodes, who hoped to help imperial federation by breaking up the United Kingdom, gave Parnell £10,000 for the cause. In September 1887 a riot arising out of the "plan of campaign" took place at Mitchelstown. The police fired, and two lives were lost, Messrs Labouchere, M.P., and Brunner, M.P., being present at the time. The coroner's jury brought in a verdict against the police, but that was a matter of course, and the Government ignored it. A telegram sent by Gladstone a little later, ending with the words "remember Mitchelstown," created a good deal of feeling, but it did the Home Rulers no good. In October Mr Chamberlain visited Ulster, where he was received with enthusiasm, and delivered several stirring Unionist speeches. In November Lord Hartington and Mr Goschen were in Dublin, and addressed a great loyalist meeting there.

Parnell Commission.

In July 1888 an Act was passed appointing a commission, consisting of Lord Justice Hannen, Mr Justice Day, and Mr Justice A. L. Smith, to inquire into certain charges made by *The Times* against Parnell and his party. What caused most excitement was the publication by *The Times* on 15th May 1887 of a *facsimile* letter purporting to have been written by Parnell on 15th May 1882, nine days after the Phœnix Park murders. The writer of this letter suggested that his open condemnation of the murders had been a matter of expediency, and that Mr Burke deserved his fate. Parnell at once declared that this was a forgery, but he did nothing more at the time. Other alleged incriminating letters followed. The case of *O'Donnell* v. *Walter*, tried before the Lord Chief Justice of England in July 1888, brought matters to a head, and the special commission followed. The proceedings were necessarily of enormous length, and the commissioners did not report until 13th February 1890, but the question of the letters was decided just twelve months earlier, Richard Pigott, who shot himself at Madrid, having confessed to the forgeries. A few days later, on 8th March 1889, Parnell was entertained at dinner by the Eighty Club, Lords Spencer and Rosebery being present; and he was well received on English platforms when he chose to appear. Yet the special commission shed a flood of light on the agrarian and Nationalist movement in Ireland. Eight members of Parliament were pronounced by name to have conspired for the total political separation of the two islands. The whole party were proved to have disseminated newspapers tending to incite to sedition and the commission of crime, to have abstained from denouncing the system of intimidation, and to have compensated persons injured in committing crime.

New Tipperary.

The conduct of the agrarian war had in the meantime almost passed from Parnell's hands. The "plan of campaign" was not his work, still less its latest and most remarkable exploit. To punish Mr Smith-Barry for his exertions in favour of a brother landlord, his tenants in Tipperary were ordered to give up their holdings. A sum of £50,000 was collected to build "New Tipperary," and the fine shops and flourishing concerns in the town were deserted to avoid paying small ground-rents. The same course was pursued with the farmers, some of whom had large capitals invested. Mr William O'Brien presided at the inaugural dinner on 12th April, and some English M.P.'s were present, but his chief supporter throughout was Father Humphreys. Parnell was invited, but neither came nor answered. No shopkeeper nor farmer had any quarrel with his landlord. "Heretofore," a tenant wrote in *The Times* in the following December, "people were boycotted for taking farms, I am boycotted for not giving up mine, which I have held for twenty-five years. A neighbour of mine, an Englishman, is undergoing the same treatment, and we alone. We are the only Protestant tenants on the Cashel estate. The remainder of the tenants, about thirty, are clearing everything off their land, and say they will allow themselves to be evicted." In the end the attack on Mr Smith-Barry completely failed, and he took back his misguided tenants. But the town of Tipperary has not recovered its old prosperity.

Land purchase.

The principal Irish measure passed in 1891 was Mr Balfour's Purchase Bill, to extend and modify the operation of the Ashbourne Acts. Thirty millions were provided to convert tenants into proprietors, the instalments paid being again available, so that all the tenanted land in Ireland might ultimately be passed through if desired. The land itself in one shape or another forms the security, and guaranteed stock is issued which the holder may exchange for consols. The 40th clause of the Land Act of 1896 greatly stimulated the creation of occupying owners in the case of over-incumbered estates, but solvent landlords are not in a hurry to sell. The interests of the tenant are so carefully guarded that the prices obtainable are ruinous to the vendor unless he has other resources. The security of the Treasury is also so jealously scrutinized, that even the price which the tenant may be willing to pay is often disallowed. Thus the Land Commission really fixes the price of all property, and the last vestige of free contract is obliterated. Compulsory purchase has become a popular cry, especially in Ulster, and several members of Parliament are pledged to further it. It is certain, however, that owners cannot with any pretence of justice be forced to sell at ruinous prices, nor can tenants be forced to give more than they think fair. If the State, for purposes of its own, insists upon expropriating all landlords, it will have to find the difference, or to enter upon a course of undisguised confiscation. The Purchase Act was not the only one relied on by Mr Balfour. The Light Railways Act passed by him in 1890 has done much to open up some of the poorest parts of the west, and the temporary scarcity of that year was dealt with by relief works.

An action begun by Parnell against *The Times* was settled by the payment of a substantial sum and the withdrawal of the Pigott letters. The Nationalist leader seemed to stand higher than ever, but the writ in the divorce proceedings, brought by Captain O'Shea against his wife, with the Irish leader as co-respondent, was

hanging over him. To public astonishment, when the case came on for trial there was no defence, and on 17th November 1890 a decree *nisi* was granted. Parnell's subsequent marriage with the respondent before a registrar did him no good with his Roman Catholic supporters.

Parnell's downfall. The Irish bishops remained silent, while in England the "Nonconformist conscience" revolted. Three days after the verdict a great meeting was held in the Leinster Hall, Dublin, attended by 25 of the Irish parliamentary party. The result was an enthusiastic vote of confidence in Parnell, moved by Mr Justin M'Carthy and seconded by Mr T. M. Healy. Five days later he was unanimously re-elected chairman by his party in Parliament, but the meeting was scarcely over when Gladstone's famous letter to Mr Morley became public. The writer in effect demanded Parnell's resignation of the leadership as the condition upon which he could continue at the head of the Liberal party. He had to choose between the Nonconformist vote and the Irish leader, and he preferred the former. Next day the secession of the Irish members from their chief began. Long and acrimonious debates followed in committee-room 15, and on 6th December Parnell was left in the chair with only 26 supporters. The majority of 45 members—Anti-Parnellites, as they came to be called—went into another room, unanimously deposed him, and elected Mr Justin M'Carthy in his place. Parnell then began a campaign as hopeless as that of Napoleon after Leipzig. He seized the office of *United Ireland* in person. The Fenian element was with him, as he admitted, but the clergy were against him, and the odds were too great, especially against a Protestant politician. His candidate in a bye-election at Kilkenny was beaten by nearly two to one, and he himself was injured in the eyes by lime being thrown at him. Similar defeats followed at Sligo and Carlow. He went over to France to meet Messrs Dillon and O'Brien, who had not yet taken sides, but nothing was agreed to, and in the end both these former followers went against him. Every Saturday he went from London to Dublin and addressed some Sunday meeting in the country. The last was on 27th September. On 6th October 1891 he died at Brighton, from the effects of a chill following on overwork and excitement. His funeral at Glasnevin was attended by 200,000 people. At the general election of 1892, however, only 9 Parnellites—the section which under Mr John Redmond remained staunch to his memory—were returned to Parliament.

The "Parnellite split," as it was called, proved fatal to the cause of Home Rule, for the Nationalist party broke up into factions. No one of the sectional leaders commanded general confidence, and personal rivalries were of the bitterest kind. An important result of these quarrels was to stop the supply of American money, without which neither the Land League nor the Home Rule agitation could have been worked. The Unionist party had adopted a policy of local government for Ireland while opposing legislative independence, and a bill was introduced into the House of Commons by Mr Balfour in February 1892. The principle was affirmed by a great majority, but the measure could not then be proceeded with. At the general election in July the Gladstonians and Nationalists together obtained a majority of 40 over Conservatives and Liberal Unionists. Lord Salisbury resigned in August, and was succeeded by Gladstone, with Lord Houghton as lord-lieutenant and Mr John Morley as chief secretary. The Crimes Act, which had already been relaxed, was altogether suspended, and the proclamation declaring the National League illegal was revoked. The lord-lieutenant, on taking up his quarters in Dublin, refused a loyal address because of its Unionist tone; and in October the Government issued a commission, with Mr Justice Mathew as chairman, which had the restoration of the evicted tenants as its avowed object. Two of the commissioners very shortly resigned, and the whole inquiry became somewhat farcical. It was given in evidence that out of £234,431 collected under the plan of campaign only £125,000 had been given to evicted tenants. In February 1893, on the application of the sheriff of Kerry, an order from the Castle, refusing protection, was pronounced illegal in the Queen's Bench, and persons issuing it were declared liable to criminal prosecution. In the same month Gladstone introduced his second Home Rule Bill, which proposed to retain 80 Irish members in the Imperial Parliament instead of 103, but they were not to vote on any proceedings expressly confined to Great Britain. On 8th April 1886 he had told the House of Commons that it "passed the wit of man" to draw a practical distinction between imperial and non-imperial affairs. On 20th July 1888 he informed the same assembly that there was no difficulty in doing so. It had become evident, in the meantime, to numberless Englishmen that the exclusion of the Irish members would mean virtual separation. The plan now proposed met with no greater favour, for a good many English Home Rulers had been mainly actuated all along by the wish to get the Irish members out of their way. The financial provisions of the Bill were objected to by the Nationalists as tending to keep Ireland in bondage.

Home Rule Bill, 1893.

During the year 1892 a vast number of Unionist meetings were held throughout Ireland, the most remarkable being the great Ulster convention in Belfast, and that of the three other provinces in Dublin, on the 14th and 23rd of June. On 22nd April 1893, the day after the second reading of the Bill, the Albert Hall in London was filled by enthusiastic Unionist delegates from all parts of Ireland. Next day the visitors were entertained by Lord Salisbury at Hatfield, the duke of Devonshire, Mr Balfour, Mr Goschen, and Mr Chamberlain being present. Between the second reading and the third on 1st September the Government majority fell from 43 to 34. A great part of the Bill was closured by what was known as the device of the "gag" without discussion, although it occupied the House of Commons altogether eighty-two nights. It was thrown out by the Lords by 419 to 41, and the country undoubtedly acquiesced in their action. On 3rd March 1894 Gladstone resigned, and Lord Rosebery became prime minister. A bill to repeal the Crimes Act of 1887 was read a second time in the Commons by 60, but went no farther. A committee on the Irish Land Acts was closured at the end of July by the casting vote of the chairman, Mr Morley, and the minority refused to join in the report. The bill to restore the evicted tenants, which resulted from the Mathew Commission, was rejected in the Lords by 249 to 30. In March 1895 Mr Morley introduced a Land Bill, but the Government majority continued to dwindle. Another Crimes Act Repeal Bill passed the second reading in May by only 222 to 208. In July, however, the Government were defeated on the question of the supply of small-arms ammunition. A general election followed, which resulted in a Unionist majority of 150. The Liberal Unionists, whose extinction had once been so confidently foretold, had increased from 46 to 71, and the Parnellites, in spite of the most violent clerical opposition, from 9 to 12. Lord Cadogan became lord-lieutenant of Ireland, and Mr Gerald Balfour—who announced a policy of "killing Home Rule by kindness" —chief secretary.

In the session of 1896 a new Land Act was added to the statute-book. The general effect was to decide most disputed points in favour of the tenants, and to repeal the

exceptions made by former Acts in the landlord's favour. Dairy farms, to mention only a few of the most important points which had been hitherto excluded, were admitted within the scope of the Land Acts, and purely pastoral holdings of between £50 and £100 were for the first time included. A presumption of law in the tenant's favour was created as to improvements made since 1850. The 40th clause introduced the principle of compulsory sale to the tenants of estates in the hands of receivers. The tendency of this provision to lower the value of all property has been partly, but only partly, neutralized by the firmness of the land judge. The landlords of Ireland, who had made so many sacrifices and worked so hard to return Lord Salisbury to power, felt that the measure was hardly what they had a right to expect from a Unionist administration. In their opinion it unsettled the agricultural mind, and encouraged judicial tenants to go to law at the expiration of the first fifteen years' term instead of bargaining amicably with their landlords.

Land Act, 1896.

In the autumn of this year was published the report of the Royal Commission on the financial relations between England and Ireland. Mr Childers was the original chairman of this commission, which was appointed in 1894 with the object of determining the fiscal contribution of Ireland under Home Rule, and after his death The O'Conor Don presided. The report—or rather the collection of minority reports—gave some countenance to those who held that Ireland was overtaxed, and there was a strong agitation on the subject, in which some Irish Unionists joined without perceiving the danger of treating the two islands as "separate entities." No individual Irishman is taxed on a higher scale than any corresponding citizen of Great Britain. No tax, either on commodities or property, is higher in Ireland than it is in England. The alleged grievance has, however, been exploited to the utmost extent by the Nationalist party. In 1897 a Royal Commission, with Sir Edward Fry as chairman, was appointed to inquire into the operation of the Land Acts. Voluminous evidence was taken in different parts of Ireland, and the commissioners reported in the following year. The methods and procedure of the Land Commission were much criticized, and many recommendations were made, but no legislation followed. This inquiry proved, what few in Ireland doubted, that the prices paid for occupancy interest or tenant right increased as the landlord's rent was cut down.

Financial relations.

The session of 1898 was largely occupied with the discussion of a bill to establish county and district councils on the lines of the English Act of 1888. The fiscal jurisdiction of grand juries, which had lasted for more than two centuries and a half, was entirely swept away. Local government for Ireland had always been part of the Unionist programme, and the vote on the abortive bill of 1892 had committed Parliament to legislation. It may, nevertheless, be doubted whether enough attention was paid to the local peculiarities of Ireland, and whether English precedents were not too closely followed. In Ireland the poor-rate used to be divided between landlord and tenant, except on holdings valued at £4 and under, in which the landlord paid the whole. Councils elected by small farmers were evidently unfit to impose taxes so assessed. The poor-rate and the county cess, which latter was mostly paid by the tenants, were consolidated, and an agricultural grant of £730,000 was voted by Parliament in order to relieve both parties. The consolidated rate is now paid by the occupier, who will profit by economy and lose by extravagance. The towns gained nothing by the agricultural grant, but union rating was established for the first time. The net result of the county council elections in the spring of 1899 was to displace, except in some northern counties, nearly all the men who had hitherto done the local business. Nationalist pledges were exacted, and long service as a grand juror was an almost certain bar to election. The Irish gentry, long excluded, as landlords and Unionists, from political life, now felt to a great extent that they had no field for activity in local affairs. The new councils very generally passed resolutions of sympathy with the Boers in the South African war. The one most often adopted, though sometimes rejected as too mild, was that of the Limerick corporation, hoping "that it may end in another Majuba Hill." Efforts not wholly unsuccessful were made to hinder recruiting in Ireland, and every reverse or repulse of British arms was greeted with Nationalist applause.

Local Government Act, 1898.

The scheme for a Catholic University—of which Mr Arthur Balfour, speaking for himself and not for the Government, made himself a prominent champion—was much canvassed in 1899, but it came to nothing. It must always be very difficult to devise a scheme satisfactory both to Parliament and to the Roman Catholic hierarchy. It has not been forgotten that this question wrecked the Liberal party in 1874.

The chief Irish measure of 1899 was an Agricultural and Technical Instruction Act, which established a new department with the chief secretary at its head and an elaborate system of local committees. Considerable funds were made available, and Mr Horace Plunkett, who as an independent Conservative member had been active in promoting associations for the improvement of Irish methods in this direction, became the first vice-president, retaining his seat in Parliament under the Act. It remains to be seen what can be done in the way of technical instruction in a country where organized industries have hitherto been so few. Probably an attempt will be made to foster manual dexterity in the primary schools, where education has been too exclusively literary. In agriculture, and especially in cattle-breeding, improvement was formerly due mainly to the landlords, who have now been deprived by law of much of their power. The gap may be partly filled by the new department, but progress must be slow. Some experience has been gained not only through the voluntary associations promoted by Mr Plunkett, but also from the Congested Districts Board founded under the Land Purchase Act of 1891. This board has power within the districts affected by it to foster agriculture and fisheries, to enlarge holdings, and to buy and hold land. In March 1899 it had from first to last laid out a little more than half a million. The principal source of income was a charge of £41,250 a year upon the Irish Church surplus, but the establishment expenses were paid by Parliament.

Board of Agriculture.

At the opening of the session in January 1900 there was a formal reconciliation of the Dillonite, Healyite, and Redmondite or Parnellite factions. It was evident from the speeches made on the occasion that there was not much cordiality between the various leaders, but the outward solidarity of the party was calculated to bring in renewed subscriptions both at home and from America. It was publicly agreed that England's difficulty in South Africa was Ireland's opportunity, and that all should abstain from supporting an amendment to the address which admitted that the war would have to be fought out. Mr John Redmond was chosen chairman, and the alliance of Nationalists and Gladstonians was dissolved. The United Irish League, founded in Mayo in 1898 by Mr William O'Brien, had recently become a sort of rival to the parliamentary party, its avowed object

1900.

being to break up the great grass farms, and its methods resembling those of the old Land League.

The most striking event, however, in Ireland in the earlier part of 1900 was Queen Victoria's visit. Touched by the gallantry of the Irish regiments in South Africa, and moved to some extent, no doubt, by the presence of the duke of Connaught in Dublin as commander-in-chief, the Queen determined in April to make up for the loss of her usual spring holiday abroad by paying a visit to Ireland. The last time Her Majesty had been in Dublin was in 1861 with the Prince Consort. Since then, besides the visit of the prince and princess of Wales in 1885, Prince Albert Victor and Prince George of Wales had visited Ireland in 1887, and the duke and duchess of York in 1897; but the lack of any permanent royal residence and the long-continued absence of the Sovereign in person had aroused repeated comment. Directly the announcement of the Queen's intention was made the greatest public interest was taken in the project. Shortly before St Patrick's Day the Queen issued an order which intensified this interest, that Irish soldiers might in future wear a sprig of shamrock in their headgear on this national festival. For some years past the "wearing of the green" had been regarded by the army authorities as improper, and friction had consequently occurred, but the Queen's order put an end in a graceful manner to what had formerly been a plausible grievance. The result was that St Patrick's Day was celebrated in London and throughout the empire as it never had been before, and when the Queen went over to Dublin at the beginning of April she was received with the greatest enthusiasm.

The general election later in the year made no practical difference in the strength of parties, but Mr George Wyndham took Mr G. Balfour's place as chief secretary, without a seat in the Cabinet. Both before and after the election the United Irish League steadily advanced, fresh branches continually springing up.

The visit of Mr Redmond and others to America in 1901 was not believed to have brought in much money, and the activity of the League was more or less restrained by want of funds. Boycotting, however, became rife, especially in Sligo, and paid agents also promoted an agitation against grass farms in Tipperary, Clare, and other southern counties. In Roscommon there was a strike against rent, especially on the property of Lord De Freyne. This was due to the action of the Congested Districts Board in buying the Dillon estate and reducing all the rents without consulting the effect upon others. It was naturally argued that no one else's tenants could be expected to pay more. Some prosecutions were undertaken, but the Government was much criticized for not using the special provisions of the Crimes Act; and in April 1902 certain counties were "proclaimed" under it. In February 1902 Lord Rosebery definitely repudiated Home Rule, and steps to oppose his followers were at once taken among Irish voters in English constituencies.

(R. BA.)

Ireland, Church of.—The ancient Church of Ireland (described in the Irish Church Act, 1869, by this, its historic title) has a long and chequered history, which it will be interesting to trace in outline. The beginnings of Christianity in Ireland are difficult to trace (see *Ency. Brit.* vol. v. p. 303), but there is no doubt that the first Christian missionary whose labours were crowned with any considerable success was Patrick (*fl. cir.* 450), who has always been reckoned the patron saint of the country. For six centuries the Church of which he was the founder occupied a remarkable position in Western Christendom. Ireland, in virtue at once of its geographical situation and of the spirit of its people, was less affected than other countries by the movements of European thought; and thus its development, social and religious, was largely independent of foreign influences, whether Roman or English. In full communion with the Latin Church, the Irish long preserved many peculiarities, such as their monastic system and the date at which Easter was kept, which distinguished them in discipline, though not conspicuously in doctrine, from the Christians of countries more immediately under papal control. In the 6th, 7th, and 8th centuries Ireland was famous as the home of sacred letters and as the nursery of zealous missionaries who carried the Gospel not only to Scotland, but to Burgundy and Switzerland, with the fervour of Celtic devotion (see *Ency. Brit.* vol. xiii. p. 248). The incessant incursions of the Danes, who were the scourge of the land for a period of nearly three hundred years, prevented the Church from redeeming the promise of her infancy; and at the date of the English conquest of Ireland (1172) she had lost much of her ancient zeal and of her independence. By this time she had come more into line with the rest of Europe, and the Synod of Cashel put the seal to a new policy by its acknowledgment of the papal jurisdiction and by its decrees assimilating the Church, in ritual and usages, to that of England. There was no thought of a breach of continuity (see *Ency. Brit.* vol. viii. p. 490), but the distinctive features of Celtic Christianity gradually disappeared from this time onwards. Thenceforth she was an appanage of the Church of England, the intervention of the stronger island being, however, as distasteful to the Irish in religious as in political affairs. English influence was strong only in the region round Dublin (known as the Pale); and beyond this district the Irish, though they had acquiesced in the discipline of the Church as directed from Rome, to which England was subject like the rest of Europe, were not disposed to view with favour any ecclesiastical reforms which had their origin in the sister country. Thus from the days of Henry VIII. the Reformation movement was hindered in Ireland by national prejudice, and it never succeeded in gaining the allegiance of the Irish people as a whole. The policy which directed its progress was blundering and stupid, and reflects little credit on the English statesmen who were responsible for it (see *Ency. Brit.* vol. xx. p. 337). The episcopal succession was, indeed, unbroken, and the continuity of the Church of Ireland with the ancient Celtic Church is a historical fact. Not only is she in possession of many ancient buildings which have been consecrated to Christian worship for many centuries, such as the cathedrals at Armagh and Dublin, but her bishops can claim descent in direct line from the successors of St Patrick. Nevertheless, she has not gained the people, and she is to this day the Church of a small section only of the population.

The Reformation period begins with the passing of the Irish Supremacy Act (1537). As in England, the changes in religion of successive sovereigns alternately checked and promoted the progress of the movement, although in

Ireland the mass of the people were less deeply affected by the religious controversies of the times than in Great Britain. At Mary's accession five bishops either abandoned, or were deprived of, their sees; but the Anglo-Irish who remained faithful to the Reformation were not subjected to persecution such as would have been their fate on the other side of the Channel. Again, under Elizabeth, while two bishops (Walsh of Meath and Leverous of Kildare) were deprived for open resistance to the new order of things, and while stern measures were taken to suppress treasonable plotting against the constitution, the uniform policy of the Government in ecclesiastical matters was one of toleration. James I. caused the Supremacy Act to be rigorously enforced, but on political rather than on religious grounds. It was in his reign that the first Convocation of the clergy was summoned in Ireland, of which assembly the most notable act was the adoption of the "Irish Articles" (1615). These had been drawn up by Ussher, and were more decidedly Calvinistic in tone than the Thirty-nine Articles, which were not adopted as standards in Ireland until 1634, when Strafford forced them on Convocation. During the Commonwealth period the bishoprics which became vacant were not filled; but on the accession of Charles II. the Church was strengthened by the translation of Bramhall from Derry to Armagh, and the consecration of eight other bishops, among whom was Jeremy Taylor. The short period during which the policy of James II. prevailed in Ireland was one of disaster to the Church; but under William and Mary she regained her former position. She had now been reformed for more than 100 years, but had made little progress; and the tyrannical provisions of the Penal Code introduced by the English Government made her more unpopular than ever. The clergy, finding their ministrations unacceptable to the great mass of the population, were tempted to indolence and non-residence; and although bright exceptions could be named, there was much that called for reform. To William King (1650–1729), Bishop of Derry and subsequently Archbishop of Dublin, it was mainly due that the work of the Church was reorganized, and the impulse which he gave it was felt all through the 18th century. His ecclesiastical influence was exerted in direct opposition to Primate Boulter and his school, who aimed at making the Established Church the instrument for the promotion of English political opinions rather than the spiritual home of the Irish people. In 1800 the Act of Union was passed by the Legislature; and thenceforward, until Disestablishment, there was but one "United Church of England and Ireland."

Continuous agitation for the removal of Roman Catholic disabilities brought about in 1833 the passing of the Church Temporalities Act, one of the most important provisions of which was the reduction of the number of Irish archbishoprics from four to two, and of bishoprics from eighteen to ten, the funds thus released being administered by commissioners. In 1838 the Tithe Rentcharge Act, which transferred the payment of tithes from the occupiers to the owners of land, was passed, and thus a substantial grievance was removed. It became increasingly plain, however, as years passed, that all such measures of relief were inadequate to allay the dissatisfaction felt by the majority of Irishmen because of the continued existence of the Established Church. Her position had been pledged to her by the Act of Union, and she was undoubtedly the historical representative of the ancient Church of the land; but such arguments proved unavailing in view of the visible fact that she had not gained the affections of the people. The census of 1861 showed that out of a total population of 5,798,967 only 693,357 belonged to the Established Church, 4,505,265 being Roman Catholics; and once this had been made clear, the passing of the Act of Disestablishment was only a question of time. Introduced by Mr Gladstone, and passed in 1869, it became law on 1st January 1871. (See ESTABLISHMENT.)

The Church was thus suddenly thrown on her own resources, and called on to reorganize her ecclesiastical system, as well as to make provision for the maintenance of her future clergy. A convention of the bishops, clergy, and laity was summoned in 1870, and its first act was to declare the adherence of the Church of Ireland to the ancient standards, and her determination to uphold the doctrine and discipline of the Catholic and Apostolic Church, while reaffirming her witness, as Protestant and Reformed, against the innovations of Rome. Under the constitution then agreed on, the supreme governing body of the Church is the General Synod, consisting of the bishops and of 208 clerical and 416 lay representatives of the several dioceses, whose local affairs are managed by subordinate Diocesan Synods. The bishops are elected as vacancies arise, and, with certain restrictions, by the Diocesan Synods, the Primate, whose see is Armagh, being chosen by the bishops out of their own number. The patronage of benefices is vested in boards of nomination, on which both the diocese and the parish are represented. The Diocesan Courts, consisting of the bishop, his chancellor, and two elected members, one clerical and the other lay, deal as courts of first instance with legal questions; but there is an appeal to the Court of the General Synod, composed of three bishops and four laymen who have held judicial office. During the years 1871 to 1878 the revision of the Prayer Book mainly occupied the attention of the General Synod; but although many far-reaching resolutions were proposed by the then predominant Evangelical party, few changes of moment were carried, and none which affected the Church's doctrinal position. A two-thirds majority of both the lay and clerical vote is necessary before any change can be made in the formularies, and an ultimate veto rests, on certain conditions, with the house of bishops.

The effects of Disestablishment have been partly good and partly evil. On the one hand, the Church has now all the benefits of autonomy and is free from the anomalies incidental to state control. Her laws are definite, and the authority of her judicial courts is recognized by all her members. The place given to the laity in her synods has quickened in them the sense of responsibility so essential to the Church's progress. And although there are few worldly inducements to men to take orders in Ireland, the clergy are, for the most part, the equals of their predecessors in social standing and in intellectual equipment, while the standard of clerical activity is higher than in pre-Disestablishment days. On the other hand, the vesting of patronage in large bodies like synods, or (as is the case in some districts) in nominators with little knowledge of the Church beyond the borders of their own parish, is not an ideal system, although it is working better as the dangers of parochialism and provinciality are becoming more generally recognized than in the early years of Disestablishment.

The finances are controlled by the Representative Church Body, to which the sum of £7,581,075 to provide annuities for the existing clergy (2043 in number), amounting to £596,913, was handed over by Parliament in 1870. So skilfully was this fund administered that on 31st December 1900, while only 200 annuitants were living, a small balance of £919,192 remained of the capital sum. In addition, the voluntary offerings of the clergy and the laity for the thirty-one years ending 31st December 1900 amounted to £5,494,586, the total moneys at the disposal of the Church amounting at that date to £8,220,073.

Out of the interest on this sum, augmented by the annual parochial assessments, which are administered by the central office, provision has to be made for two archbishops at £2500 per annum, eleven bishops, who receive about £1500 each, and 1534 parochial clergy. Of the clergy only 361 are curates, while 1173 are incumbents, the average annual income of a benefice being about £240, with (in most cases) a house. The large majority of the clergy receive their training in the Divinity School of Trinity College, Dublin. At the census of 1901 the members of the Church of Ireland numbered 579,385 out of a total population of 4,456,546.

Ireland, John (1838–——), Roman Catholic Archbishop of St Paul, Minnesota, U.S.A., was born in Burnchurch, County Kilkenny, Ireland, 11th September 1838. When he was a boy his parents emigrated to America; but he received his theological education in France, and was ordained in St Paul, Minnesota, in 1861. He was chaplain of a Minnesota regiment during part of the Civil War, and afterwards was appointed rector of the cathedral at St Paul. In 1875 he became coadjutor-bishop, in 1884 bishop, and in 1888 archbishop of St Paul. In all his positions he has been active in religious, educational, and charity work; has organized many total abstinence societies; promoted the settlement of the north-west; and aided largely in the establishment of the Roman Catholic university at Washington. He has also been many years president of the state Historical Society of Minnesota, and is author of *The Church and Modern Society* (1896).

Irenaeus (THE SO-CALLED PFAFFIAN FRAGMENTS).—In 1715 a scholar of Tübingen, Christoph Matthäus Pfaff, published at The Hague what professed to be four fragments of the writings of St Irenaeus, which he said that he had discovered in MS. Catenae in the library at Turin (see Migne, *Patr. Graec.*, vii. 1248–1256). The subjects with which they deal are the true knowledge which is according to Christ, the oblation in the Eucharist, Christian freedom as regards fasts and festivals, and the second coming of Christ. If genuine, therefore, they are of no little importance, and on this account they have been frequently made use of and not a little discussed. Scipio Maffei impugned them during Pfaff's lifetime; and their genuineness has often been suspected since, partly on critical grounds, and partly because the alleged MS. Catenae has never been seen since Pfaff's day. On the other hand, they have been as strongly defended, and the general feeling seems to have been that if not genuine fragments of Irenaeus, they were at least in all probability of the 2nd century, the work of some writer like-minded with Irenaeus. Since 1900 the question may be said to have been set at rest entirely by Dr Adolf Harnack, who has proved almost to demonstration that they are forgeries by Pfaff himself. His reasons are shortly as follows: the Catenae are not to be found in the library, and have never been seen by anybody unless by Pfaff; the catalogues of the library show no signs of their existence; Pfaff's statements on the matter were not free from contradiction; the fragments show signs of being based on the Apostolical Constitutions (*q.v.*), and therefore must be later in date than they are; in grammar and style they do not coincide with those either of their alleged author or of their alleged date; they appear to depend upon the text of Halloix's edition of Irenaeus, and a false reading of his is incorporated; the New Testament is used according to the *Textus Receptus;* above all, they represent Pfaff's own theological position, so that the reason for the forgery is supplied. Altogether, Harnack's proof is as ingenious and convincing a piece of argument as could be wished for.

See AD. HARNACK, *Die Pfaff'schen Irenäus-Fragmente als Fälschungen Pfaffs nachgewiesen.* (Gebhardt and Harnack, *Texte und Untersuchungen*, neue Folge, vol. v. part 3, Leipzig, 1900.) (W. E. CO.)

Iriga, a town in the extreme south of the province of Ambos Camarines, Luzon, Philippine Islands, in the district known as La Rinconada on account of its inaccessibility. It has a temperate and very healthful climate. The soil in its vicinity is rich, producing rice, Indian corn, sugar, pepper, cacao, cotton, abacá, tobacco, and copra. The neighbouring forests furnish ebony, molave, tindalo, and other very valuable hardwoods. The language is Bicol. Population, 17,000.

Irkutsk, a government of Asiatic Russia, East Siberia, bounded on the W. by Tomsk and Yeniseisk, on the N. by Yakutsk, on the E. by Lake Baikal and Transbaikalia, and on the S. and S.W. by Mongolia (China). Its area is 287,061 square miles. The most populous region is a belt of plains, from 1200 to 2000 feet in altitude, stretching north-west to south-east between the Sayan mountains on the one side and the Baikal mountains on the other, narrowing as it approaches the town of Irkutsk. The highroad, now the Trans-Siberian Railway, follows this belt. The south-western part of the government is occupied by mountains of the Sayan system, whose exact orography is as yet not well known. From the high plateau of Mongolia (*q.v.*), fringed by the Sayan mountains, of which the culminating point is the snow-clad Munku-Sardyk (11,500 feet), a number of mountain ridges, from 7500 to 8500 feet high, strike off in a north-east direction. Going from south to north they are distinguished as the Tunka Alps, the Kitoi Alps (both snow-clad nearly all the year round), the Ida mountains, and the Kuitun mountains, which, however, are far from being the regular chains running between rivers which most maps show them to be. On the contrary, these highlands are a complex result of upheavals which took place at different geological epochs, and of denudation on a colossal scale. Gold in the north-west (Nizhneudinsk taiga) and graphite of the highest quality (Alibert's mine, 8000 feet) are found in these mountains. A beautiful, fertile valley, watered by the Irkut, spreads between the Tunka Alps and the Sayan, and another somewhat higher plain, but less wide, stretches along to Kitoi. A succession of high plains, from 2000 to 2500 feet in altitude, formed of horizontal beds of Devonian (or Upper Silurian) sandstone and limestone, spreads to the north of the railway along the Angara, the Nizhnyaya Tunguska (its tributary), and the upper Lena, as far as Kirensk. The Bratskaya Steppe is a prairie peopled by Buryats. A mountain region, usually described as the Baikal range, but consisting in reality of several ranges running north-eastwards, across Lake Baikal, and scooped out to form the depression occupied by the lake, is fringed on its north-western slope by horizontal beds of sandstone and limestone. Farther north-east the space between the Lena and the Vitim is filled by another mountain region belonging to the Olekma and Vitim system, composed of several parallel mountain ridges running north-eastwards (across the lower Vitim), and auriferous in the drainage area of

the Mama. The immense Lake Baikal separates Irkutsk from Transbaikalia. The chief rivers of the government are the Angara, which flows from this lake northwards, with numerous sharp windings, and receives from the left several large tributaries, as the Irkut, Kitoi, Byelaya, Oka, and Iya. The Lena is the main means of communication both with the gold mines on the lower Vitim and with the province of Yakutsk. The Nizhnyaya Tunguska flows northwards, to join the Angara in the far north, and the mountain streams tributary to the Vitim water the north-eastern part of the province. The Post-Tertiary formations are represented by glacial deposits in the highlands and loess on their borders. Jurassic deposits are met with in a zone running north-westwards from Lake Baikal to Nizhneudinsk. The remainder of this region is covered by vast series of Carboniferous, Devonian, and Silurian deposits—the first two but slightly disturbed over wide areas. All the highlands are built up of older, half crystalline Cambro-Silurian deposits, which attain a thickness of 2500 feet, and of crystalline slates and limestones of the Laurentian system, with granites, syenites, diorites, and diabases protruding from beneath them. Very extensive beds of basaltic lavas and other volcanic deposits are spread along the border ridge of the high plateau, about Munku-Sardyk, up the Irkut, and on the upper Oka, where cones of extinct volcanoes are found (Junbulak). Earthquakes are frequent in the neighbourhood of Lake Baikal and the surrounding region. Gold is extracted in the Nizhneudinsk district to the extent of about 10,000 oz. yearly; graphite is found on the Botogol or Alibert mountain (abandoned many years since) and on the Olkhon island of Lake Baikal. Brown coal (Jurassic) is found in many places, and coal on the Oka. The salt springs of Usoliye (45 miles west of Irkutsk), as also those on the Ilim and of Ust-Kut (on the Lena), yield annually about 7000 tons of salt. Fireclay, grindstone, marble and mica, lapis-lazuli, granites, and various half-precious stones occur on the Sludyanka (south-west corner of the Baikal). The climate is severe: the mean temperatures are at Irkutsk (1510 feet), being for the year 31° Fahr., for January –6°, for July 65°; at Shimki (valley of the Irkut, 2620 feet), for the year 24°, for January –17°, for July 63°. The average rainfall is 15 inches a year. Immense virgin forests cover all the highlands up to 6200 to 6600 feet. The population, which was 383,578 in 1879, was 506,517 in 1897, of whom 238,997 were women and 60,396 were urban; except about 120,000 Buryats and 1700 Tunguses, they are Russians. In 1890, of a registered population of 465,000, 223,812 were peasants, 34,659 common law and 619 political exiles, 5230 Cossacks, and 14,178 settled and 105,718 nomad natives, chiefly Buryats. The yearly increase of population is 1·4 per cent., to which immigration contributes about 14,000 every year. Schools are numerous at Irkutsk, but quite insufficient in the country, and only 12 per cent. of the children receive education. The soil is very fertile in certain parts of the territory, but meagre elsewhere, and less than a million acres are under crops. Grain has to be imported from West Siberia, and cattle from Transbaikalia. The live stock of the province numbers 292,110 horses, 380,340 horned cattle, and 356,400 sheep. Fisheries on Lake Baikal supply every year about 2,400,000 Baikal herring (*omul*). Industry is only beginning to be developed (iron works, glass works, and distilleries), and all manufactured goods are imported from Russia. (P. A. K.)

Irkutsk, capital of the above province, situated 40 miles west of Lake Baikal, 3378 miles from Moscow by rail, and is connected by rail with the Amur. Several valuable educational institutions have been established; since the great conflagration of 1879 large parts of the town have been built anew. Its commercial importance, in respect of the trade both with China and the interior, has been much increased by the railway. Population, 51,484.

IRON AND STEEL.

Summary.

In the last twenty years of the 19th century the world's production of pig iron more than doubled, and that of steel increased fivefold, while that of wrought iron became of secondary importance. The United States passed from the position of the second to that of by far the greatest producer of both pig iron and steel; its production of the former more than tripled, becoming 46 per cent. greater than that of Great Britain, and its production of steel increased to more than eight and one-half times that of 1880, becoming more than double that of Great Britain, some 70 per cent. greater than that of Germany and Luxemburg together, and 40 per cent. of the total for the whole world. In this period the basic open-hearth and basic Bessemer processes rose from mere beginnings to vast importance, each of them now producing in these, the three great iron-making countries, about as much steel as the whole world made in 1880. Of the total production of steel in these three countries, some 43 per cent. is made by the acid Bessemer process, 20 per cent. by the basic Bessemer, 16 per cent. by the acid open-hearth, 18 per cent. by the basic open-hearth—the process in which the greatest development is now to be expected—and only about 1 per cent. by the crucible and other minor processes. The production of wrought iron in the United States, which in 1880 was 70 per cent. greater than that of steel, is now only about one-sixth that of steel; and wrought iron has practically gone out of use for important objects like rails, and the beams, angles, and other chief parts of bridges and iron buildings, though it will probably long be used for special purposes for which great ease of welding or special ductility is needed. Delicate methods of research have revealed the nature and constitution of the several varieties of iron. This knowledge has contributed in no small degree to the important beginning which has been made in the use of rational methods of thermal treatment, in which a great extension is to be expected, and it has aided in the discovery and utilization of numerous "alloy" steels. For armour plate not only has steel completely displaced wrought iron, but alloy steel, which has been specially and differentially carburized, and has received a special heat-treatment, has come into general use. Much the same is true of many other important objects for which the highest quality is needed; thus all armour-piercing projectiles, and many important forgings for engines, especially marine engines, are made of the same materials. Throughout the manufacture of iron and steel those twenty years witnessed great simplification, extension of the use of mechanical appliances, and, especially in the manufacture of the relatively simple products, such as rails, wire, sheets, tubing, beams, &c., a concentration of the industry into enormous establishments, operating on so large a

scale as to warrant the use of powerful and costly labour-saving machinery and the employment of many highly trained specialists to investigate and watch with the utmost care even the slightest details. In the last ten years of the 19th century alone the cost of labour in many important processes was reduced by about one-half, without reducing wages. Processes for obtaining wrought iron and steel "direct" from the ore lost their immediate, though not wholly their prospective, importance, and at the present time nearly all the ore which is mined is converted into pig iron in the iron blast-furnace. Chiefly by daring, and by the use of more powerful blowing engines and hot-blast stoves, and of better arrangements for cooling and so protecting the lower part of the furnace, the production of the blast-furnace was increased, until the average production of a single Carnegie furnace in 1902, some 200,000 tons per annum, was greater than that of all the United States furnaces in 1830, and ten times that of 1820, and was one-fourth that of the whole world in 1800. By using the waste gases of the blast-furnace in gas engines their importance as sources of power has been greatly increased, so that establishments in which the rolling mills and other machinery adjoin the blast-furnaces, and therefore can be driven by such engines, will be given a new and often an irresistible advantage over their competitors. The use of great "mixers" to lessen the irregularities in the composition of the pig iron as it issues from the blast-furnace enables the Bessemer process to be applied directly to that iron, without allowing it to solidify and thus to dissipate its heat; and this same procedure is coming into use for the open-hearth and tentatively for the puddling process. The capacity of a single Bessemer converter has become as much as 20 tons, and that of the open-hearth furnace 100 tons, and owing to the car casting system and other improvements the production of a single pair of Bessemer converters reaches 50,000 tons per month—a rate forty-four times that of 1870, and more than thrice that of 1880. In some Bessemer works not only is the iron never allowed to cool between its entry into the blast-furnace in the state of ore and its delivery from the rolling mill in the form of rails or even of billets, but in this progress it undergoes no true heating by extraneous fuel, save in the blast-furnace itself, for the pig iron furnishes its own calorific power in the Bessemer converter, and the only other furnace treatment, that of "soaking," merely equalizes the heat of the ingot, and prevents its escape without adding to it.

I. Constitution, &c.

§ 1. *Nomenclature.*—The classification given in Table I. is now firmly established. Until about 1860 there were only three important classes of iron—wrought iron, steel, and cast iron. The essential characteristic of wrought iron was its nearly complete freedom from carbon; that of steel its moderate carbon-content (say between 0·30 and 2 per cent.), which, though great enough to confer the property of being rendered intensely hard by sudden cooling, yet was not so great as to make the metal brittle when cooled slowly; while that of cast iron was a carbon-content so high as to make the metal brittle whether cooled quickly or slowly. This classification was based on carbon-content, or on the properties which it gave. Wrought iron, and certain classes of steel which then were important, necessarily contained much slag or "cinder," because they were made by welding together pasty particles of metal in a bath of slag, without subsequent fusion. But the best class of steel, crucible steel, was freed from slag by fusion in crucibles; hence its name, "cast steel." Between 1860 and 1870 the Bessemer and open-hearth processes introduced a new class of iron, to-day called "mild" or "low-carbon steel," which lacked the essential property of steel, the hardening power, yet differed from the existing forms of wrought iron in freedom from cinder, and from cast iron in being very malleable. Logically it was wrought iron, the essence of which was, that it was (1) "iron" as distinguished from steel, and (2) malleable, *i.e.*, capable of being "wrought." This name did not please those interested in the new product, because existing wrought iron was a low-priced material. The only justifiable alternative would have been to assign a wholly new name to the wholly new product; but as steel was associated in the public mind with superiority, it appeared more profitable to appropriate its valuable name. This was done with the excuse that the new product resembled one class of steel—cast steel—in being free from slag; and, after a period of protest, all acquiesced in calling the new product "steel," which is now its firmly established name. The old varieties of wrought iron, steel, cast steel, and cast iron preserve their old names; the new class is called steel by main force. As a result, certain varieties, such as blister steel, are called "steel" solely because they have the hardening power, and others, such as low-carbon steel, solely because they are free from slag. But the former lack the essential quality—slaglessness—which makes the latter steel, and the latter lack the essential quality—the hardening power—which makes the former steel. "Steel" has come gradually to stand rather for excellence than for any specific quality.

Table I.—*General Classification of Iron and Steel.*

	Containing very little Carbon (say, less than 0·30 per cent.).	Containing an intermediate quantity of Carbon (say, between 0·30 and 2 per cent.).	Containing much Carbon (say, from 2 to 5 per cent.).
Slag-bearing or "Weld-metal" Series.	Wrought Iron. Puddled and bloomary, or charcoal-hearth iron belong here.	Weld Steel. Puddled and blister steel belong here.	
Slagless or "Ingot-metal" Series.	Low-Carbon or Mild Steel, sometimes called "ingot-iron." It may be either Bessemer, open-hearth, or crucible steel.	Half-Hard and High-Carbon Steels, sometimes called "ingot-steel." They may be either Bessemer, open-hearth, or crucible steel. Malleable cast iron also often belongs here.	Cast Iron. Normal cast iron, "washed" metal, and most "malleable cast iron" belong here.
		Alloy Steels. Nickel, manganese, tungsten, and chrome steels belong here.	Alloy Cast Irons.[1] Spiegeleisen, ferro-manganese, and silico-spiegel belong here.

[1] The term "Alloy Cast Irons" is not actually in frequent use, not because of any question as to its fitness or meaning, but because the need of such a generic term rarely arises in the industry.

These anomalies, however confusing to the general reader, in fact cause no appreciable trouble to important makers or users of iron and steel, beyond forming an occasional side-issue in litigation. If, however, we are to have a nomenclature comprehensible to the general public, we may adopt the following definitions, in which the essential distinction between steel and cast iron is that the former is malleable at least in some one range of temperature, malleableness being probably the only important specific property which to-day distinguishes all steels from all cast irons:—

Wrought Iron, slag-bearing, malleable iron, which does not harden materially when suddenly cooled.

Steel, iron which is malleable at least in some one range of temperature, and also is either (*a*) cast into an initially malleable mass; or (*b*) is capable of hardening by sudden cooling; or (*c*) is both so cast and so capable of hardening. (Tungsten steel and certain classes of manganese steel are malleable only when red-hot.)

Cast Iron, iron containing so much carbon or its equivalent as not to be malleable at any temperature.

Malleable Cast Iron, iron which has been cast in the condition of cast iron and made malleable by subsequent treatment without fusion.

Alloy Steels and *Cast Irons* are those which owe their properties chiefly to the presence of one or more elements other than carbon.

Ingot Iron, slagless steel with less than 0·30 per cent. of carbon.

Ingot Steel, slagless steel containing more than 0·30 per cent. of carbon.

Weld Iron, the same as wrought iron.

Weld Steel, slag-bearing varieties malleable at least at some one temperature, and containing more than 0·30 per cent. of carbon.

These definitions cover not all conceivable, but simply the present important classes of iron. Should others later become important, their nomenclature will then be determined solely by trade reasons.

§ 2. *Constitution.*—The great advance which has taken place in our knowledge of the constitution of steel and the other varieties of iron has shown that they resemble very closely the igneous and metamorphic rocks, *i.e.*, exactly those which, like the different varieties of iron, have formed from the cooling of molten or at least pasty masses. Just as a granite on close examination is seen to consist of an aggregation of crystalline fragments of mica, quartz, and felspar, each of which is a perfectly definite chemical compound, with definite crystalline form and definite physical properties in general, so the microscope shows us that a given piece of steel or iron usually consists of extremely minute crystalline particles of two or more substances, each of which is a definite entity, with definite chemical composition and definite physical properties. But besides the granitic type, certain varieties of iron seem to represent the obsidian type. In this, as in aqueous solutions, the ratios in which the different chemical substances, the silica, lime, &c., exist are not fixed or definite; they vary from case to case, not *per saltum* as between definite chemical compounds, but by infinitesimal gradations. The different substances present appear to be dissolved, as it were, in each other in a sort of solid solution which presents the indefiniteness of composition, the incapacity of being resolved by any magnification of the microscope, and the feeble chemical attraction between the different components, characteristic of a solution. The schistose structure of rock masses, their columnar or basaltic structure, arranged in columns perpendicular to the cooling surface, their "vugs" or cavities lined with specimens of free crystals, their segregation, &c., are reproduced in a most interesting way in metallic masses.

Of these different microscopic entities which constitute the different varieties of iron, only the following here need consideration:—

(1) *Ferrite*, the name assigned to the microscopic particles of nearly—perhaps perfectly—pure metallic iron. It is very soft and ductile.

(2) *Cementite*, a definite carbide of iron, Fe_3C, very brittle, harder than hardened steel, scratching glass and felspar, but not quartz ($H=6$), and present in proportions which in a general way increase with the proportion of carbon present. It is the substance to which chilled cast iron usually owes its hardness and brittleness.

(3) *Pearlite.* Slowly cooled steels in general consist essentially of a mixture of ferrite and cementite, in proportions corresponding to the carbon-content of the mass as a whole. But these two substances habitually interstratify as a "eutectic"[1] conglomerate called pearlite (Fig. 1) in the ratio of about seven parts of ferrite to one of cementite, hence containing about 0·90 per cent. of carbon. Steels containing either more or less carbon than 0·90 per cent., that is, an excess of cementite or ferrite over the eutectic ratio of 7 : 1, are a conglomerate of pearlite plus this excess (Fig. 2). They are called hyper-eutectic or hypo-eutectic according as this excess is cementite or ferrite, *i.e.*, according as their carbon-content is above or below the 0·90 per cent. which the eutectic itself contains. Their constitution is shown in Fig. 3, in which the ordinates of the line ABC represent the percentage of pearlite corresponding to each percentage of carbon, and the intercept ED or FG of any point D or F measures the percentage of the excess of ferrite or cementite for hypo- and hyper-eutectic steels respectively.

FIG. 1.—Pearlite.

(4) *Martensite*, the characteristic and chief constituent of hardened steel, is a hard, brittle mass, with a needle-like structure, consisting of iron containing carbon in proportions which vary from nothing up to about 2 per cent. As it has not yet been resolved by the microscope into different components, we regard it provisionally as a "solid solution," the ultimate constituents of which are iron and carbon; as to the nature of its proximate constituents we can as yet only speculate. When it contains 0·90 per cent. of carbon, and thus corresponds in ultimate composition to pearlite, it is called *hardenite*.

FIG. 2.—Pearlite with ferrite. (Sorby.) The polygons are pearlite; the network is ferrite.

(5) *Graphite*, a characteristic component of "grey cast iron," of which it usually forms from 2·50 to 3·50 per cent. It is nearly pure carbon, in very thin laminated plates or flakes, often curved. In grey cast iron these flakes form a nearly continuous skeleton; and as they readily split open when a piece of this iron is broken, rupture passes through them, with the result that, even though the graphite may form only some 3 per cent. of the mass by weight (say 10 per cent. by volume), practically nothing but graphite is seen in the fracture. Hence the weakness and the dark grey fracture of "grey cast iron," and hence, by brushing this fracture with a wire brush and so detaching these loosely adherent flakes of graphite, the colour can be changed nearly to the very light grey of pure iron.

(6) *Slag*, the characteristic component of wrought iron, in which it is usually present to the extent of 0·20 to 2·00 per cent., is essentially a silicate of iron, and is present in wrought iron simply because this product is made by welding together pasty granules of iron in a bath of such slag, without ever melting the resultant mass or otherwise giving the envelopes of slag thus imprisoned a chance to escape completely.

(7) *Austenite, troostite, sorbite*, and other constituents have also been described.

(8) Fig. 4 shows how the occurrence of these constituents varies both with the temperature and with the proportion of carbon present. The Roman letters indicate the constituents normal and stable in each of the many fields into which it is divided. Before considering this diagram we must recognize the further complication in the constitution of iron, due to its having at least three distinct allotropic modifications, α, β, and γ, each corresponding to a distinct range of temperature.

(9) α iron is the weak, ductile, magnetic variety, stable below A_2, Fig. 4, characteristic of wrought iron and of low-carbon steel.

[1] A "Eutectic" is the last-freezing part of an alloy and corresponds to what the mother-liquor of a saline solution would become if such a solution, after the excess of saline matter was crystallized out, were finally completely frozen. It is the mother-liquor or "Bittern" frozen. Its striking characteristics are: (1) that for given metals alloyed together its composition is fixed, and does not vary with the proportions in which those metals are present, the "excess-metal" freezing before the eutectic; (2) that though thus constant, its composition is not in simple atomic proportions; (3) that its freezing-point is constant; and (4) that it consists of interstratified layers of the metals which compose it. (See ALLOYS and FUSION.)

FIG. 3.—Diagram of the constitution of the iron carbon compounds. (Sauveur.)

N.B.—The "carbon-content" of this diagram refers only to the carbon actually combined with the iron, and excludes that which is present as graphite. This may be regarded as a foreign body. For instance, a grey cast iron containing 3·50 per cent. of carbon, of which 3 per cent. is graphite and only 0·50 per cent. combined, may be looked upon as in effect a hypo-eutectic steel, approximately rail steel, containing 0·50 per cent. of carbon (H in the figure), but contaminated with 3·00 per cent. of graphite as a foreign body.

(10) β iron is the non-magnetic variety, stable between A_2 and A_3, probably very hard and brittle, and probably characteristic of certain self-hardening steels, such as manganese steel containing 7 per cent. of manganese, and of normal or "carbon" steel when hardened by sudden cooling.

(11) γ iron is the non-magnetic variety, stable above A_3, characteristic of nickel and 12 per cent. manganese steels, and probably relatively hard, but ductile.

In Fig. 4, AB and BD represent the freezing-point of iron for different proportions of carbon, and the lines below these, aBc, GOS, SE, MO, and PSP′ represent spontaneous retardations which occur during the undisturbed further slow cooling, showing that at these several lines heat is evolved within the metal, and hence that some molecular rearrangement occurs. Each of the tripartite groups of lines, (1) AB, BD, aBc, and (2) GOS, SE, PSP′, is of the family of curves of the solidification of those solutions which in freezing break up to form a mechanical mixture of (*a*) a eutectic, and (*b*) the component of that eutectic which is in excess over the eutectic ratio. The natural inference that these two groups here represent analogous occurrences is thus far well supported by the evidence.

To illustrate the meaning of the diagram let us follow by means of the ordinate QUW the undisturbed slow cooling from the molten state of a hyper-eutectic steel containing 1·00 per cent. of carbon. When the gradually falling temperature reaches 1460° C., (Q) the mass as a whole freezes gradually, forming martensite, apparently simply a solidified solution of carbon in γ iron, which, though solid, preserves the essential characteristics of a solution. The heat evolved during solidification retards the fall of temperature; after this the rate of cooling remains regular until T (850°) on the line STE (A_{r3}) is reached, when a second retardation occurs, due to the heat liberated by the passage within the pasty mass of part of the iron and carbon from a state of mere solution to that of definite combination in the ratio Fe_3C, forming microscopic particles of cementite, while the remainder of the iron and carbon continue dissolved in each other as martensite. This formation of cementite continues as the temperature falls, till at about 690° C., (U, called $A_{r3\text{-}1}$) so much of the carbon (in this case about 0·10 per cent.) and of the iron has united in the ratio of cementite, that the composition of the remaining solid-solution or "mother-metal" of martensite has reached that of hardenite; *i.e.*, it now contains 0·90 per cent. of carbon. As the temperature now falls past 690°, this hardenite mother-metal in turn splits up, after the fashion of eutectics, into alternate layers of ferrite and cementite grouped together as pearlite, so that the mass as a whole now becomes a mixture of pearlite with cementite. The iron thus liberated, as the ferrite of this pearlite, changes simultaneously to α ferrite. The passage of this large quantity of carbon and iron, 0·90 per cent. of the former and 12·6 of the latter, from a state of mere solution as hardenite to one of definite chemical union as cementite, together with the passage of the iron itself from the γ to the α state, evolves so much heat as actually to heat the mass up so that it brightens in a striking manner. This phenomenon is called the "recalescence." The change from martensite to ferrite and cementite is accompanied by the loss of the hardening power, as will be explained shortly.

To take a second case, molten hypo-eutectic steel of 0·20 per cent. of carbon on freezing at K passes to the state of martensite, γ iron with this 0·20 per cent. of carbon dissolved in it. Its further cooling undergoes three spontaneous retardations, one at K′ (A_{r3}), at about 820° C., at which part of the iron isolates itself in separate crystals within the solid solution as ferrite, and in crystallizing passes from the γ to the β state, that is, free iron of the β allotropic modification. At the second retardation, K″ (A_{r2}), which occurs at about 770° C., this β ferrite changes to the normal and magnetic α state, so that the metal becomes magnetic. Moreover, the crystallization of ferrite within the martensite, which began at A_{r3}, continues until 690° or A_{r1} is reached, by which time so much iron has separated out that the remaining mother-metal has reached the composition of hardenite, *i.e.*, it now contains 0·90 per cent. of carbon. Again, as the temperature in turn falls past A_{r1}, this hardenite mother-metal splits up into cementite and ferrite grouped together as pearlite, with simultaneous change of this ferrite to the α state, and with the resulting recalescence. All these phenomena are parallel with those of 1·00 per cent. carbon steel at this same critical point A_{r1}. As such steel cools slowly past A_{r3}, A_{r2}, and A_{r1}, it loses its hardening power progressively. In short, from A_{r3} to A_{r1}, the excess

substance, ferrite or cementite, in hypo- and hyper-eutectic steels respectively, progressively crystallizes out within the martensite mother-metal, which thus progressively approaches the composition of hardenite, reaching it at A_{r1}, and there splitting up into ferrite and cementite interstratified as pearlite. Further, any ferrite liberated at A_{r3} changes there from γ to β, and any present at A_{r2} changes from β to α. Between O and S, A_{r3} and A_{r2} occur together, as do A_{r2} and A_{r1} between S and P′, and A_{r3}, A_{r2}, and A_{r1} at S itself; so that these critical points in these special cases are called $A_{r3\text{-}2}$, $A_{r2\text{-}1}$, and $A_{r3\text{-}2\text{-}1}$ respectively. The corresponding critical points which occur during rise of temperature, with the reverse transformations, are called A_{c1}, A_{c2}, A_{c3}, &c., A (Chernoff) being their generic name, r referring to falling temperature (refroidissant), and c to rising temperature (chauffant, Osmond).

To take a third case, that of hyper-eutectic steel containing

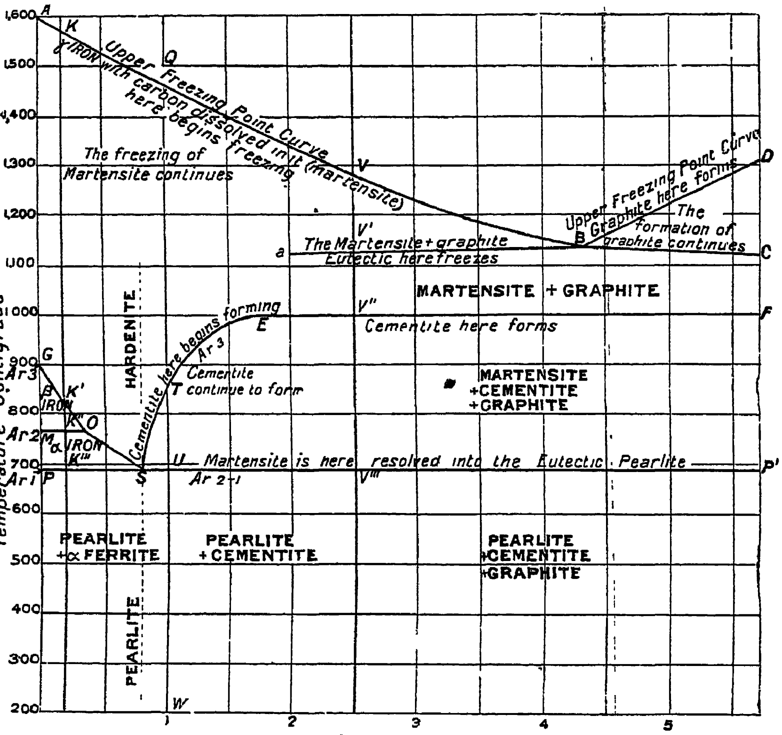

FIG. 4.—The constitution of iron and steel. (After Roberts-Austen, with modifications by Bakhuis Roozeboom.) The Roman letters indicate the constituents normal and stable in each of the many fields into which the diagram is divided. The transformations which in cooling occur at the horizontal and oblique boundary lines of these fields are indicated in italics.

2·50 per cent. of carbon, and thus approaching the limits of cast iron: since some 2 per cent. of carbon suffices to saturate solid γ iron, the martensite, which progressively freezes out as the temperature sinks below V, tends to reject, and thus to leave in the still molten matrix of entangled mother-metal, all carbon in excess of this quantity. This progressive separation of martensite, with consequent enrichment of the mother-metal in carbon, continues with further fall of temperature until, when 1125° C. (V′ on aBc) has been reached, the carbon-content of the mother-metal has reached 4·30 per cent., which is that of the martensite plus graphite eutectic. As the temperature now sinks past aBc this mother-metal in turn freezes as a whole, splitting up into the eutectic conglomerate of martensite plus graphite, and, as in the other cases, the heat thus liberated retards the cooling. When the temperature falls to 1000°, part of the graphite already formed unites with part of the iron of the martensite to form cementite; so that between V″ and V‴ the mass is a conglomerate of martensite, cementite, and graphite. On reaching A_{r1} at V‴ this martensite (now become hardenite) as usual splits up into pearlite, and the mass now becomes a conglomerate of pearlite, cementite, and graphite, and remains so after cooling is complete.

As we pass to cases with higher and higher carbon-content, the martensite which begins freezing on cooling past the line AB forms a smaller and smaller proportion of the whole, and the martensite-graphite eutectic which forms at the second freezing-point aB increases in amount until, when the carbon-content reaches 4·30 per cent., there is but a single freezing-point, and the whole mass when solid is made up of this eutectic. If there be more than 4·30 per cent. of carbon, then not martensite but graphite solidifies between BD and Bc, but, as before, the martensite-graphite eutectic freezes at the lower freezing-point Bc. But in either case the changes occur at EF and PSP′ which have been described for hyper-eutectic steel of 2·50 per cent. of carbon.

Just as the presence of carbon shifts the positions of the freezing-point and of the various critical points, so does that of other elements, notably silicon, phosphorus, manganese, chromium, nickel, and tungsten. Nickel and manganese lower these critical points, so that, with 25 per cent. of nickel or with 13 per cent. of manganese, A_{r3} lies below the common temperature of 20° C. These steels then normally consist of γ iron, modified by the large amount of nickel or manganese with which it is alloyed. They naturally are non-magnetic, or very feebly magnetic. But the critical points of such nickel steel, though thus depressed, are not destroyed; and if it be cooled in liquid air below its A_{r2}, it passes to the α state and becomes magnetic.

§ 3. *Thermal Treatment.*—The hardening, tempering, and annealing of steel, the chilling and annealing of cast iron, and the annealing of malleable cast iron, are readily explained by the facts just set forth. Sudden cooling hardens and embrittles steel and cast iron because it retains the high temperature martensite state, by denying the time needed for these successive transformations which, in slow cooling, finally yield a mixture of pearlite either with ferrite, or with cementite alone, or with cementite and graphite; in the cold these transformations cannot take place, thanks to molecular rigidity or other cause. The suddenly cooled metal is hard and brittle, because the cold martensite which it contains is hard and brittle. The degree of hardening which steel undergoes increases with its carbon-content, either (1) because the hardness of martensite increases with its own carbon-content; or (2) because during sudden cooling the presence of carbon, like a brake, impedes the change from martensite to pearlite with ferrite or cementite, thus leading to a more complete retention of the martensite, or of the intermediate β state of the ferrite; or (3) for both reasons.

But these transformations, though restrained by the sudden cooling, still tend to occur; if we reheat hardened steel to say 250° C. (482° F.) as in tempering, we so far relax this restraint that part of the martensite, thus forcibly retained, changes to pearlite with ferrite or cementite. We undo the effect of the sudden cooling, to a degree which increases with the temperature of reheating or "tempering," and with the degree of molecular freedom which it gives. If the reheating be carried still farther, to a dull red heat, the restraint is wholly relaxed, so that the change from martensite to pearlite and cementite becomes complete; the metal is as soft and ductile as if the cooling had been slow instead of sudden; it is annealed.

"Chilling" cast iron, *i.e.*, hastening its cooling by casting it in a cold mould, restrains the separation of graphite by hurrying the metal through the range between ABD and EF in which graphite tends to form, and retains in its stead the supersaturated martensite which the metal forms on sudden solidification, more or less split up into pearlite and cementite on passing $A_{r2\text{-}1}$. The annealing of such iron may occur in either of two degrees—a small one, as in making common chilled cast iron objects, such as railway car wheels, or a great one, as in making malleable cast iron. In the former case, the objects are heated only to the neighbourhood of A_{r1}, so that the martensite may resolve itself into pearlite and cementite. The joint effect of such chilling and such annealing is to make the metal much harder than if slowly cooled, because for each 1 per cent. of graphite which the chilling

suppresses, the annealing substitutes 15[1] per cent. of the glass-hard cementite.

In making "malleable cast iron" the reheating is carried to a temperature near or perhaps above EF, so that the graphite-forming tendency, suppressed by the initial relatively rapid cooling—a suppression favoured by the special composition of the cast iron used—asserts itself. Since graphite and iron combine to form cementite when the temperature sinks past 1000°, reheating the metal above 1000° should cause cementite to split up into martensite plus graphite. Graphite now forms slowly within the mass; but whereas the graphite which separates when common cast iron objects cool slowly from the melting-point forms large flakes which weaken and embrittle the metal by breaking up its continuity, that which now separates forms a fine powder, naturally much less injurious. For this heating the castings are packed in a mass of iron oxide, which at this temperature gradually removes the fine or "temper" graphite by oxidizing that in the outer crust to carbonic oxide, whereon the carbon farther in begins diffusing outwards by "molecular migration," to be itself oxidized on reaching the crust. This removal of graphite doubtless further stimulates the formation of graphite, by relieving the mechanical and perhaps the osmotic pressure. Thus, first, for the brittle glass-hard cementite and martensite there is gradually substituted the relatively harmless temper graphite; and, second, even this is in large part removed by surface oxidation.

Each of these ancient processes thus consists essentially in so manipulating the temperature that, out of the several possible constituents, the metal shall actually consist of a special set in special proportions. But in addition there is another very important principle underlying many of our thermal processes, viz., that the state of aggregation of certain of these constituents, and through it the properties of the metal, as a whole, are profoundly affected by temperature manipulations. Thus, prior exposure to a temperature materially above A_{c1} coarsens the structure of most steel, in the sense of giving it when cold a coarse fracture, and enlarging the grains of pearlite, &c., found in the slowly-cooled metal. This coarsening and the brittleness which accompanies it increase with the temperature to which the metal has been exposed. Steel which after a slow cooling from about 722° C. will bend 166° before breaking, will, after slow cooling from about 1050° C., bend only 18° before breaking. This injury fortunately can be cured either by *reheating* the steel to A_{c1}, when it "refines," *i.e.*, returns spontaneously to its fine-grained ductile state (*cooling* past A_1 does not have this effect); or by breaking up the coarse grains by *mechanical distortion*, *e.g.*, by forging or rolling. For instance, if steel has been coarsened by heating to 1400° C., and if, when it has cooled to a lower temperature, say 850° C., we forge it, its grain-size and ductility when cold will be approximately those which it would have had if heated only to 850°. Hence steel which has been heated very highly, whether for welding, or for greatly softening it so that it can be rolled to the desired shape with but little expenditure of power, ought later to be refined, either by reheating it from below A_{r1} to A_{r1}, or by rolling it after it has cooled to a relatively low temperature, *i.e.*, by having a low "finishing temperature." Steel castings initially have the extremely coarse structure due to cooling without mechanical distortion from their very high temperature of solidification; they are "annealed," *i.e.*, this coarseness and the consequent brittleness are removed, by reheating them to the critical range, which also relieves the internal stresses due to the different rates at which different layers cool, and hence contract, during and after solidification. For steel containing less than some 0·13 per cent. of carbon, the embrittling temperature is in a different range, near 700° C., and such steel refines at temperatures above 900° C.

When we consider the great number of different regions in Fig. 4, each with its own set of constituents, and remember that by different rates of cooling from different temperatures we can retain in the cold metal these different sets of constituents in widely varying proportions; and when we further reflect that not only the proportion of each constituent present but also its state of aggregation can be controlled by thermal treatment, we see how vast a field is here opened, how great a variety of different properties can be induced in any individual piece of steel, how enormous the variety of properties thus attainable in the different varieties collectively, especially since for each percentage of carbon an incalculable number of varieties of steel may be made by alloying it with different proportions of such elements as nickel, chromium, &c. As yet there has been only the roughest survey of certain limited areas in this great field, the further exploration of which will enormously increase the usefulness of this wonderful metal.

[1] Fifteen per cent., if we add together both the "excess" cementite and that contained in the eutectic pearlite, which result finally from the carbon which has been prevented from separating as graphite.

§ 4. *Alloy steels* have come into extensive use for important special purposes, and a very great increase of their use is to be expected. The chief ones are nickel steel, manganese steel, chrome steel, and tungsten steel. The general order of merit of a given variety or specimen of iron or steel may be measured by the degree to which it combines strength and hardness with ductility. These two classes of properties tend to exclude each other, for, as a general rule, whatever tends to make iron and steel hard and strong tends to make it correspondingly brittle, and hence liable to break treacherously, especially under shock. Manganese steel and nickel steel form an important exception to this rule, in being at once very strong and hard and extremely ductile. *Nickel steel*, which usually contains from 3 to 3·50 per cent. of nickel and about 0·25 per cent. of carbon, combines very great tensile strength and hardness, and a very high limit of elasticity, with great ductility. Its combination of ductility with strength and hardness has given it very extended use for the armour of war-vessels. For instance, following Krupp's formula, the side and barbette armour of war-vessels is now generally if not universally made of nickel steel containing about 3·25 per cent. of nickel, 0·25 per cent. of carbon, and 1·50 per cent. of chromium, deeply carburized on its impact face. Here the merit of nickel steel is not so much that it resists perforation, as that it does not crack even when deeply penetrated by a projectile. The combination of ductility, which lessens the tendency to break when overstrained or distorted, with a very high limit of elasticity, gives it great value for shafting, the merit of which is measured by its endurance of the repeated stresses to which its rotation exposes it whenever its alignment is not mathematically straight. The alignment of marine shafting, changing with every passing wave, is an extreme example. Such an intermittently applied stress is far more destructive to iron than a continuous one, and even if it be only half that of the limit of elasticity, its indefinite repetition eventually causes rupture. In a direct competitive test the presence of 3·25 per cent. of nickel increased nearly sixfold the number of rotations which a steel shaft would endure before breaking.

As actually made, *manganese steel* contains about 12 per cent. of manganese and 1·50 per cent. of carbon. Although the presence of 1·50 per cent. of manganese makes steel brittle, and although a further addition at first increases this brittleness, so that steel containing between 4 and 5·5 per cent. can be pulverized under the hammer, yet a still further increase gives very great ductility, accompanied by great hardness—a combination of properties which was not possessed by any other known substance when this remarkable alloy, known as Hadfield's manganese steel, was discovered. Its ductility, to which it owes its value, is profoundly affected by the rate of cooling. Sudden cooling makes the metal extremely ductile, and slow cooling makes it brittle; its behaviour in this respect is thus the opposite of that of carbon steel. Its great hardness, however, is not materially affected by the rate of cooling. It is used extensively for objects which require both hardness and ductility, such as rock-crushing machinery, railway crossings, mine-car wheels, and safes. The burglar's blow-pipe locally "draws the temper," *i.e.*, softens a spot on a hardened carbon steel or chrome steel safe by simply heating it, so that as soon as it has again cooled he can drill through it and introduce his charge of dynamite. But neither this nor any other known procedure softens manganese steel. This very fact that it is unalterably

hard has, however, limited its use, because of the great difficulty of cutting it to shape, which has in general to be done with emery wheels instead of the usual iron-cutting tools. Another defect is its relatively low elastic limit.

Chrome steel, which usually contains about 2 per cent. of chromium and 0·80 to 2 per cent. of carbon, owes its value to combining, when in the "hardened" or suddenly cooled state, intense hardness with a high elastic limit, so that it is neither deformed permanently nor cracked by extremely violent shocks. For this reason it is the material generally if not always used for armour-piercing projectiles. It is much used also for certain rock-crushing machinery (the shoes and dies of stamp-mills), and for safes. These are made of alternate layers of chrome steel and soft wrought iron, hardened by sudden cooling. The hardness of the hardened chrome steel resists the burglar's drill, and the ductility of the wrought iron the blows of his sledge.

Tungsten steel, which usually contains from 5 to 10 per cent. of tungsten and from 1 to 2 per cent. of carbon, is used for magnets, because of its great retentivity, and for lathes and similar metal-cutting tools which are to cut off a very thick slice at each cut. The great friction, due to the thickness of the cut, heats the tool to a temperature at which the temper of common or "carbon" steel is drawn. The merit of tungsten steel is that, like manganese steel, it retains its extreme hardness even after it has been heated to 400° C. (752° F.). Under these conditions the Taylor and White variety retains its cutting power even when the friction is so great that the chips of metal cut are so hot as to glow visibly, and even the edge of the tool itself grows red-hot.

§ 5. *Deep Carburizing; Harvey and Krupp Processes.*—Much of the heavy side armour of war-vessels is made of nickel steel initially containing so little carbon that it cannot be hardened, *i.e.*, it remains very ductile even after sudden cooling. The impact face of these plates is given the intense hardness needed by being converted into high-carbon steel, and then hardened by sudden cooling. Harvey carburized the impact face to a depth of about an inch by heating the plate for about a week to about 1200° C. (2192° F.), with that face strongly pressed against a bed of charcoal. The Krupp process, a newer one, carburizes the impact face by exposing it at a high temperature to illuminating gas. This is decomposed by the heat, and deposits on the face of the plate a layer of fine carbon, which is absorbed by the steel as in the cementation process. The impact face thus carburized is cooled suddenly from a red heat, *e.g.*, by spraying it with iced brine. An intensely hard impact surface results, the hardness decreasing gradually from this face inwards. Thanks to the glass-hardness of the face, the projectile is arrested so abruptly that it is shattered, and its energy is delivered piecemeal by its fragments; but as the face is integrally united with the unhardened, ductile, and slightly yielding interior and back, the plate, even if it be bent backwards somewhat by the blow, neither cracks nor flakes.

II. Extraction of Iron from its Ores.

§ 6. The *blast-furnace process* has been so much cheapened by the great increase in its rate of production, and by the introduction of mechanical appliances for handling the raw materials and the iron and slag, that it is now the sole important process of extracting iron from its ores. Practically all the iron ore mined passes through the blast-furnace, if we except the relatively small quantity used in the puddling and the open-hearth processes, each of which may recover a fraction of the iron of the ore used in it. The blast-furnace has a very great advantage over the direct processes of extracting wrought iron or steel from

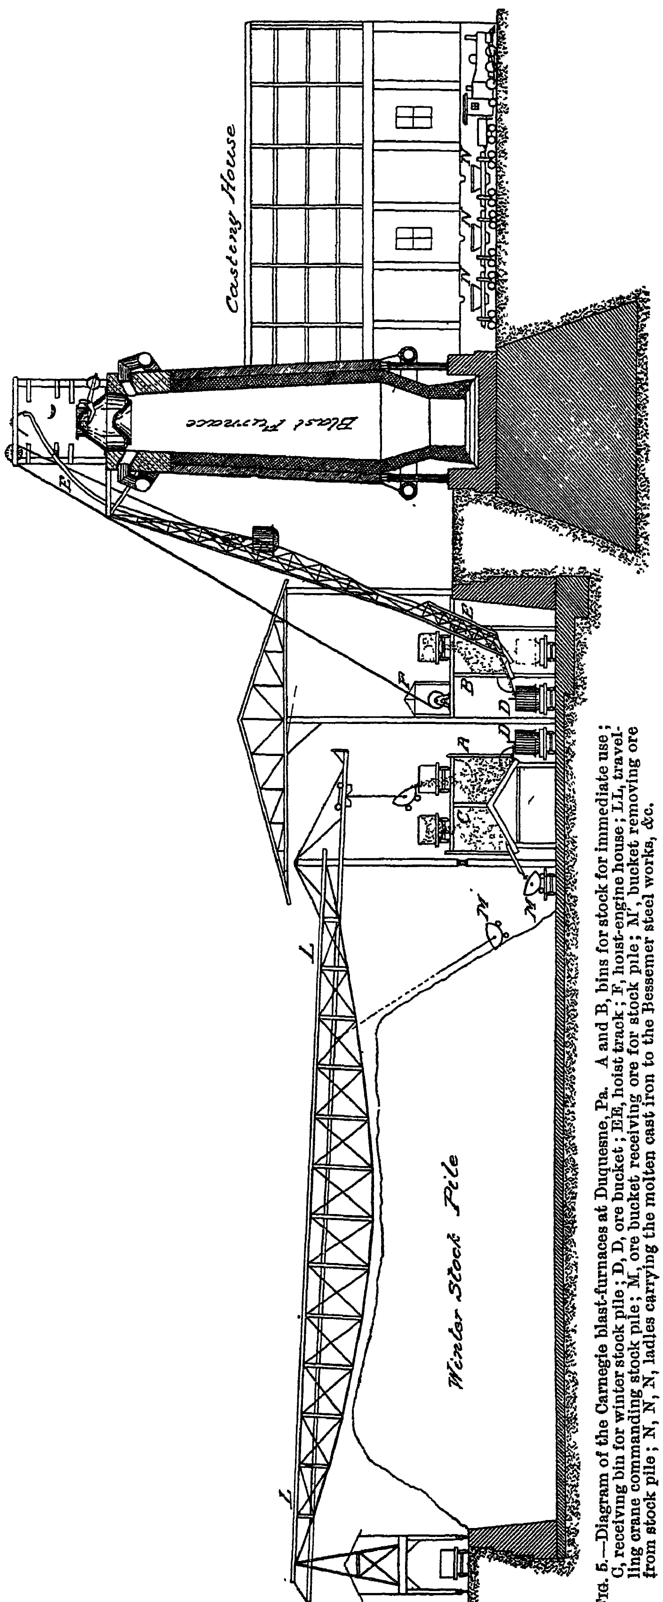

Fig. 5.—Diagram of the Carnegie blast-furnaces at Duquesne, Pa. A and B, bins for stock for immediate use; C, receiving bin for winter stock pile; D, D, ore bucket; EE, hoist track; F, hoist-engine house; LL, travelling crane commanding stock pile; M, ore bucket receiving ore for stock pile; M', bucket removing ore from stock pile; N, N, N, ladles carrying the molten cast iron to the Bessemer steel works, &c.

the ore, in recovering nearly the whole of the iron present, and in delivering both its products, the metal and the slag, in a molten state, in which they can be handled far

more cheaply than if solid or pasty. It is not easy to see how either of these things can be accomplished by any direct process. The advantages of the blast-furnace are so great, that not only have the direct processes practically

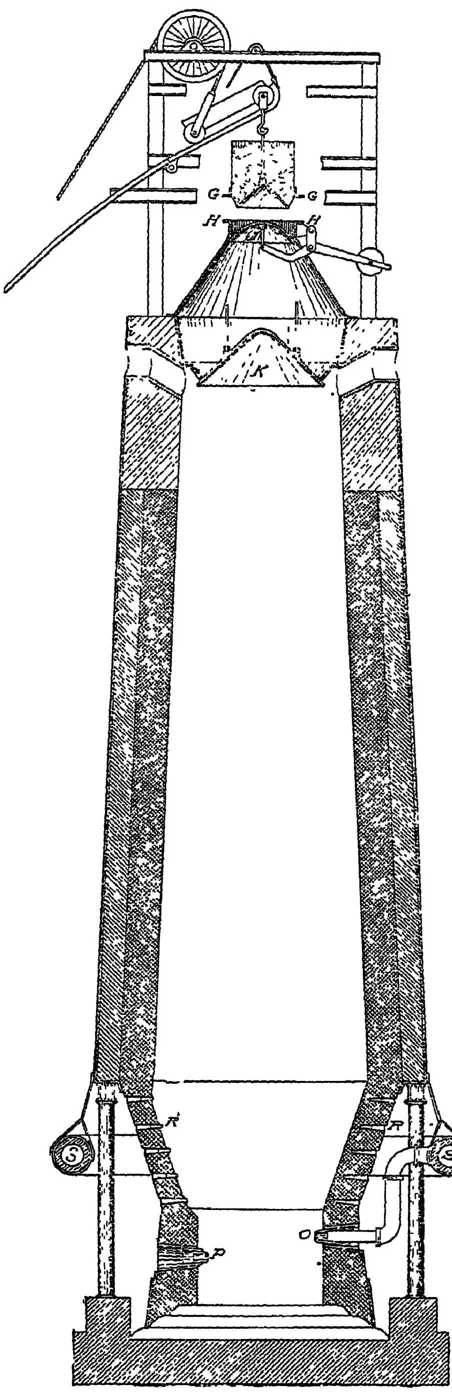

FIG. 6.—Section of one of the Duquesne blast-furnaces. GG, flanges on the ore bucket; HH, fixed flanges on the top of the furnace; J, counter-weighted false bell; K, main bell; O, tuyere; P, cinder notch; R, R', water-cooled boxes; S, blast pipe.

ceased to exist, but we can hardly see in what way they are to be revived, unless it be through some modification of the blast-furnace process itself, which shall bring the composition of its product nearer to that of steel, *i.e.*, shall give it less carbon and silicon than are present in cast iron as now made. The stumbling-block in the way of developing such a modification is the removal of sulphur. The processes for converting cast iron into steel can now remove phosphorus easily, but the removal of sulphur in them is so difficult that it has to be accomplished for the most part in the blast-furnace itself. In the latter there have been remarkable economies in the mechanical arrangements for handling the ore, flux, and fuel, and the cast iron and slag; a great improvement in the protection of the inner walls of the furnace by better water-cooling; and a remarkable increase in the output, chiefly due to the use of extremely powerful blowing engines and blast-heating stoves. But the latest great advance, the use in gas engines of the waste gases escaping from the top of the furnace, is perhaps the most striking and important of all.

A. *The Handling of Raw Materials.*—That any of the raw materials should be shovelled by hand is a thing

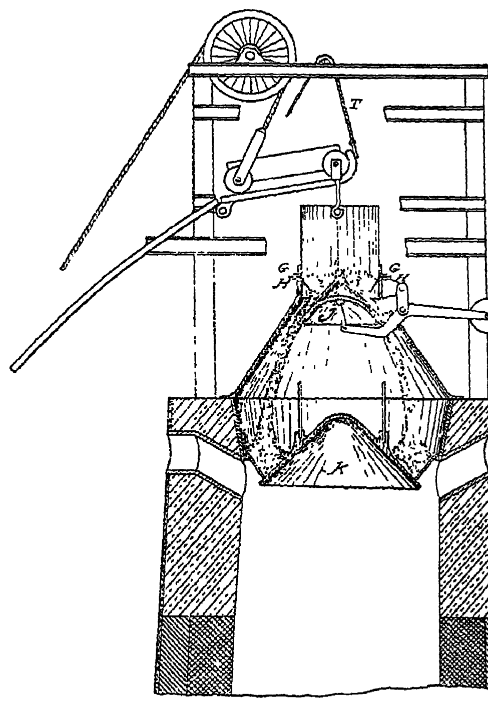

FIG. 7.—Diagram showing the transfer of the ore from the bucket to the main charging bell. Lettering as in Fig. 6.

no longer even to be considered in designing new works, at least in the United States. The arrangement at the Carnegie Company's Duquesne works (Fig. 5) may serve as an example of modern methods of handling.

The standard-gauge cars which bring the ore and coke to Duquesne pass over one of three very long rows of bins, A, B, and C (Fig. 5), of which A and B receive the materials (ore, coke, and limestone) for immediate use, while C receives those to be stored for winter use. From A and B the materials are drawn as they are needed into large buckets D standing on cars, which carry them to the foot of the hoist track EE, up which they are hoisted to the top of the furnace. Arrived here, the material is introduced into the furnace without allowing any of the furnace gas to escape by an ingenious piece of mechanism. The hoist-engineer in the house F at the foot of the furnace, when informed by means of an indicator that the bucket has arrived at the top, lowers it so that its flanges GG (Fig. 6) rest on the corresponding fixed flanges HH, as shown in Fig. 7. The further descent of the bucket being thus arrested, the special cable T is now slackened, so that the conical bottom of the bucket drops down, pressing down by its weight the counter-weighted false cover J of the furnace, so that the contents of the bucket slide down into the space between this false cover and the true charging bell, K. The special cable T is now tightened again, and lifts the bottom of the bucket so as both to close it and to close the space between J and K, by allowing J to rise back to its initial place. The bucket then descends along the hoist-track to make way for the next succeeding one, and K is lowered, dropping the charge into the furnace. Thus some 1700

tons of materials are charged daily into each of these furnaces without being shovelled at all, running by gravity from bin to bucket and from bucket to furnace, and being hoisted and charged into the furnace by a single engineer below, without any assistance or supervision at the furnace-top.

The winter stock of materials is drawn from the left-hand row of bins, and distributed over immense stock piles by means of the great crane LL (Fig. 5), which transfers it as it is needed to the row A of bins, whence it is carried to the furnace, as already explained.

B. *Handling the Molten Cast Iron.*—A great saving of labour was effected by the introduction of "pig-breaking" machines. A whole row or litter of pigs, with its sow (see *Ency. Brit.*, vol. xiii. p. 306, Fig. 24), was lifted from its moulds by a travelling crane, and placed on rollers which progressively fed it forward, one pig at a time, under a hydraulic press with three plungers, of which one broke off the sow between a given pig and its neighbour, and two others broke the pig itself into three pieces, which slid down into a car beneath. The iron is handled still more cheaply by the Uehling type of casting machine (Fig. 8), which consists essentially of a series of thin moulds, BB, carried by endless chains past the lip of a great ladle A. This pours into them the molten cast iron which it has just received direct from the blast-furnace. As the string of moulds, each thus containing a pig, moves slowly forward, the pigs solidify and cool, the more quickly because in transit they are sprayed with water, or even submerged in water in the tank EE. Arrived at the farther sheave C, the now cool pigs are dumped into a railway car. Besides a very great saving of labour, which, however, is partly counterbalanced by the cost of repairs, these machines have the great merit of making the management independent of a very trouble-some set of labourers, the hand pig-breakers, who were not only absolutely indispensable for every cast and every day, because the pig iron must be removed promptly to make way for the next succeeding cast of iron, but very difficult to replace because of the great physical endurance required.

C. *Preservation of the Furnace Walls.*—The combined fluxing and abrading action of the descending charge tends to wear away the lining of the furnace where it is hottest, which of course is near its lower end, thus changing its shape materially, lessening its efficiency, and in particular increasing its consumption of fuel. The walls therefore are now made thin, and are thoroughly cooled by water, which circulates through pipes or boxes bedded in them. Mr James Gayley's method of cooling, shown at the right-hand side of Fig. 6, is to set in the brickwork walls several horizontal rows of flat water-cooled bronze boxes, RR′, extending nearly to the interior of the furnace, and tapered so that they can readily be withdrawn and replaced in case they burn through. The brickwork may wear back to the front edges of these boxes, or even, as is shown at R′, a little farther. But in the latter case their edges still determine the effective profile of the furnace walls, since the depressions at the back of these edges become filled with carbon and scoria-ceous matter when the furnace is in normal working. Each of these rows, of which five are shown in Fig. 6, consists of a great number of short segmental boxes.

D. *Blast-furnace Gas Engines.*—The gases which escape from the top of the blast-furnace are necessarily very rich in carbonic oxide, of which they usually contain between 20 and 26 per cent., and they are thus a very valuable fuel. They have hitherto been used chiefly for heating the blast, and for raising steam not only for generating that blast, but also more lately for the rolling-mill and other engines of the establishment. But it has now been shown that these gases can be used directly in gas engines, in which they generate about four times as

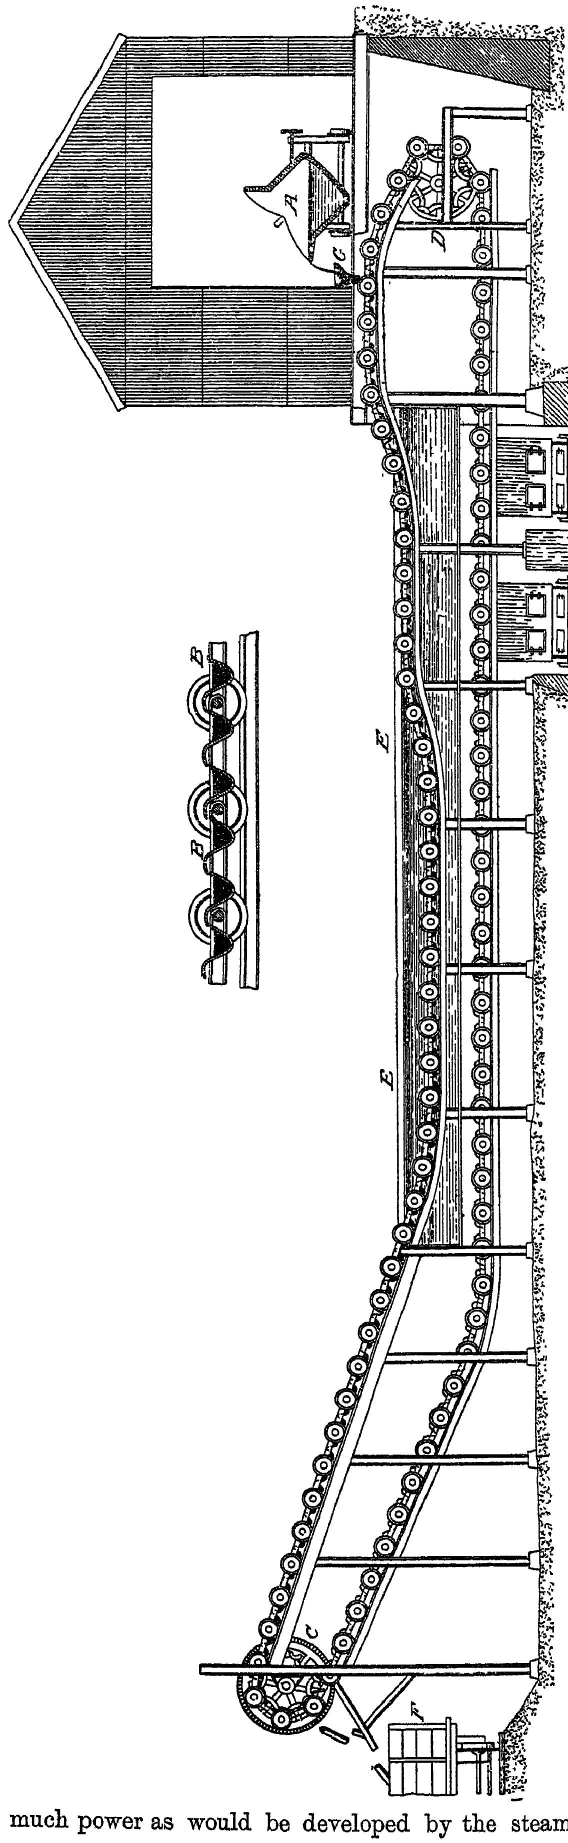

FIG. 8.—Diagram of pig-casting machine. A, ladle bringing the cast iron from the blast-furnace; BB, the moulds; C, D, sheaves carrying the endless chain of moulds; E, E, tank in which the moulds are submerged; F, car into which the cooled pigs are dropped; G, distributing funnel

much power as would be developed by the steam raised

by burning them under boilers. It has been calculated that the gas from a pair of old-fashioned blast-furnaces, making 1600 tons of iron per week, would in this way yield some 16,000 horse-power in excess of their own requirements. At that rate a pair of the great American furnaces would have some 70,000 horse-power to spare. Although the quantity may really be much less than this, because the higher efficiency of these furnaces leaves less residual calorific power in the waste gases, it is clear that their importance as sources of power is very great. This use of the gas engine is likely to have far-reaching results. In order to utilize this power, the converting, *i.e.*, steel-making, mill and the rolling-mills must adjoin the blast-furnace. The numerous converting mills which treat pig iron made at a distance will now have the crushing burden of providing in other ways the power which their rivals get from the blast-furnace, in addition to the severe disadvantage under which they already suffer, of wasting the initial heat of the molten cast iron as it runs from the blast-furnace.

E. *Hot-Blast Stoves.*—The cast iron or "pipe" stoves, in which the blast was heated by passing through a long series of cast iron pipes, around and outside which the waste gases of the blast-furnace itself were burnt, are fast going out of use, chiefly because they are destroyed quickly if an attempt is made to heat the blast above 1000° F. (538° C.). In their place the regenerative stoves of the Whitwell and Cowper (Fig. 9) types are chiefly used. With these the regular temperature of the blast at some works is about 1400° F. (760° C.), and the usual blast temperature lies between 900° and 1200° F. (480° and 650° C.).

Like the Siemens furnace, they have two distinct phases—one "on gas," during which part of the waste gas of the blast-furnace is burnt within the stove, highly heating the great surface of brickwork which for that purpose is provided within it; the other, "on wind," during which the blast is heated by passing it back over these very surfaces which have thus been heated. They are heat-filters or heat-traps for impounding the heat developed by the combustion of the furnace gas, and later returning it to the blast. Each blast-furnace is now provided with three or even four of these stoves, which collectively may be nearly thrice as large as the furnace itself. At any given time one of these is "on wind" and the others "on gas." The Whitwell stove (*Ency. Brit.*, vol. xiii. p. 304, Fig. 19) has been simplified by greatly lengthening it and reducing the number of its vertical partitions from nine to three, so that the blast, and also the gas, has only three instead of nine reversals of direction, and the blowing engines have just so much less frictional resistance to overcome. The necessary heating surface is given by three high partitions instead of by nine short ones. The Cowper stove (Fig. 9) differs from the Whitwell (1) in having not a series of flat smooth walls, but a great number of narrow vertical flues, for the alternate absorption and emission of the heat, with the consequence that, for given outside dimensions, it offers about one-half more heating surface than the Whitwell stove; and (2) in that the gas and the blast pass only once up and once down through it, instead of twice up and twice down as in the modern Whitwell stoves. As regards frictional resistance, this smaller number of reversals of direction compensates in a measure for the smaller size of its flues. The large combustion chamber B permits thorough combustion of the gas.

F. *The Increase in the Rate of Production* per furnace has been extraordinary. In 1863 a daily production of 50 tons per furnace, and in 1880 one of 115 tons, was unusually large; but in 1898 one of the

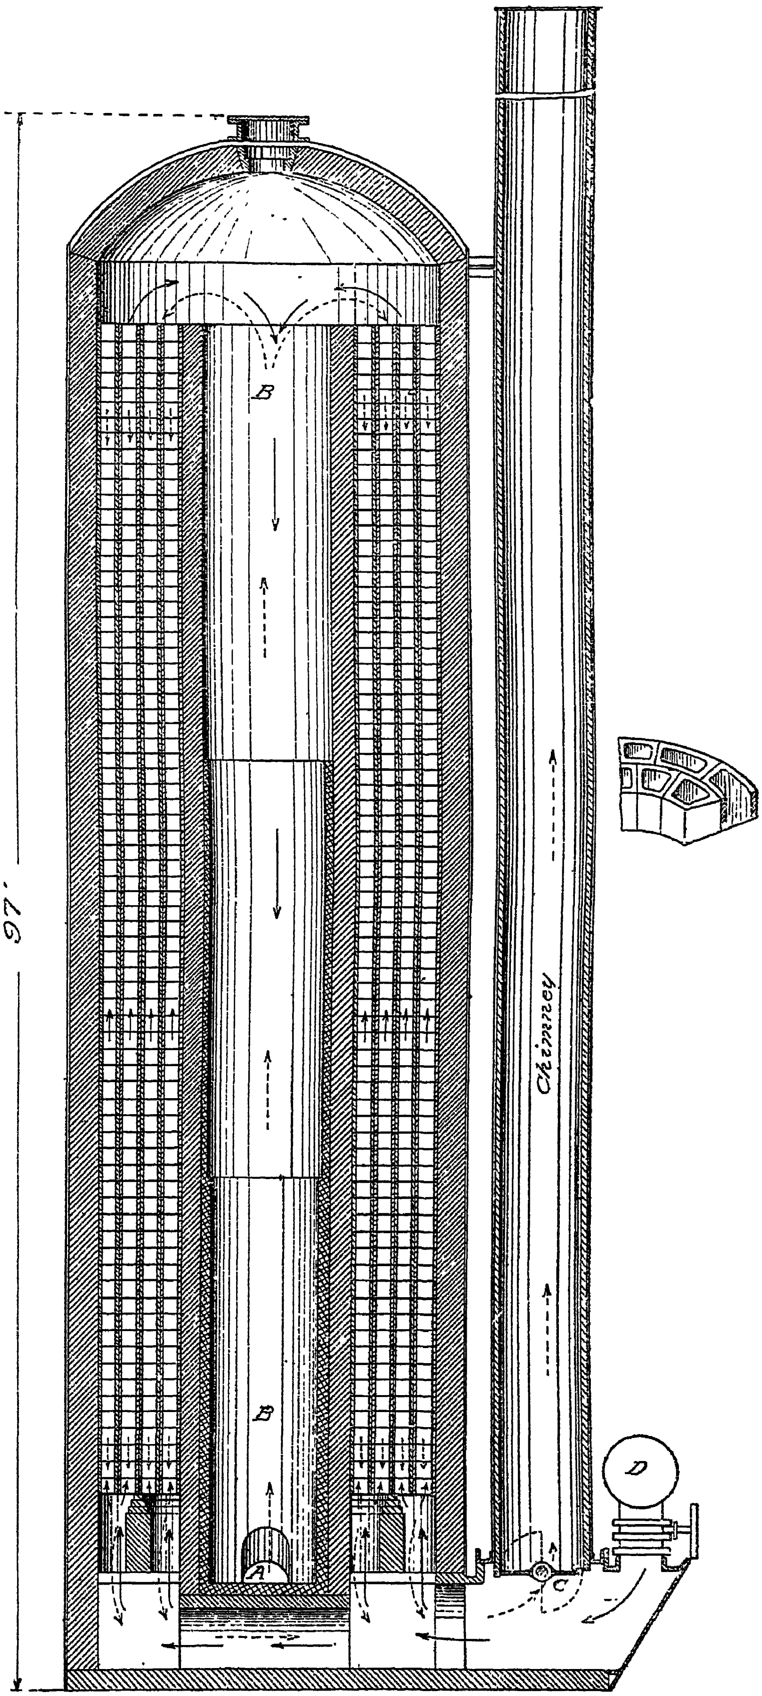

Fig. 9.—Diagram of Cowper hot-blast stove at Duquesne. (After J. Kennedy.) A, entrance for blast-furnace gas; B, B, combustion chamber; C, chimney valve; D, cold blast main. Broken arrows show the path of the gas and air while the stove is "on gas," and solid arrows that of the blast while it is "on wind."

Duquesne furnaces made 711 tons in a day, and the four furnaces there were making regularly between 2200 and 2300 tons daily, a rate as great as that of the whole world in 1800, and half as great as that of all the United States furnaces collectively in 1870. The rate of output of a single one of these furnaces is much greater than that of all the United States furnaces in 1830, about ten times that of 1820, and nearly four times that of the 153 furnaces in the United States in 1810. These Carnegie furnaces of course are exceptional ones, and the common rate of production, especially in case of European furnaces, is much less. For instance, the average daily production in the eighty-five existing and projected furnaces of Lorraine and Luxemburg is estimated at only 127 tons, and the greatest estimated daily production for any of those now building is only 200 tons. Indeed, it is questioned whether the rapid driving at Duquesne, with its rich Lake Superior ores, would be economical if applied to the lean Minette ores of Luxemburg and Lorraine. The remarkable increase since 1880 has been brought about, not chiefly by the use of larger furnaces, although the hearth or crucible is made somewhat wider than formerly, but by providing very powerful engines and hot-blast stoves; and it has almost forced the adoption of simple mechanical arrangements for handling rapidly both the raw materials and the products of the furnace. Between 1880 and 1899 the importance of anthracite as a fuel for iron smelting decreased greatly and that of charcoal very greatly; thus of the total United States product of pig iron, the percentage made with anthracite decreased in this period from 42 to 12, and that made with charcoal from 13 to 2 (see Table VI.).

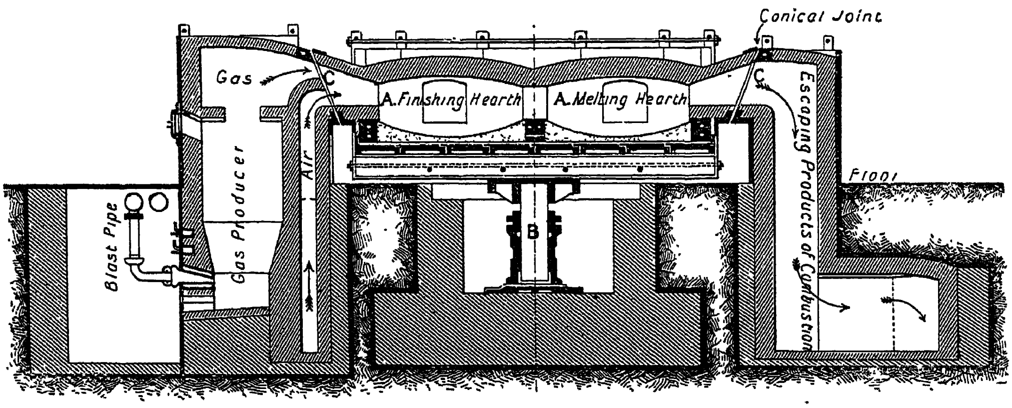

FIG. 10.—Diagrammatic section of the Pietzka puddling furnace.

III. CONVERSION INTO WROUGHT IRON AND STEEL.

§ 7. *Manufacture of Wrought Iron.*—That wrought iron, which in 1880 seemed about to be completely displaced by mild steel, remains in very extensive use is due chiefly (1) to the conservatism, often reasonable, of certain consumers, (2) to the great ease with which it welds, and (3) to the great purity which can readily be given to it. Thus wrought iron horse-shoes, bars, &c., are made in great quantities for country smiths and others who have had no opportunity to learn the slightly different treatment which mild steel needs. Welded steam, gas, and water pipes also are still often made of wrought iron instead of steel, because here thoroughness of welding is of the first importance, and because if steel for pipes is made sufficiently free from carbon to weld readily, special care is needed to prevent cavities called "blow-holes" (see § 12), due to the escape of gas from the steel when the ingots into which it is initially cast are solidifying. These blow-holes are liable either to aggravate the effects of rusting by causing local pitting, or to injure the soundness of the thread which is cut at the end of each length of pipe. As a material for making the better classes of tool steel by remelting by the crucible process, wrought iron is preferred to mild steel, both because it can be made freer than mild steel from certain elements, especially manganese, which are here undesirable, and because the crucible steel made from it is, in the opinion of the best judges, better than that made from mild steel even if of like composition, though why this is so has not been convincingly explained. For the former of these reasons, too, and perhaps also because of its very defect of being laminated by the presence of cinder, wrought iron is more ductile than mild steel under certain special conditions of use, such as those of rivets and horse-shoe nails, many of which are made of it.

While the yearly production of wrought iron in the United States more than doubled between 1870 and 1890, yet since the latter year it has shrunk very much, probably nearly to that of 1870; and between 1870 and 1900 the proportion which the production of wrought iron bears to that of steel diminished very greatly. Of the combined annual production of wrought iron and steel in the United States, that of wrought iron formed 95 per cent. in 1870, 63 per cent. in 1880, 37 per cent. in 1890, and probably not far from 15 per cent. in 1899. The corresponding numbers for Great Britain are 34 per cent. for 1890, and 19 per cent. for 1899, in which year the average number of British puddling furnaces in operation is reported as 1149 out of a total of 1320 in existence. Thus in nineteen years the position of wrought iron changed from that of the chief product to one of secondary importance.

The *Puddling Process* still supplies nearly all the wrought iron made. The numerous mechanical puddling furnaces which in 1880 or thereabouts were offered so prominently as means of lessening the very severe labour of the puddler have for the most part disappeared, even the Danks furnace being now almost forgotten, and puddling is now usually done by hand in the old-fashioned furnaces and in the same way as formerly. The novelties in puddling which here need notice are (1) the Pietzka furnace, (2) a tentative increase in the size of charges treated, and (3) the use of "direct metal," *i.e.*, molten cast iron direct from the blast-furnace.

A much lower temperature is needed during the early part of the puddling process, in which the initial charge of cast iron, a relatively fusible substance, is melted down, than towards the end, when the resultant relatively infusible wrought iron must be very highly heated so that its particles may be welded firmly together, and the cinder be so fluid that the greater part of it may readily be squeezed out of the puddled ball. The *Pietzka furnace* (Fig. 10) is designed to meet this condition, by having two separate "hearths" or working chambers, A, A, in the right-hand or cooler of which a new charge is melted down and puddling is begun, while in the left-hand hearth, which

is hotter because nearer the fire, another charge is finishing. As soon as this latter charge has been drawn from the furnace and the necessary repairs have been made, the two hearths are made to change places, being lifted by means of the hydraulic plunger B, and rotated 180° about this plunger as an axis. This brings to the hot end of the furnace the charge of which the treatment has been begun at the cooler end. To permit this rotation the joints C, between the rotating parts of the furnace and the fixed parts, may be made conical. In effect the heat, which in a common puddling furnace would escape directly from the working chamber into the chimney and thus be lost, is here used in the right-hand or cooler hearth for the early part of the process itself. Beyond this, the heat in the escaping products of combustion may be further recovered by the Siemens regenerative or by the recuperative system. Thus arranged, the Pietzka furnace effects a great saving of fuel.

In common practice the cast iron as it runs from the blast-furnace is allowed to solidify and cool completely in the form of pigs, which are then graded by their fracture, and remelted in the puddling furnace itself. At Hourpes, in order to save the expense of this remelting, the molten cast iron as it comes from the blast-furnace is poured directly into the puddling furnace, in large charges of about 2200 pounds, which are thus about four times as large as those of common puddling furnaces. These large charges are puddled by two gangs of four men each, and a great saving in fuel and labour is effected.

Attractive as are these advances in puddling, they have not been widely adopted, for two chief reasons: First, owners of puddling works have been reluctant to spend money freely in plant for a process of which the future is so uncertain, and this unwillingness has been the more natural because these very men are in large part the more conservative fraction, which has resisted the temptation to abandon puddling and adopt the steel-making processes. Second, in puddling iron which is to be used as a raw material for making very fine steel by the crucible process, quality is the thing of first importance. Now in the series of operations, the blast-furnace, puddling, and crucible processes, through which the iron passes from the state of ore to that of crucible tool steel, it is so difficult to detect just which are the conditions essential to excellence in the final product that, once a given procedure has been found to yield excellent steel, every one of its details is adhered to by the more cautious ironmasters, often with surprising conservatism. Buyers of certain excellent classes of Swedish iron have been said even to object to the substitution of electricity for water-power as a means of driving the machinery of the forge. In case of direct puddling and the use of larger charges this conservatism is reasonable, for the established custom of allowing the cast iron to solidify gives a better opportunity of examining its fracture, and thus of rejecting unsuitable iron, than is afforded in direct puddling. So, too, when several puddlers are jointly responsible for the thoroughness of their work, as happens in puddling large charges, they will not exercise such care (nor indeed will a given degree of care be so effective) as when responsibility for each charge rests on one man.

§ 8. In the *Siemens-Martin Process*, now more often called the *open-hearth process*, the advances have been more important than those in any other branch of steel making. The chief of them are: (1) the wide use of a basic lining and basic slag, so that the process removes phosphorus from the iron; (2) a great increase in the size of furnaces, from 10 to 50 and even 100 tons capacity; (3) the use of tilting furnaces; and (4) special modes of procedure.

In 1880 the radical defect of the open-hearth process, like that of the Bessemer process, was that it did not remove phosphorus, of which nearly all pig irons contain more than is desirable, and most of them more than is permissible, in steel. The essence of both these processes is the removal, by oxidation, of the impurities—carbon, silicon, manganese, &c.—which the molten cast iron contains. Phosphorus also may be oxidized by means of iron oxide, forming phosphoric acid, which separates from the molten metal and combines with the slag floating upon it. Phosphoric acid, however, is here so unstable that it tends strongly to be again deoxidized, as fast as it is formed, by the carbon and silicon of the molten iron beneath, or even by the molten iron itself, and, when so deoxidized, it immediately re-unites with that iron, so that in effect dephosphorization is wholly prevented. This strong tendency to instantaneous and complete "rephosphorization" must be counteracted if the removal of phosphorus is to be effective, and to make that possible the slag must be made strongly retentive of phosphoric acid. This is its condition only when it contains an excess of powerful bases, such as lime and iron oxide, for these, so long as they are in excess, form with the phosphoric acid salts so stable as to resist the deoxidizing action of the molten metal beneath. Silica, or silicic acid, here plays the part of an acid so powerful that, if there be more than some 20 per cent. of it in the slag, it enfeebles the hold of these bases on the phosphoric acid, with the result that much of this substance is reduced to phosphorus, and consequently re-absorbed by the molten metal. To exclude silica the furnace walls, which under other conditions are usually made of sand or clay, are here made either of a neutral substance, chromite (FeO, Cr_2O_3), or of a basic and yet infusible one, such as magnesia or the mixture of magnesia and lime which results from calcining dolomite $(Ca, Mg)CO_3$. This, when mixed with some 10 per cent. of dehydrated coal tar, is coked by the heat of the furnace into a hard ringing mass, which is much more resistant than a silicious lining, so that the basic process is actually easier to conduct than the older or "acid" process with its acid, *i.e.*, silicious, walls and slag. The basic variety has reached great importance in Germany, and in America 70 per cent. of the total of open-hearth steel is made by it, though in Great Britain the proportion is only 10 per cent.

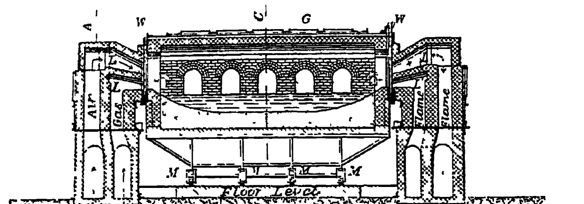
Furnaces, each treating a charge of 50 tons — five times the weight common in 1880 — have proved so economical that one of 75 tons has been built; and this has proved so completely successful that one of 100 tons capacity is building. No special difficulties have arisen in the use of these enormous furnaces. The gas and the air each enter the furnace through a single port, yielding a flame so great and long as to fill the whole melting chamber.

Many of these large furnaces are tilted at the end of each charge, as shown by the arrows in Fig. 13, so as to pour the molten steel into the casting-ladle and the molten slag into its receptacle; thus the troublesome operation of pouring is brought under much better control. This and the other incidental advantages of tilting are much more important in the basic than in the acid process, but even in the former case it is not generally conceded that the tilting system has yet been so perfected as to make its advantages considerably outweigh its greater cost for installation and repairs.

Figs. 11 to 14 are intended to explain not only the tilting furnace, but the general principle of the Siemens furnace. The charge of metal is melted and brought to the desired composition and temperature in the working chamber or body of the furnace, G, a long quasi-cylindrical vessel of brickwork, heated by burning within it preheated gas with preheated air. This working chamber is the furnace proper, in which the whole of the open-hearth process is carried out, and the function of all the rest of the apparatus, apart from the tilting mechanism, is simply to preheat the air and gas, and to lead them to the furnace proper and thence to the chimney. How this is done may be understood more easily if Figs. 11 and 12 are regarded for a moment as forming a single diagrammatic figure instead of sections in different planes. The unbroken arrows show the direction of the incoming gas and air, the broken ones the direction of the escaping products of their combustion. The air and gas, the latter coming from the gas producers or other source, arrive through H and J respectively, and their path thence is determined by the position of the reversing

valves K and K′. In the position shown in solid lines, these valves deflect the air and gas into the left-hand pair of "regenerators," large chambers filled with fire-bricks so piled as to leave abundant free passage for the gases. These, however, are exposed

FIG. 11.—Section on EF through furnace and port ends.



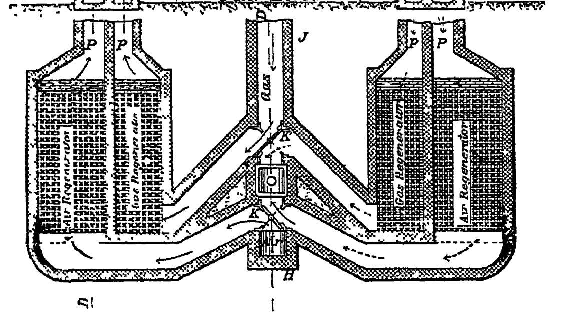


FIG. 12.—Plan through regenerators, flues, and reversing valves.

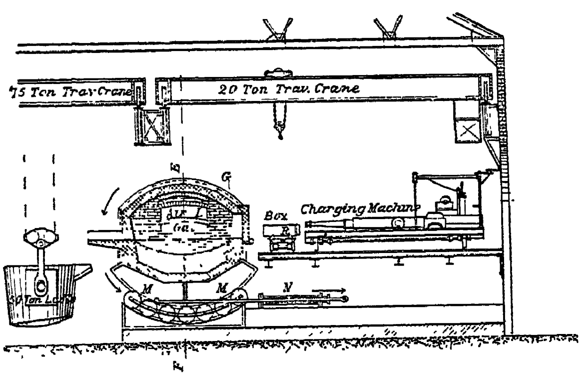

FIG. 13.—Section on CD through body of furnace.

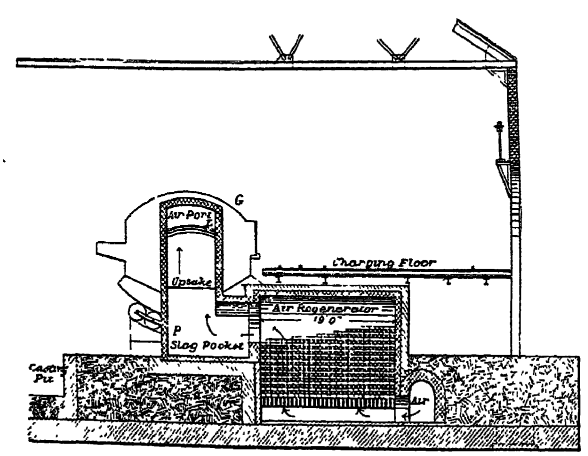

FIG. 14.—Section on AB through uptake, slag pocket, and regenerator.

Figs. 11 to 14.—Diagrammatic sections of tilting and Siemens furnaces: G, furnace body; H, air supply; J, gas supply; K, air reversing valve; K′, gas reversing valve; L, air port; L′, gas port; M, rollers on which the furnace tilts; N, hydraulic cylinder for tilting the furnace; O, flue leading to chimney; P, slag pockets; R, charging boxes; W, water-cooled joints between furnace proper, G, and ports L, L′.

to an enormous extent of brickwork surface, which we will assume for the moment has been highly preheated, so that they are heated by contact with it to a light yellow heat, say 1100° C. (2012° F.). Ascending thence as two separate streams through the uptakes (Fig. 14), they first mix at the moment of entering the working chamber through the ports L and L′ (Fig. 11). As they are so hot at starting, their combustion of course yields a very much higher temperature than if they had been cold before burning, and they form an enormous flame, which fills the great working chamber. The products of combustion are sucked by the pull of the chimney through the farther or right-hand end of this chamber, out through the exit ports, as shown by the dotted arrows, down through the right-hand pair of regenerators, heating to perhaps 1300° C. the upper part of loosely-piled masses of brickwork within them, and thence past the valves K and K′ to the chimney-flue O. During this phase the incoming gas and air have been withdrawing heat from the left-hand regenerators, which have thus been cooling down, while the escaping products of combustion have been depositing heat in the right-hand pair of regenerators, which have thus been heating up. After some thirty minutes this condition of things is reversed by turning the valves K and K′ 90° into the positions shown in dotted lines, when they deflect the incoming gas and air into the right-hand regenerators, so that they may absorb in passing the heat which has just been stored there; thence they pass up through the right-hand uptakes and ports into the working chamber, where as before they mix, burn, and heat the charge. Thence they are sucked out by the chimney-draught through the left-hand ports, down through the uptakes and regenerators, here again meeting and heating the loose mass of "regenerator" brickwork, and finally escape by the chimney-flue O. After another thirty minutes the current is again reversed to its initial direction, and so on. These regenerators are the essence of the Siemens or "regenerative furnace"; they are heat-traps, catching and storing by their enormous surface of brickwork the heat of the escaping products of combustion, and in the following phase restoring the heat to the entering air and gas. At any given moment one pair of regenerators is storing heat, while the other is restoring it.

The tilting working chamber is connected with the stationary ports L and L′ by means of the loose water-cooled joint W in Campbell's system, which is here shown. The furnace, resting on the rollers M, is tilted by the hydraulic cylinder N. The slag-pockets P (Fig. 14), below the uptakes, are provided to catch the dust carried out of the furnace proper by the escaping products of combustion, lest it enter and choke the regenerators. Wellman's tilting furnace rolls on a fixed rack instead of on rollers, and by his charging system a charge of as much as fifty tons is quickly introduced. The metal is packed by unskilled labourers in iron boxes, R (Fig. 13), standing on cars in the stock-yard. A locomotive carries a train of these cars to the track running beside a long line of open-hearth furnaces. Here the charging machine lifts one box at a time from its car, pushes it through the momentarily opened furnace door, and empties the metal upon the hearth of the furnace by inverting the box, which it then replaces on its car.

New Varieties of the Open-Hearth Process.—Cast iron differs from steel essentially in containing more carbon and silicon, and often more phosphorus; and the open-hearth process converts molten cast iron into molten steel either (1) by diluting its carbon and silicon by additions of scrap, steel, or wrought iron (*pig and scrap process*); or (2) by oxidizing its carbon and silicon, jointly by means of the oxidizing flame of the Siemens furnace, and of iron oxide added in the form of ore or scale (*pig and ore process*); or (3) by both means jointly. Because ore is usually much cheaper than scrap iron, the pig and ore process would usually be the cheaper, were it not that it must be conducted very slowly, lest the frothing due to the escape of the carbonic oxide gas, which results from the oxidation of the carbon of the metal, cause the charge to overflow. Rapid decarburization is permissible in the Bessemer process, which lasts only as many minutes as the open-hearth process lasts hours, because the Bessemer converter is very deep. Further, the cold iron ore of the pig and ore process can be introduced only very slowly, lest it chill the molten metal, both directly and because its reaction on the carbon absorbs heat; this local cooling, indeed, is what aggravates the frothing. A cold lump of ore chills the slag immediately around it, just where its oxygen reacting on the carbon of the metal generates carbonic oxide; the slag becomes cool, viscous, and froths easily just where gas is formed.

Bertrand and Thiel oxidize the carbon of molten cast iron by running it into a bath of molten iron which has first been

oxygenated, *i.e.*, charged with oxygen and superheated in an open-hearth furnace. The two metallic masses coalesce, and the reaction between the oxygen of one and the carbon of the other is therefore extremely rapid because it occurs throughout their depth, whereas in common procedure oxidation occurs only at the upper surface of the bath of cast iron at its contact with the overlying slag. Moreover, since local cooling, with its consequent viscosity and tendency to froth, are avoided, the frothing is not excessive in spite of the rapidity of the reaction. The oxygenated metal is prepared by melting cast iron diluted with as much scrap steel as is available, and oxidizing it with the flame and with iron ore as it lies in a thin molten layer on the hearth of a large open-hearth furnace; the thinness of the layer hastens the oxidation, and the large size of the furnace permits considerable frothing. But the oxygenated metal might be prepared easily in a Bessemer converter.

To enlarge the scale of operations makes strongly for economy in the open-hearth process as in other high temperature ones. (See below.) Yet the use of an open-hearth furnace of very great capacity, say of 75 or of 100 tons per charge, has the disadvantage that such very large lots of steel, delivered at relatively long intervals, are less readily managed in the subsequent operations of soaking and rolling down to the final shape, than smaller lots delivered at shorter intervals. To meet this difficulty Mr B. Talbot carries on the process as a quasi-continuous instead of an intermittent one, operating on 75- or 100-ton lots of cast iron in such a way as to draw off his steel in 20-ton lots at relatively short intervals, charging a fresh 20-ton lot of cast iron to replace each lot of steel thus drawn off. Besides minor advantages, this plan has the merit of avoiding an ineffective period which occurs in common open-hearth procedure just after the charge of cast iron has been melted down. At this time the slag is temporarily rich in iron oxide and silica, resulting from the oxidation of the iron and of its silicon as the charge slowly melts and trickles down. Such a slag not only corrodes the furnace lining, but also impedes dephosphorization, because it is irretentive of phosphorus. Further, the relatively low temperature impedes decarburization. Clearly, no such period can exist in the continuous process.

At a relatively low temperature, say 1300° C., the phosphorus of cast iron oxidizes and is removed much faster than its carbon, while at a higher temperature, say 1500° C., carbon oxidizes in preference to phosphorus. It is well to remove this latter element early, so that when the carbon shall have fallen to the proportion which the steel is to contain, the steel shall already be free from phosphorus, and so ready to cast. In common open-hearth procedure, although the temperature is low early in the process, viz., at the end of the melting down, dephosphorization is then impeded by the temporary acidity of the slag, as just explained. At the Carnegie works Mr Monell gets the two dephosphorizing conditions, low temperature and basicity of slag, early in the process, by pouring his molten but relatively cool cast iron upon a layer of preheated lime and iron oxide in the open-hearth furnace. Phosphorus is quickly removed. The ebullition from the formation of carbonic oxide puffs up the resultant phosphoric slag enough to make most of it run out of the furnace, thus both removing the phosphorus permanently from danger of being later deoxidized and returned to the steel, and partly freeing the bath of metal from the heat-insulating blanket of slag. Yet frothing is not excessive, because the slag is not, as in common practice, locally chilled and made viscous by cold lumps of ore.

None of these new modifications has been long enough in use to permit a definite estimate of its merit. In the procedures followed by Bertrand and Thiel and by Monell, the attack of the iron oxide on the basic lining of the furnace may perhaps be a source of trouble.

§ 9. *The Bessemer Process.*—The chief advances in the Bessemer process have been the use (1) of molten cast iron direct from the blast-furnace, or "direct metal"; (2) of "mixers" in which the cast iron from several blast-furnaces is mixed together, so as to equalize its composition; (3) of "car casting," or casting the molten steel in moulds standing on a train of cars. In addition to these, which are advances not in the nature but in the administration of the process, (4) the basic Bessemer or Thomas[1] process has come into extensive use (*Ency. Brit.*, vol. xiii. p. 345).

[1] Such terms as the "Bessemer-Mushet" process, the "Kelley-Bessemer" process, and the "Snelus-Thomas-Gilchrist" process are no longer in use. The Bessemer process is called after Bessemer alone, while in French and German the basic Bessemer process is called the Thomas process. While several men usually so contribute to the introduction of a process as to seem at first to have been essential to it, yet there is generally one great central figure to whom the world is chiefly indebted for its own adoption of the invention.

A. *Direct Metal and the Mixer.*—Until lately the cast iron for the Bessemer process has nearly always been allowed to solidify in pigs, which were next broken up by manual labour and remelted at great cost. It has long been seen that there should be a great saving if this remelting could be avoided and "direct metal," *i.e.*, the molten cast iron direct from the blast-furnace, be treated in the Bessemer process. The obstacle is that, owing to unavoidable irregularities in the blast-furnace process, the silicon- and sulphur-content of the cast iron vary to a degree and with an abruptness which the Bessemer process can hardly tolerate. Sulphur, which is not removed in the acid Bessemer process, injures the steel so greatly that it must be held below a limit, fixed in each case by the uses to which the steel is to be put. Further, the point at which the process should be arrested is recognized by the appearance of the flame which issues from the converter's mouth, and variations in the silicon-content of the cast iron treated alter this appearance, so that the indications of the flame become confusing, and control over the process is lost. Moreover, the quality of the resultant steel depends closely on the temperature of the process, and this in turn depends upon the proportion of silicon, the combustion of which is the chief source of the heat developed. Hence the importance of having the silicon-content constant. This difficulty was avoided at the Carnegie "Edgar Thomson" works by Captain W. R. Jones's invention of the "Mixer," which is simply a great reservoir into which successive lots of molten cast iron from all the blast-furnaces available are poured, forming a great molten mass of some two hundred or more tons. This is kept molten by a small flame playing above it, and successive lots of the cast iron thus mixed are drawn off, as they are needed, for conversion into steel by the Bessemer process. This device not only makes the cast iron much more uniform, but also removes much of its sulphur by a curious slow reaction. Many metals have the power of dissolving their own oxides and sulphides, but not those of other metals. Thus iron dissolves its own sulphide freely, but not that of either calcium or manganese. Consequently, when we deoxidize calcium in the iron blast-furnace, it greedily absorbs the sulphur which has dissolved in the iron as iron sulphide, and the sulphide of calcium thus formed separates from the iron. In like manner, if the molten iron in the mixer contains manganese, this metal unites with the sulphur present, and the manganese sulphide, insoluble in the iron, slowly rises to the surface, and there reaching the air, its sulphur oxidizes to sulphurous acid, which escapes. The use of the mixer, and through it that of direct metal, has now become general.

There still remains some irregularity in the silicon-content of the cast iron, and consequently in the temperature developed in the process, but this is met by throwing into the converter, during the process itself, a variable quantity of cold scrap steel (the crop-ends of rails and other waste pieces), and also by introducing a variable quantity of steam into the air which is blown through the molten iron. This is decomposed, with great absorption of heat and consequent lowering of the temperature, affording a most convenient way of regulating the temperature. If, on the other hand, the temperature threatens to be too low, it may be raised by so inclining the converter that the layer of metal through which the blast from certain of the tuyeres passes shall be so thin that here the blast shall oxidize much iron, which thus becomes a source of heat, though an expensive one.

B. The *Car casting* system deserves description chiefly because it shows how, when the scale of operations is as enormous as it is in the Bessemer process, even a slight simplification and a slight heat-saving may be of great economic importance.

Whatever be the form into which the steel is to be rolled, it must in general first be poured from the Bessemer converter in

which it is made into a large clay-lined ladle, and thence cast in vertical pyramidal ingots. To bring them to a temperature suitable for rolling, these ingots must be set in heating or soaking furnaces (§ 13), and this should be done as soon as possible after they are cast, both to lessen the loss of their initial heat, and to make way for the next succeeding lot of ingots, a matter of great importance, because the charges of steel follow each other at such very brief intervals. A pair of working converters has made 4958 charges of 10 tons each, or a total of 50,547 tons, in one month, or at an average rate of a charge every seven minutes and twenty-four seconds throughout every working day. It is this extraordinary rapidity that makes the process so economical and determines the way in which its details must be carried out. Moreover, since the mould acts as a covering to retard the loss of heat, it should not be removed from the ingot until just before the latter is to be placed in its soaking furnace. These conditions are fulfilled by the car casting system of Mr F. W. Wood, of Sparrows Point, Md., in which the moulds, while receiving the steel, stand on a train of cars, which are immediately run to the side of the soaking furnace. Here, as soon as the ingots have so far solidified that they can be lifted without breaking, their moulds are removed and set on an adjoining train of cars, and the ingots are charged directly into the soaking furnace. The mould-train now carries its empty moulds to a cooling yard, and, as soon as they are cool enough to be used again, carries them back to the neighbourhood of the converters to receive a new lot of steel. In this system there is for each ingot and each mould only one handling, in which it is moved as a separate unit, the mould from one train to the other, the ingot from its train into the furnace. In the other movements, all the moulds and ingots of a given charge of steel are grouped as a train, which is moved as a unit by a locomotive. The difficulty in the way of this system was that, in pouring the steel from ladle to mould, more or less of it occasionally spatters, and these spatterings, since the solidified steel is extremely tenacious, if they strike the rails or the running gear of the cars, obstruct and foul them, preventing the movement of the train. But this cannot be tolerated, because the economy of the process requires extreme promptness in each of its steps. On account of this difficulty the moulds formerly stood not on cars, but directly on the floor of a casting pit while receiving the molten steel. When the ingots had so far solidified that they could be handled, the moulds were removed and set on the floor to cool, the ingots were set on a car and carried to the soaking furnace, and the moulds were then replaced in the casting pit. Here each mould and each ingot was handled as a separate unit twice, instead of only once as in the car casting system; the ingots radiated away great quantities of heat in passing naked from the converting mill to the soaking furnaces, and the heat which they and the moulds radiated while in the converting mill was not only wasted, but made this mill, open-doored as it was, so intolerably hot, that the cost of labour there was materially increased. Mr Wood met this difficulty by the simple device of so shaping the cars that they completely protect both their own running gear and the track from all possible spattering, a device which, simple as it is, has materially lessened the cost of the steel and greatly increased the production. The following table shows how great has been this increase :—

TABLE II.

Year.	Maximum Production of Ingots by a Pair of American Converters, in gross Tons per Week.
1870	254
1880	3,433
1889	8,549
1899, for a month the average weekly production was	11,233

Thus in less than thirty years the rate of production per pair of vessels has increased forty-four-fold. The production of European Bessemer works is very much less than that of American. Indeed, the whole German production of acid Bessemer steel in 1899 was at a rate but slightly greater than that here given for one pair of American converters; and three pairs, if this rate were continued, would produce almost exactly as much steel as all the sixty-five active British Bessemer converters, acid and basic together, produced in 1899.

C. *Range in Size of Converters.*—In the Bessemer process, and indeed in most high-temperature processes, to operate on a large scale has, in addition to the usual economies which it offers in other industries, a special one, arising from the fact that from a large hot furnace or hot mass in general a very much smaller proportion of its heat dissipates through radiation and like causes than from a smaller body, just as a thin red-hot wire cools in the air much faster than a thick bar equally hot. Hence the progressive increase which has occurred in the size of converters, until now some of them can treat a 20-ton charge, is not surprising. But, on the other hand, when only a relatively small quantity of a special kind of steel is needed, very much smaller charges, in some cases weighing even less than half a ton, have been treated with technical success.

This has been particularly true in the manufacture of steel castings, *i.e.*, objects usually of more or less intricate shape, which are cast initially in the form in which they are to be used, instead of being forged or rolled to that form from steel cast originally in ingots. For making castings, especially those which are so thin and intricate that, in order that the molten steel may remain molten long enough to run into the thin parts of the mould, it must be heated initially very far above its melting-point, the Bessemer process has a very great advantage in that it can develop a much higher temperature than is attainable in either of its competitors, the crucible and the open-hearth processes. Indeed, no limit has yet been found to the temperature which can be reached, if matters be so arranged that not only the carbon and silicon of the pig iron, but also a considerable part of the metallic iron which is the iron itself, be oxidized by the blast; or if, as in the Walrand-Legenisel modification, after the combustion of the initial carbon and silicon of the pig iron has already raised the charge to a very high temperature, a still further rise of temperature is brought about by adding more silicon in the form of ferro-silicon, and oxidizing it by further blowing. But in the crucible and the open-hearth processes the temperature attainable is limited by the danger of melting the furnace itself, both because some essential parts of it, which, unfortunately, are of a destructible shape, are placed most unfavourably in that they are surrounded by the heat on all sides, and because the furnace is necessarily hotter than the steel made within it. But no part of the Bessemer converter is of a shape easily affected by the heat, no part of it has heat on more than one side, and the converter itself is necessarily cooler than the metal within it, since the heat is generated within the metal itself by the combustion of its silicon and other calorific elements. In it the steel heats the converter, whereas in the open-hearth and crucible processes the furnace heats the steel.

D. *The Basic Bessemer Process.*—The field of this process is greatly restricted by the fact that there are few ores which yield pig iron suited to it. For though there is usually neither excessive difficulty nor prohibitory expense in complying with the conditions that this iron should contain not more than 1 per cent. of silicon or 0·12 per cent. of sulphur, and preferably not less than 1·80 per cent. of manganese, yet the 1·80 per cent. of phosphorus which it imperatively needs can be supplied by but few ores. Of these the chief is the lean but very cheap "Minette" ore of the enormous deposits of Luxemburg and Lorraine, though Sweden also has deposits of phosphoric iron ore from which much is to be expected. Eighty-six per cent. of the German and Luxemburg Bessemer steel of 1899, and 28 per cent. of the British, were made by the basic process, which is important also in Belgium and Bohemia. But in the United States few phosphoric ores are so much cheaper than the non-phosphoric or "Bessemer" ores as to permit the basic process, in itself the more expensive, to compete with the original or "acid" Bessemer process. It is carried out at only one American establishment, and even there only intermittently. The *rôle* of the 1·80 per cent. of phosphorus of the pig iron is to generate, in being oxidized to phosphoric acid by the air blown through the metal, the very high temperature, about 1600° C. (2912° F.), which the process needs because of the high melting-point of its product, Bessemer steel. Silicon cannot be used here as a chief source of heat, as it is in the "acid" Bessemer process, because the resultant silica would both corrode the basic walls of the converter, and cause "rephosphorization," as explained in § 8, unless counteracted by great additions of lime, which would not only occupy precious room, but in themselves consume most of the heat generated by the oxidation of the silicon. Further, if the

silicon be much in excess of 1 per cent., it causes such frothing as to throw much of the metal out of the mouth even of these roomy converters. Manganese to the extent of 1·80 per cent. is desired as a means of preventing the resultant steel from being redshort, *i.e.*, brittle at a red or forging heat. The pig iron should be as nearly free as possible from sulphur, because the removal of any large quantity of this injurious element in the process itself is both difficult and expensive. The basic lining of the converters, made of calcined dolomite mixed with 10 per cent. of dehydrated coal tar, is expensive, and lasts but relatively few charges—in few works more than 200, and in some only 100—while the silicious lining of the acid converter lasts thousands of charges. Hence, for the basic process, spare converters must be provided, so that there may always be some of them re-lining, either while standing in the same place as when in commission, or, as in Holley's arrangement, in a separate repair house, to which these gigantic vessels are removed bodily. The slag of the process usually contains about 18 per cent. of phosphoric acid, and on this account it is so valuable a fertilizer as to be a most important bye-product. Its percentage composition is approximately as follows :—

Phosphoric Acid.	Silica.	Lime.	Magnesia.	Ferrous Oxide.
16 to 19	6 to 9	50	3	13

In order that the phosphoric acid may be the more fully liberated by the humic acid, &c., of the earth, a little silicious sand is mixed with the still molten slag after it has been poured off from the molten steel. The slag is used in agriculture with no further preparation, save very fine grinding.

§ 10. *Darby's Recarburizing Process.* — In the basic Bessemer process most of the phosphorus is not removed until after the carbon, probably because the lime, which is charged in solid lumps, melts and enters the slag so slowly that not until late in the operation does the slag become so basic as to be retentive of phosphoric acid. Hence in making steel rich in carbon it is not possible, as in the acid Bessemer process, to end the operation as soon as the carbon in the metal has fallen to the point sought, but it is necessary to remove practically all of the carbon, then the phosphorus, and then "recarburize," *i.e.*, add whatever carbon the steel is to contain. On account of certain objections to adding this carbon in the form of cast iron, Darby adds gas-carbon, coke, or other carbonaceous matter, which is absorbed greedily by the molten steel. This process, which in careful hands yields regular results, is much used in connexion with the basic open-hearth process, though indeed it can be used with either the acid or basic variety of the Bessemer and of the open-hearth process.

§ 11. *Comparison of Processes.*—The puddling process, often preceded by the removal of silicon in the "refinery" process, is still widely used for making wrought iron for certain normal purposes which need great ease in welding; for purposes requiring special forms of extreme ductility which are not so confidently expected in steel; for miscellaneous purposes by many users, some ignorant, some very conservative; and for remelting in the crucible process. All the best cutlery and tool steel is made by the crucible process, and indeed all for which any considerable excellence is claimed is supposed to be, though often incorrectly. But the great mass of steel is made by the Bessemer and the open-hearth processes. Open-hearth steel is generally considered better than Bessemer, and the acid variety of each of these two processes is thought to yield a better product than the basic variety. Probably this is not necessarily true, but the acid variety lends itself more readily to excellence than the basic. A very large proportion of ores cannot be made to yield cast iron either free enough from phosphorus for the acid Bessemer or the acid open-hearth process, neither of which removes that most injurious element, or rich enough in phosphorus for the basic Bessemer process, which must rely on that element as its source of heat. But cast iron for the basic open-hearth process can be made from almost any ore, since its requirements, comparative freedom from silicon and sulphur, depend on the management of the blast-furnace rather than on the composition of the ore, whereas the phosphorus-content of the cast iron depends solely on that of the ore, since nearly all the phosphorus of the ore necessarily passes into the cast iron. Thus the basic open-hearth process is the only one which can make steel from cast iron containing more than 0·10 per cent. but less than 1·80 per cent. of phosphorus. In cost of conversion the acid Bessemer process is the cheapest, the basic Bessemer next, and the basic open-hearth next, though the difference is not very great. The crucible process, however, is far more expensive than any of the others. Rail steel is almost always made by either the acid or the basic Bessemer process. Between 1880 and 1899 the yearly production of open-hearth steel advanced in the United States from 9 to 39 per cent. of that of Bessemer steel, and in Great Britain from 24 to 166 per cent. In the three great iron-making countries taken collectively, Great Britain, the United States, and Germany and Luxemburg, between 1880 and 1899 the production of acid open-hearth steel increased sevenfold, that of all open-hearth steel sixteenfold, that of the acid Bessemer process more than tripled, the total production of the Bessemer converter increased fourfold, the total production of steel fivefold, and the basic open-hearth and the basic Bessemer process, which were merely beginning to be used in 1880, in 1899 each produced about as much steel as the whole world produced by all processes in 1880. In these countries in 1899, 43 per cent. of the total steel production was made by the acid Bessemer process, 20 per cent. by the basic Bessemer, 16½ per cent. by the acid open-hearth, 18½ per cent. by the basic open-hearth, and a little over 1 per cent. by the crucible and other processes.

IV. MECHANICAL TREATMENT.

§ 12. *Defects in Steel Ingots.*—These are of three chief classes—pipes, blowholes, and segregation. When molten steel is cast in an ingot in a cold cast iron mould, its outer crust solidifies and cools so far as to be rigid and incompressible, at a time, T, when much of the interior is still molten. In the further cooling the molten interior, because it is at this moment, T, so much hotter than the exterior, has a greater range of temperature to pass through before becoming completely cold; and for this reason the interior will undergo more contraction than the exterior. But since the interior just filled the exterior at the moment T, it will not be large enough to fill it completely after it has undergone this excess of contraction. In particular, the interior undergoes much of this excess of contraction between the time T and the time T′ when the last of the interior itself solidifies. Consequently at T′ the solidifying interior no longer suffices to fill the outer crust; and on this account a deep pear-shaped contraction cavity or *pipe* is formed, as shown at C in Fig. 15.

Since this pipe is due to the difference in the rates of contraction of interior and exterior, it may be lessened by retarding the cooling of the mass as a whole, and it may be prevented from stretching down deep by retarding the solidification of the upper part of the ingot, as, for instance, by preheating the top of the mould, or by

covering the ingot with a great mass of burning fuel or of molten slag. This keeps the upper part of the mass molten, so that it continues to flow down and feed the pipe during the early part of its formation in the lower and quicker-cooling part of the ingot. In making castings of steel, this same difficulty arises; and much of the steel-founder's skill consists either in preventing these pipes, or in so placing them that they shall not occur in the finished casting, or at least not in a harmful position. In making armour-plates from steel ingots, as much as 40 per cent. of the metal may be rejected as unsound from this cause. An ingot should always stand upright while solidifying, so that the unsound region due to the pipe may readily be cut off, leaving the rest of the ingot solid. If the ingot lay on its side while solidifying, the pipe would occur as shown in Fig. 16, and nearly the whole length of the ingot would be rendered unsound.

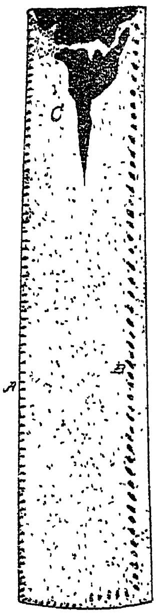

FIG 15.—Diagram showing how a pipe is formed. A, superficial blowholes; B, deep-seated blowholes; C, pipe.

Iron, like water and many other substances, has a higher solvent power for gases, such as hydrogen and nitrogen, when molten, *i.e.*, liquid, than when frozen, *i.e.*, solid. Hence in the act of solidifying it expels any excess of gas which it has dissolved while liquid, and this gas becomes entangled in the freezing mass, causing gas bubbles or *blowholes*, as at A and B in Fig. 15. Since the volume of the pipe represents the excess of the contraction of the interior between T and T′, any space within the ingot-crust occupied by blowholes must diminish by just so much the volume of the pipe, so that the more and larger the blowholes are, the smaller will the pipe be. The interior surface of a blowhole which lies near the outer crust of the ingot, as at A, is liable to become oxidized by the diffusion of the atmospheric oxygen, in which case it can hardly be completely welded later, since welding implies actual contact of metal with metal; it thus forms a permanent flaw. But deep-seated blowholes like those at B are relatively harmless, because the subsequent operation of forging or rolling usually obliterates them by welding their sides firmly together.

Blowholes may be lessened or even wholly prevented by adding to the molten metal shortly before it solidifies either silicon or aluminium, or both; even as little as 0·002 per cent. of aluminium is usually sufficient. These additions seem to act in part by deoxidizing the minute quantity of iron oxide and carbonic oxide present, in part by increasing the solvent power of the metal for gas, so that even after freezing it can retain in solution the gas which it had dissolved when molten. But, since preventing blowholes increases the volume of the pipe, it is often better to allow them to form, but to control their position, so that they shall be deep-seated. This is done chiefly by casting the steel at a relatively low temperature, and by limiting the quantity of manganese and silicon which it contains. Brinell finds that, for certain normal conditions, if the sum of the percentage of manganese plus 5·2 times that of the silicon equal 1·66, there will be no blowholes; if this sum be less, blowholes will occur, and will be injuriously near the surface unless this sum be reduced to 0·28. He thus finds that this sum should be either as great as 1·66, so that blowholes shall be absent; or as low as 0·28, so that they shall be harmlessly deep-seated. These numbers must be varied with the variations in other conditions, such as casting temperature, rapidity of solidification, &c.

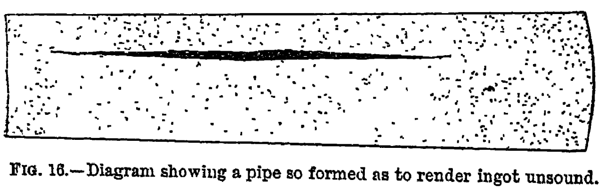

FIG. 16.—Diagram showing a pipe so formed as to render ingot unsound.

The solidification of a large ingot of steel takes place gradually from without inwards, and each layer in solidifying tends to expel into the still molten interior the impurities which it contains, especially the carbon, phosphorus, and sulphur, which by this process are in part concentrated or *segregated* in the last-freezing part of the ingot. This is in general around the lower part of the pipe, so that here is a second motive for rejecting the piped part of the ingot. While segregation injures the metal here, often fatally, by giving it an indeterminate excess of phosphorus and sulphur, it clearly purifies the remainder of the ingot, and on this account it ought, under certain conditions, to be promoted rather than restrained. The following is an extreme case:—

	Carbon	Silicon.	Manganese.	Phosphorus.	Sulphur.
Composition of the initial metal per cent.	0·24	0·336	0·97	0·089	0·074
Composition of the segregation . .	1·27	0·41	1·08	0·753	0·418

§ 13. *Heating Furnaces.*—The introduction of the "soaking" or Gjers pit and the development of the continuous or Eckman type of furnace have been of great importance. When the outer crust of a large ingot in which a lot of molten steel has been cast has so far

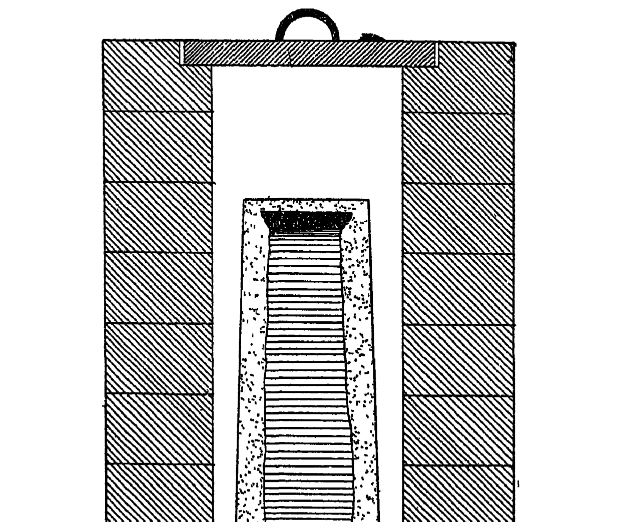

FIG. 17.—Section of Gjers soaking pit.

cooled that it can be moved without breaking, the temperature of the interior is still far above that suitable for rolling or hammering—so far above it that the surplus heat of the interior would more than suffice to reheat the now cool crust to the rolling temperature, if we could only arrest or even greatly retard the further escape of heat from that crust. Bringing such an ingot, then, to the rolling temperature is not really an operation of heating, since its average temperature is already above the rolling temperature, but one of equalizing the temperature, by allowing

the internal excess of heat to "soak" through the mass. Gjers did this by setting the partly-solidified ingot in a well-closed "pit" of brickwork, preheated by the excess heat of previous lots of ingots. The arrangement, shown in Fig. 17, has three advantages—(1) that the temperature is adjusted with absolutely no consumption of fuel; (2) that the waste of iron due to the oxidation of the outer crust of the ingot is very slight, since the little atmospheric oxygen initially in the pit is not renewed, whereas in a common heating furnace the flame brings a constant fresh supply of oxygen; and (3) that the ingot remains upright during solidification, so that its pipe is concentrated at one end and is thus removable. (See § 12.) In this form the system is rather inflexible, for if the supply of ingots be delayed the pits grow unduly cool, so that the next ensuing lot of ingots either is not heated hot enough or is delayed too long in soaking. This defect is usually remedied by heating the pits by the Siemens regenerative system (see § 8); the greater flexibility thus gained outweighs the cost of the fuel used and the increased loss of iron by oxidation by the Siemens gas flame.

The Gjers system is not applicable to small ingots or "billets,"[1] because they lack the inner surplus heat of large ingots; indeed, they are now allowed to cool completely. To heat these on the intermittent plan for further rolling, *i.e.*, to charge a lot of them as a whole in a heating furnace, bring them as a whole to rolling

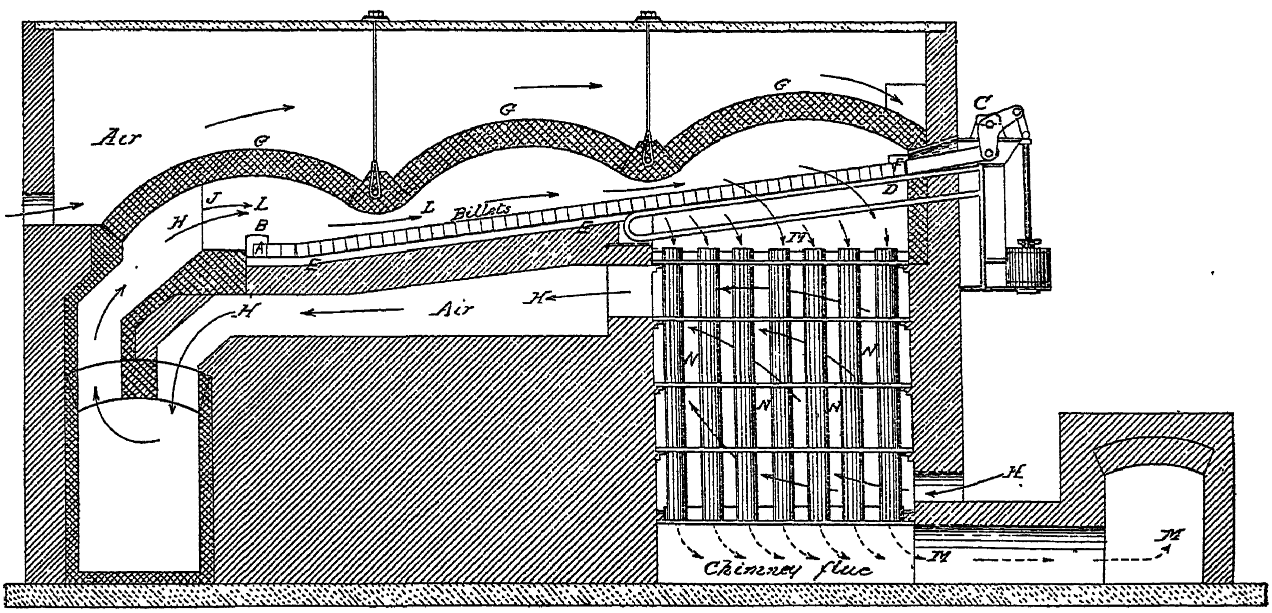

Fig. 18.—Diagram of C. H. Morgan's continuous heating furnace for 2-inch billets 30 feet long.

A, hottest billet ready for rolling; B, exit door; C, pusher, for forcing billets forward; D, water-cooled pipe on which billets are pushed forward; E, magnesite bricks on which the hot billets slide forward; F, the billet last entered; G, the suspended roof; H, the incoming air preheated by G and by the pipes N; J, the incoming gas; L, the flame; M, the escaping products of combustion; N, pipes through which the products of combustion pass.

temperature, and then withdraw them as a whole for rolling, is very wasteful of heat, because it is only in the first part of the heating that the outside of the ingots is cool enough to abstract thoroughly the heat from the flame; during all the latter part of the heating, when the temperature of the ingot has approached that of the flame, only an ever smaller and smaller part of the heat of that flame can be absorbed by the ingots. Hence in the intermittent system most of the heat generated within the furnace escapes from it with the products of combustion. The continuous heating system (Fig. 18) recovers this heat by bringing the flame into contact with successively cooler and cooler billets, A–F, and finally with quite cold ones, of consequently great heat-absorbing capacity.

As soon as a hot billet A is withdrawn by pushing it endwise out of the exit door B, the whole row is pushed forward by a set of mechanical pushers C, the billets sliding on the raised water-cooled pipes D, and, in the hotter part of the furnace, on the magnesite bricks E, on which iron slides easily when red-hot. A new cold billet is then charged at the upper end of the hearth, and the cycle begins by pushing out through B a second billet, and so forth. To lessen the loss in shape of "crop ends," and for general economy, these billets are in some cases 30 feet long, as in the furnace shown in Fig. 18. It is to make it wide enough to receive such long billets that its roof is suspended, as here shown, by two sets of iron tie-rods. As the foremost end of the billet emerges from the furnace it enters the first of a series of roll-trains, and passes immediately thence to others, so that before half of the billet has emerged from the furnace its front end has already been reduced by rolling to its final shape, that of merchant-bars, which are relatively thin, round, or square rods, in lengths of 300 feet.

In the intermittent system the waste heat can, it is true, be utilized either for raising steam (but inefficiently and inconveniently, because of the intermittency), or by a regenerative method like the Siemens; but this would probably recover less heat than the continuous system, first, because it transfers the heat from flame to metal indirectly instead of directly; and, second, because the brickwork of the Siemens system is probably a poorer heat-catcher than the iron billets of the continuous system, its disadvantages of low conductivity and low specific heat probably outweighing its advantages of roughness and porosity.

§ 14. *The Continuous Rolling-Mill.*—The use of the continuous or Bedson type of rolling-mill has been much extended, so that it receives billets as large as 4 by $5\frac{3}{4}$ inches, and rolls sheets, skelp, merchant-bars, cotton-ties, and other important products. In this system several roll-trains stand one behind another in column, so that the forward end of a given steel billet which is under treatment passes immediately from one pair of rolls into the next, and so on, and emerges from the last reduced to a diameter of say three-quarters of an inch, before the rear end of the same billet has entered the first pair of rolls, or indeed has emerged from the furnace in which it has been heated for rolling. By practically eliminating

[1] Billets are bars from 2 to 6 inches square, an intermediate product into which large ingots are rolled, to be further rolled into wire rods, sheets, small round and square rods, &c.

the loss of time between the successive reductions, large billets can be rolled at one operation into small rods of great length, so that the proportion of metal wasted in the form of crop ends is greatly reduced. Once the rod is so very thin as to be flexible, further reduction may be made by the Belgian system, in which the successive roll-trains stand in line instead of in column, and the front end of the rod as it emerges from one pair of rolls is turned 180° in a loop by hand or mechanism, and so returned to undergo another pass in the same train. By a combination of these two systems, as developed by C. H. Morgan and W. Garrett respectively, billets 3 inches square are rolled at one operation into bars three-quarters of an inch in diameter and about 230 feet long.

§ 15. *Hammers and Hydraulic Presses.*—The demand for very large forgings, especially for armour-plate and ordnance, has led to the erection of enormous steam-hammers. The falling parts of the largest of these, that at Bethlehem, Pa., weigh 125 tons. But even so great a hammer is an ineffective tool for making large forgings, chiefly because the effect of its blow is concentrated on the outside of the forging, and does not penetrate well towards the interior; indeed, the days of large hammers seem to be over. The use of this particular one has been abandoned for that of an enormous hydraulic press which exerts a pressure of 14,000 tons. It is moved by water under a pressure of 7000 pounds per square inch, supplied by pumps of 16,000 horse-power. For forging shafting and other objects not readily made in rolling-mills, because their cross-section is not uniform, the hydraulic press seems to be firmly established as by far the most efficient tool. But though the great 14,000-ton Bethlehem press is used with great success for forging armour-plate also, the rolling-mill certainly has special merits for such a purpose, and with it all of Krupp's armour-plate is now made. The rolls of this great armour-plate mill are 4 feet in diameter and 12 feet long, and can receive an ingot 4 feet thick.

V. Statistics.

§ 16. *Cost of Manufacture.*—There has been a remarkable reduction in the cost of iron and steel manufacture, a few examples of which, taken from American practice, are given in Table III. Here we find a reduction of some 35 per cent. in total cost and an even greater reduction in the cost of labour, reaching in one case even 54 per cent. in a period of from seven to ten years. The reduction in the cost of labour has been brought about by improvements in administration and by mechanical appliances, and not by reduction of wages. According to Mr Carnegie, in one of the largest American steel works the average wages in 1900 for all persons paid by the day, including labourers, mechanics, and boys, were more than $4 (say 16s. 6d.) a day for the 311 working days. How economical the methods of mining, transportation, and manufacture have become is shown by the fact that steel billets have been sold at $13·96 (£2, 17s. 8d.) per ton, and in very large quantities at $15 (£3, 2s.) per ton, in the latter case, according to Mr Carnegie, without further loss than that represented by interest, although the cost of each ton includes that of mining 2 tons of ore and carrying them 1000 miles, mining and coking 1·3 tons of coal and carrying its coke 50 miles, and quarrying one-third of a ton of limestone and carrying it 140 miles, besides the cost of smelting the ore, converting the resultant cast iron into steel, and rolling that steel into rails.

Table IV. shows the reduction in prices. The price of wrought iron in Philadelphia reached $155 (£32, 0s. 8d.) in 1815, and, after declining to $80 (£16, 10s. 8d.), again reached $115 (£23, 15s. 4d.) in 1837. Bessemer steel rails sold at $174 in the depreciated currency of 1868 (equivalent to about £25, 17s. 4d. in gold), and at $17 (£3, 10s. 3d.) in 1898.

VI. Increase in Production.

§ 17. In 1810 the United States made about 7 per cent., and in 1830, 1850, and 1860 not far from 10 per cent. of the world's production of pig iron, though, indeed, in 1820 their production was only about one-third as great as in 1810. But after the close of the Civil War the production increased by leaps and bounds, till in 1899 it was sixteen times as great as in 1865; and the percentage which it formed of the world's production rose to some 14 per cent. in 1870, 21 per cent. in 1880, and 34 per cent. in 1899. Between 1880 and 1899, though the British production increased only 20 per cent., that of the United States more than tripled, that of Germany and Luxemburg nearly tripled, and that of the world more than doubled. The corresponding changes in case of steel are even more striking. The United States production in 1899 was nearly 800 times that of 1865; and the proportion of the world's steel which it formed rose from 3 per cent. in 1865 to 10 per cent. in 1870, 30 per cent. in 1880, 36 per cent. in 1890, and 40 per cent. in 1899. Between 1880 and 1899 the production of Great Britain

has increased to nearly four times, and that of the United States to eight and a half times, their respective productions in 1880. As has been already indicated, of the combined wrought iron and steel of the United States, steel formed 2 per cent. in 1865, 37 per cent. in 1880, but about 85 per cent. in 1899. The age of iron has in these nineteen years given place to the age of steel.

The *per capita* consumption of iron in Great Britain, excluding exports, has been calculated as 144 pounds in 1855 and 250 pounds in 1890, that of the United States as 117 pounds for 1855, 300 pounds for 1890, and some 378 pounds for 1899, or more than thrice that of 1855. Among the chief causes of this increase in the consumption of iron by the human race we may recognize, in addition to the general advance in wealth and civilization, the increasing diversion of mankind from agricultural to manufacturing, *i.e.*, machinery-using, occupations — and nearly all machinery is necessarily made of iron; the displacement of wood by iron for ship and bridge building; the great extension of the use of iron beams, columns, and other pieces in constructing buildings of various kinds; the growth of steam and electric railways; and the introduction of iron fencing. The increased importance of Germany and Luxemburg may be referred in large part to the invention of the basic Bessemer and open-hearth processes by Thomas, who by them gave an inestimable value to the phosphoric ores of these countries. That of the United States is due in part to the growth of its population; to the introduction of labour-saving machinery in iron manufacture; to the grand scale on which this manufacture is carried on; and to the discovery of the cheap and rich ores of the Mesabi region of Lake Superior. But, given all these, the thousand miles which separate the ore fields of Lake Superior from the cheap coal of Pennsylvania would have handicapped the American iron industry most seriously but for the remarkable cheapening of transportation which has occurred. As this in turn has been due to the very men who have developed the iron industry, it can hardly be questioned that, on further analysis, this development must in considerable part be referred to racial qualities. The same is true of the German iron development. We may note with interest that the three great iron producers so closely related by blood—Great Britain, the United States, and Germany and Luxemburg—made in 1889 79 per cent. of the world's pig iron and 81 per cent. of its steel; and that the four great processes by which nearly all steel and wrought iron are made—the puddling, crucible, and both the acid and basic varieties of the Bessemer and open-hearth processes, as well as the steam-hammer and grooved rolls for rolling iron and steel—were invented by Britons, though in the case of the open-hearth process Great Britain must share with France the credit of the invention. (H. M. H.)

Tables V., VI., VII., and VIII., are compiled mainly from figures given in Mr J. M. Swank's Reports (American Iron and Steel Association). Other authorities are indicated as follows: [a], *The Mineral Industry*, 1892; [b], *Idem*, 1899; [d], *Journal Iron and Steel Institute*, 1881, ii.

VII. IRON ORES.

§ 18. *Distribution.*—Iron ores are widely distributed, and found associated with rocks of various geological ages in most of the explored regions of the earth. But their practical exploitation is not as universal as their occurrence, although explorers report, even in remote portions, crude appliances for smelting ores and producing iron

therefrom. The number of regions in which iron ore mines are developed and iron ore is produced on any considerable scale is limited, and the different countries may be divided into three general classes :—

(1) Those which mine sufficient iron ore practically to supply their domestic demand, and export none, or but small amounts, such as the United States, Russia, Austria-Hungary, China, Mexico, &c.

(2) Those which produce and consume domestic ores, but are obliged to draw largely from other countries in order to obtain sufficient raw material of the required character for the iron manufactured. This class includes Great Britain, Germany, France, and Belgium.

(3) Those which have excellent iron ore resources, easily exploited, but utilize only a small proportion and export large amounts of ore. Spain, Sweden, Algeria, Cuba, Italy, and Greece are in this category.

A fourth class will include those countries which neither use nor export any considerable amount of iron ores, *e.g.*, Australia, the South American States, &c. Considered simply as iron ore producers, the United States ranks first, followed by the German empire, British empire, Spain, France, Russia, Austria-Hungary, Sweden, &c.

§ 19. *Composition.*—Iron ores vary greatly in chemical composition and physical characteristics, but may be segregated into four general classes :—

A. *Magnetites*, in which three atoms of iron united with four atoms of oxygen form the magnetic oxide, yielding 72·4 per cent. of iron. These ores are usually hard and dense, and are seldom found unassociated with phosphorus, sulphur, or titanium, while earthy impurities often reduce their commercial yield still further. Magnetites have, however, been won in large quantities which produced 70 per cent. of iron. Some of the leaner ores are enriched by crushing them and separating the ore grains from the gangue by electro-magnetic methods or by jigs. Sulphur is eliminated by roasting.

B. *Red Hematites*, in which two atoms of iron are combined with three atoms of oxygen to form ferric oxide, yielding 70 per cent. of iron. Many of these have an excess of earthy impurities, while some approach chemical perfection as to iron contents, and a number are quite low in phosphorus. Sulphur and titanium are seldom present in notable proportions. They include fossil, slate, dyestone, and flax-seed ores.

C. *Brown Hematites* are of the same chemical composition as red hematites, but the ferric oxide is hydrated, so that the practical limit of yield may be taken at 60 per cent. of iron. In these there is apt to be a considerable amount of phosphorus and often manganese, but seldom sulphur. Some are merely carbonate ores changed by weathering. Bog ores are brown hematites deposited in the beds of extinct or existing lakes. Limonite, goethite, &c., also fall under this head.

D. *Carbonates* are found associated with the Coal Measures, and are combinations of ferrous oxide and carbonic acid in such proportions as to yield when pure to 48·2 per cent. of iron. By roasting, as by protracted weathering, the carbonic acid is driven off, and yields of iron are obtained approximating to those from brown hematite. Carbonates are locally known as clay ironstone, spathic iron ore, black band ore.

A majority of the ores used yield 50 per cent. or more of iron, although where the supply is favoured by local conditions some containing only about 40 per cent. are smelted. The tendency is to use ores naturally rich in iron or to beneficiate lean ores. The expansion of the Bessemer steel industry has required a general subdivision of all ores into Bessemer and non-Bessemer grades, based on the phosphorus contents. Nominally a Bessemer ore may carry one part of phosphorus to each 1000 parts of iron, but commercially the proportion is nearer one to 1300. The practical yield of metal from iron ores as used may be considered as — Magnetites, 45 to 65 per cent.; red hematites, 40 to 60 per cent.; brown hematites, 40 to 55 per cent.; carbonates (roasted), 40 to 55 per cent.

§ 20. *Production.*—The total iron ore production of the world in 1899 is estimated at 81,000,000 gross tons, and for purposes of comparison, figures showing the output of the principal countries in 1880, 1890, and 1899 are given in the following table :—

Production of Iron Ore in the Principal Countries of the World.

Countries.	1880.	1890.	1899.
Great Britain	18,026,049	13,780,767	14,461,330
United States	7,120,362	16,036,043	24,683,173
Germany and Luxemburg	7,238,640	11,406,132	17,970,679
France	2,874,263	3,471,718	5,067,500
Spain	3,565,338	6,546,495	9,234,302
Russia	1,023,883	1,767,313	4,871,461[a]
Austria-Hungary	1,142,606	2,153,789	3,400,585[a]

Belgium	253,499	186,546	217,370[a]
Algeria	164,146	474,632	473,569[a]
Cuba	None.	362,068	368,758

[a] Figures are for year 1898.

The tons used in this table are the gross avoirdupois (2240 ℔) and metric (2204 ℔).

Great Britain.—Sir Lowthian Bell classifies British iron ores as follows :—

1. Altered carbonates (a variety of brown ores), got by open work from the Lias and Oolitic formations in Lincolnshire, Northamptonshire, Leicestershire, &c.
2. Carbonate (clay ironstone), got by mining in the Lias, as in Cleveland.
3. Carbonate (clay ironstone), got from the Coal Measures as it occurs in Scotland, Staffordshire, &c.
4. Red hematite, largely wrought in Lancashire and Cumberland.
5. Brown hematites, such as the ores of Antrim in Ireland and the Forest of Dean, neither of these being now of much importance.
6. Sundries, consisting of different varieties, but all in unimportant quantities.

In the principal iron ore region in England (the Cleveland district) there are two well-known seams of ironstone, the "upper" and "lower" beds. The first is silicious and irregular in quality, and the lower bed may be regarded as the only general source of supply. From this district is obtained nearly one-half the iron ore mined in England, the production for 1899 being estimated as 5,612,742 tons. The ore carries about 33 per cent. of iron on the average. British ores are supplemented by liberal additions of foreign ores, obtained principally from Spain, Sweden, Greece, Algeria, Elba, India, &c. In the year 1899 the imports of foreign ore and manganiferous iron ores into Great Britain was 7,054,578 long tons, of which 6,186,022 tons were contributed by Spain, the greater portion being from the Bilbao district. The probable exhaustion of the rich and easily-mined Bilbao ores has directed attention to other large deposits in the southern section of Spain, which could be drawn upon if needed, while Sweden can supply quantities of magnetic ore. Great Britain's maximum production of iron ore in 1882 was 18,031,957 long tons, while in 1899 but 14,461,330 tons were mined.

United States.—In 1899 the United States, the largest pig-iron-producing country in the world, most of it being smelted from native ores, contributed 24,684,173 tons of iron ores. Of this amount 81 per cent. was of the red hematite variety, 11·23 per cent. brown hematite, 7 per cent. magnetite, and 1·3 per cent. carbonate ores. The iron ore output of 1900 is estimated at 25,500,000 tons. Over 70 per cent. of the domestic iron ores (17,802,955 tons) in 1899 came from the Lake Superior region, situated in the states of Michigan, Minnesota, and Wisconsin. In the Lake Superior basin there are enormous deposits of iron ore. Those upon the south and west are in the United States, and have been liberally exploited. The Canadian deposits in the north have but lately been developed. The American deposits occur in five districts or ranges — Marquette range, in the state of Michigan; Gogebic range and Menominee range, in Michigan

and Wisconsin; and Vermilion and Mesabi ranges in Minnesota. Mesabi the youngest and Marquette the oldest ranges are the largest producers. Many of the deposits are wrought upon an enormous scale, ten mines in the Lake Superior region producing from 500,000 to over 1,000,000 tons in 1899. In the eastern portion of the United States, New York and New Jersey supply magnetites, Massachusetts and Connecticut brown hematites. Pennsylvania produces about one million tons annually, most of which is magnetite from the Cornwall ore hills. In the south, Virginia, Georgia, Alabama, Tennessee, and Texas supply hematites. Hematites also and some magnetites are won in the Rocky Mountains region, from the states of Wyoming, Colorado, Utah, and New Mexico Territory. Some of this iron ore and also that obtained in California is used as a flux for silver smelting. Carbonate ores are mined in Pennsylvania, New York, Ohio, and Maryland.

Germany.—Iron ores are liberally distributed throughout the German empire, but the largest deposits are in the Grand Duchy of Luxemburg and German Lorraine, where Oolitic ores, locally known as minette, are found, in a length of rather less than 40 miles and a width of about 8 miles; the beds also extend into Belgium and France. More than one-half of the output of the German empire comes from this minette district of Lorraine and Luxemburg. The average analyses of the ores show that they contain from 28 to occasionally 48 per cent. of iron, with phosphorus ranging from 0·5 to 2 per cent. The ore district of Siegerland ranks next in importance. Most of the ores are spathic, although in some cases red hematites occur. The district contributes about one-tenth of the total for the empire. In Hesse-Nassau red hematites are associated in some instances with brown ores, and manganiferous iron ores form an important supply for the Westphalia furnaces. Probably five-sixths of the German product consists of brown hematite ores in various forms. Germany exports minette ores chiefly to France and Belgium, and imports a considerable amount of foreign ores, the greater portion coming from Sweden. The maximum German product of iron ore, 17,989,665 metric tons, was in 1899.

France.—The iron ore deposits of France, though numerous, are scattered, and except in the eastern portion of the country there are none capable of feeding any considerable number of blast-furnaces. The maximum production was 5,067,500 metric tons in 1899. Since the loss of Alsace-Lorraine a considerable amount of iron ore has been imported into France from the region which was annexed to Germany, while Algeria, Spain, and Italy also contribute.

Russia.—Iron manufacture in Russia, since 1700, has been confined mostly to the Ural region, the ore being smelted with charcoal. Of late years blast-furnaces have been built in Southern Russia to smelt the rich ores found there with mineral fuel, and the advance has been rapid. The ore deposits are chiefly of the magnetic, specular, and red hematite variety; but in Olnetz and Finland lake and bog ores are won, while in Southern Poland brown hematites are found. Practically all the iron ore mined is smelted in the blast-furnaces of the country. The greatest production of iron ore was in 1898, when 4,871,461 tons were reported as being mined.

Spain.—Distributed throughout Spain are large deposits of iron ores, but owing to the lack of good mineral fuel the pig iron industry has not attained importance, and most of the ore won is exported. The greatest yield has been from the Biscayan provinces in the north, but there are valuable deposits extending along the south-eastern coast, commencing with those at Porman, continuing at moderate distances from the coast through the provinces of Murcia, Almeria, and Malaga, and finally trending north-west to the district of Seville, farther inland. The ores of Biscaya are, near the surface, hydrated peroxides, rich in iron and fairly free from phosphorus and sulphur. At greater depths the mass of the unchanged deposit below the gossan or oxidized outcrop is found to be spathic iron ore, containing a larger proportion of sulphur than the zone above. The mines most extensively worked are in the vicinity of Bilbao, and form three groups, known as the Somorrostro, Galdames, and Ollargon. From this district the bulk of the iron ore imported into Great Britain is obtained. Spain in 1899 produced 9,234,302 tons of iron ore.

Sweden.—This country, famous for its iron industry, is almost entirely dependent on magnetic ores, although some hematite or specular ores, and a small amount of lake or bog ore, is mined. The Swedish ores vary from 30 to 70 per cent. of iron, averaging about 50 per cent., and generally (except in the north) contain very little phosphorus. The principal iron ore deposits extend across the country from the Dannemora region, north of Stockholm, towards the Norwegian border, and cover a length of 180 miles. Southwards the region continues to the middle part of the province of Östergötland, and northwards to the northern boundary of Dalecarlia, thus covering 5800 square miles. In the vicinity of the Arctic Circle, in Swedish Finland, are the large deposits of Gellivara, Kirunavara, and Luossavara, connected by a railway 129 miles long with the harbour of Lulea, at the north end of the Baltic Sea. The quality of these ores is variable, but they are usually rich in iron. Although Bessemer ores occur in considerable quantity, the greater part are high in phosphorus. The percentage of sulphur, however, is small. Most of these rich ores are exported, chiefly to Germany, Great Britain, and Austria. Owing to the annual increase of this export trade, and to obtain a harbour open all the year, a railway has been constructed to Victoria Haven (Narvik) in Norway. The advance in the production of iron ore since the opening of the Gellivara deposits in 1892 has been rapid, the maximum for Sweden being 2,435,200 tons in 1899, of which over one-half was exported.

Belgium.—Only about one-tenth of the iron ores smelted in the Belgian blast-furnaces comes from native mines. These are Oolitic iron ores, minette ore, bog ore from Campine, and manganiferous iron ore from Liége. The chief domestic supply comes from the Luxemburg and Lorraine Oolitic limonite ores, carrying 30 to 35 per cent. of iron. The foreign imports are chiefly from Germany, France, Spain, Sweden, Algeria, &c. The amount of native ore produced approximates 200,000 tons per annum; about $2\frac{1}{2}$ million tons of iron ore are annually imported, and 300,000 tons exported.

Other Countries.—Algeria has important deposits of iron ore, chiefly magnetite, red and brown hematite, and siderite. The mines at present worked are in the department of Constantine, and produce annually about half a million tons of iron ore, all of which is exported. The iron ores of Greece are carbonates, hematites, and magnetites, most of which contain manganese. A considerable quantity of ore is mined, all of which is exported. In Italy about 250,000 tons of red hematite and specular, with some magnetic iron ore, is mined and exported, mostly from the island of Elba. Owing to the lack of fuel, the pig iron industry of Italy is of minor importance. In the south-eastern portion of Cuba are rich deposits of red hematite ores, operated by American companies, producing, in 1899, 368,758 tons of ore. Since 1884, when shipments commenced, Cuba produced to 1899 inclusive 4,000,000 tons of iron ore, nearly all of which was sent to the United States. Canada has numerous deposits of iron ore, and is developing an important iron industry. On Lake Superior red hematite is worked, in Nova Scotia red and brown hematites are won, in Ontario red hematites and magnetites occur, while in Quebec bog ores are obtained. In British Columbia are deposits of magnetite. Newfoundland has an extensive deposit of red hematite ore, carrying about 50 per cent. of iron, which is easily won by quarrying. Asia, Africa, South America, and Australia have iron ore deposits, but only India, China, and Mexico can be considered as manufacturing iron in appreciable amounts. (J. Bi*.)

Iron Mountain, capital of Dickinson county, Michigan, U.S.A., on the Menominee river, in the north-western part of the state, at an altitude of 1142 feet. Its site is level and its plan regular. It is at the intersection of branches of the Chicago and North-Western, and the Chicago, Milwaukee, and St Paul railways. It is in an iron-mining and lumber region. Population (1890), 8599; (1900), 9242, of whom 4376 were foreign-born.

Ironton, capital of Lawrence county, Ohio, U.S.A., on the north bank of the Ohio, in the southern part of the state, at an altitude of 540 feet. It has three railways—the Cincinnati, Hamilton, and Dayton, the Ironton, and the Norfolk and Western, which, with the navigation of the river, give it a large trade in iron and coal, which are the leading products of the surrounding region. It contains blast-furnaces, rolling-mills, and foundries, and has extensive manufactures of iron goods. It contained in 1900 112 manufacturing establishments, which had a total capital of $3,321,219, and employed an average number of 1758 wage-earners. The total value of the products was $5,715,112. Population (1880), 8857; (1890), 10,939; (1900), 11,868, of whom 714 were foreign-born and 924 were negroes.

Ironwood, a city of Gogebic county, Michigan, U.S.A., in the Gogebic iron range, in the extreme north-western part of the state, at an altitude of 1506 feet. It is on the Chicago and North-Western and the Wisconsin Central railways, and is devoted almost entirely to iron-mining. Population (1890), 7745; (1900), 9705, of whom 4615 were foreign-born.

IRRIGATION.

I. General.

THE subject of irrigation is discussed generally in the earlier volumes of the Encyclopædia (9th edition, vol. xiii.), and the treatment of water-meadows in England is there described minutely and accurately. Little is said, however, of the great systems of irrigation prevailing in tropical and sub-tropical countries, which differ from the irrigation practised in England as much as the cultivation of an American prairie differs from that of a dainty English flower-garden. It is of this irrigation on a large scale that it is now proposed to treat. It is to be found in Europe only in the rich plains of Northern Italy, and in some of the provinces of Spain. In Spain it can be traced directly to the Moorish Conquest, and almost everywhere throughout Asia or Africa where the Moslem has raised his green flag is to be found some knowledge of irrigation. But the art was known long before the days of Mahommed, and it is certain that there could have been no population in the Nile valley until the habit was established of sowing grain on the muddy surface of the land from which the flood water was slowly retreating, and in due time of reaping the crops.

Primitive methods.

The simplest form of irrigation is when the water is raised from a river or lake, or from a well situated in a field. The sculptures and paintings of ancient Egypt bear no trace of anything approaching scientific irrigation, but they often show the peasant bailing the water up from the Nile. By means of this simple plan of raising water and pouring it over the fields thousands of acres are watered every year in India, and the system has many advantages in the eyes of the peasant. Though there is great waste of labour, he can apply his labour when he likes; no permission is required from a Government official; no one has to be bribed. The simplest and earliest form of water-raising machinery is the pole with a bucket suspended from one end of a crossbeam and a counterpoise at the other. In India this is known as the *denkli* or *paecottah*; in Egypt it is called the *shadúf*. All along the Nile banks from morning to night may be seen brown-skinned peasants working these *shadúfs*, tier above tier, so as to raise the water 15 or 16 feet on to their lands. With a *shadúf* it is only possible to keep about 4 acres watered, so that a great number of hands are required to irrigate a large surface. Another method largely used is the shallow basket or bucket suspended to strings between two men, who thus bail up the water. A step higher than these is the rude water-wheel, with earthen pots on an endless chain running round it, worked by one or two bullocks. This is used everywhere in Egypt, where it is known as the *sakya*. In Northern India it is termed the *harat*, or Persian wheel. With one such water-wheel a pair of oxen can raise water any height up to 18 feet, and keep from 5 to 12 acres irrigated throughout an Egyptian summer. A very familiar means in India of raising water from wells in places where the spring level is as much sometimes as 100 feet below the surface of the field is the *churras*, or large leather bag, suspended to a rope passing over a pulley, and raised by a pair of bullocks which go up and down a slope as long as the depth of the well. All these primitive contrivances are still in full use throughout India. Egypt has of late years been more in touch with Western civilization, and the prosperous farmer prefers to employ a centrifugal pump driven by a fixed or portable steam engine. There are now about 400 of the former and 2000 of the latter at work on the Nile and the canals of Lower Egypt.

Irrigation on a really large scale, however, requires that the water shall flow over the surface of the land by gravitation, without being artificially raised. This may be effected either by canals drawn from a river, and flowing on a slope less than that of the country, so as ultimately to obtain a command over it, or by reservoirs formed by throwing masonry or earthen embankments across valleys, and there storing up the rainfall. The water is discharged from a sluice at the bottom of the embankment, and flows over the adjoining land at the foot of the valley. Canal irrigation is very much the more important of the two, but before describing it a little will be said about what can be done by reservoirs.

Irrigation reservoirs.

Among the valleys of a rolling country it is often easy to find a site for a good reservoir, and if the rainfall comes down in heavy showers, it may not be difficult to catch and store it. The points to be aimed at are to find (1) a valley with a large catchment basin and hard rocky sides, off which the rain water will quickly flow; (2) a narrow neck across which a dam may easily be thrown, with firm sides into which it can be built; (3) a good site for a waste-weir and channel down which to pass flood water; and (4) either good and easily quarried stone for building a masonry dam, or beds of clay for constructing the solid puddle core which should form the centre of an earthen embankment. Of course all these requirements are useless if there is not also suitable land to irrigate down-stream of the dam.

Spain.

Reservoirs are familiar everywhere for the water-supply of towns, but as the volume necessary, even for a large town, does not go far in irrigating land, many sites which would do admirably for the former would not contain water sufficient to be worth applying to the latter purpose. In the Mediterranean provinces of Spain there are some very remarkable irrigation dams. The great masonry dam of Alicante on the river Monegre, which dates from 1579, is situated in a narrow gorge, so that while 140 feet high, it is only 190 feet long at the crest. The reservoir is said to contain 130 million cubic feet of water, and to serve for the irrigation of 9000 acres, but unless it refills several times a year, it is hardly possible that so much land can be watered in any one season. The Elche reservoir, in the same province, has a similar dam 55 feet high. In neither case is there a waste-weir, the surplus water being allowed to pour over the crest of the dam. South of Elche is the province of Murcia, watered by the river Segura, on which there is a dam 25 feet high, said to be 800 years old, and to serve for the irrigation of 25,000 acres. The Lorca dam in the same neighbourhood irrigates 27,000 acres. In the jungles of Ceylon are to be found remains of gigantic irrigation dams, and on the neighbouring mainland of Southern India, throughout the provinces of Madras and Mysore, the country is covered with irrigation reservoirs, or, as they are locally termed, tanks. These vary from village ponds to lakes 14 or 15 miles long. Most of them are of old native construction, but they have been greatly improved and enlarged since, say, 1850. The casual traveller in Southern India constantly remarks the ruins of old dams, and the impression is conveyed that at one time, before British rule prevailed, the irrigation of the country was much more perfect than it is

India.

now. That idea, however, is mistaken. An irrigation reservoir, like a human being, has a certain life. Quicker or slower, the water that fills it will wash in sand and mud, and year by year this process will go on till ultimately the whole reservoir is filled up. The embankment is raised, and raised again, but at last it is better to abandon it and make a new tank elsewhere, for it would never pay to dig out the silt by manual labour. It may safely be said that at no time in history were there more tanks in operation than at present. The ruins which are seen are the ruins of long centuries of tanks that once flourished and became silted up. But they did not all flourish at once. In the countries now being considered, the test of an irrigation work is how it serves in a season of drought and famine. It is evident that if there is a long cessation of rain, there can be none to fill the reservoirs. In September 1877 there were very few in all Southern India that were not dry. But even so, they helped to shorten the famine period; they stored up the rain after it had ceased to fall, and they caught up and husbanded the first drops when it began again.

Irrigation canals. Irrigation effected by river-fed canals naturally depends on the regimen of the rivers. Some rivers vary much in their discharge at different seasons. In some cases this variation is comparatively little. Sometimes the flood season recurs regularly at the same time of the year; sometimes it is uncertain. In some rivers the water is generally pure; in others it is highly charged with fertilizing alluvium, or, it may be, with barren silt. In rainless countries, such as Egypt or Sind, there can be no cultivation without irrigation. Elsewhere the rainfall may be sufficient for ordinary crops, but not for the more valuable kinds. In ordinary years in Southern India the maize and the millet, which form so large a portion of the peasants' food, can be raised without irrigation, but it is required for the more valuable rice or sugar-cane. Elsewhere in India the rainfall is usually sufficient for all the cultivation of the district, but about every eleven years comes a season of drought, during which canal water is so precious as to make it worth while to construct costly canals merely to serve as a protection against famine. When a river partakes of the nature of a torrent, dwindling to a paltry stream at one season and swelling into an enormous flood at another, it is impossible to construct a system of irrigation canals without very costly engineering works, sluices, dams, waste-weirs, &c., so as to give the engineer entire control of the water. Such may be seen on the canals of Cuttack, derived from the Mahanadi, a river of which the discharge does not exceed 400 cubic feet per second in the dry season, and rises to 1,600,000 cubic feet per second in the rainy season. Very differently situated are the great canals of Lombardy, drawn from the Ticino and Adda rivers, flowing from the Maggiore and Como lakes. The severest drought never exhausts these reservoirs, and the heaviest rain can never convert these rivers into the resistless floods which they would be but for the moderating influence of the great lakes. The Ticino and Adda do not rise in floods more than 6 or 7 feet above their ordinary level, or fall in droughts more than 4 or 5 feet below it, and their water is at all seasons very free from silt or mud. Irrigation cannot be practised in more favourable circumstances than these. The great lakes of Central Africa, Victoria and Albert Nyanzas, and the vast swamp tract of the Sudan, do for the Nile on a gigantic scale what Lakes Maggiore and Como do for the rivers Ticino and Adda. But for these great reservoirs the Nile would decrease in summer to quite an insignificant stream. India possesses no great lakes from which to draw rivers and canals, but through the plains of Northern India flow rivers which are fed from the glaciers of the Himalaya; and the Ganges, the Indus, and their tributaries are thus prevented from diminishing very much in volume. The greater the heat, the more rapidly melts the ice, and the larger the quantity of water available for irrigation. The canal system of Northern India is the most perfect the world has yet seen, and contains works of hydraulic engineering which can be equalled in no other country. In the deltas of Southern India irrigation is only practised during the monsoon season. The Godaveri, Kistna, and Kaveri all take their rise on the Western Ghats, a region where the rainfall is never known to fail in the monsoon season. Across the apex of the deltas are built great weirs (that of the Godaveri being $2\frac{1}{2}$ miles long),

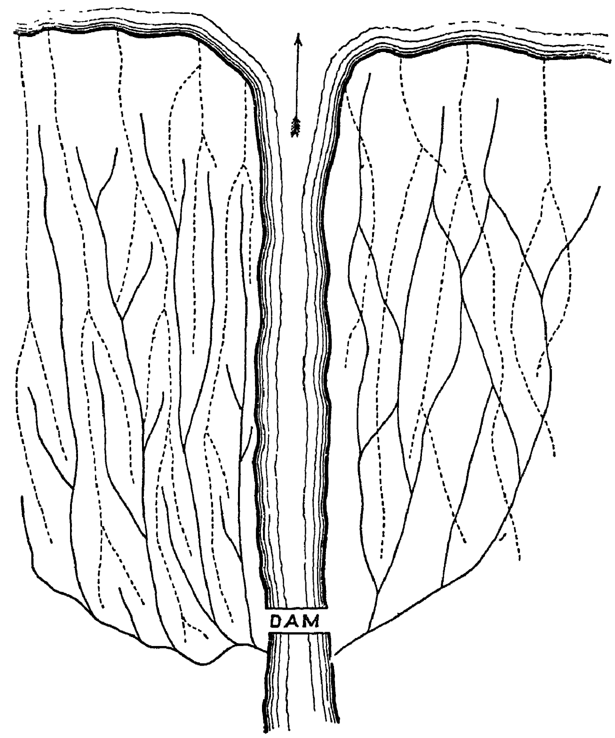

FIG. 1.—Diagram showing irrigation properly combined with drainage (*to left*), and laid out regardless of drainage required later (*to right*).

at the ends and centre of which is a system of sluices feeding a network of canals. For this monsoon irrigation there is always abundance of water, and so long as the canals and sluices are kept in repair, there is little trouble in distributing it over the fields. Similar in character was the ancient irrigation of Egypt, practised merely during the Nile flood—a system which is still the only one that prevails throughout the greater part of Upper Egypt. A detailed description of it will be found below.

Distribution of the water. Where irrigation is carried on throughout the whole year, even when the supply of the river is at its lowest, the distribution of the water becomes a very delicate operation. It is generally considered sufficient in such cases if during any one crop one-third of the area that can be commanded is actually supplied with water. This encourages a rotation of crops and enables the precious liquid to be carried over

a larger area than could be done otherwise. It becomes then the duty of the engineer in charge to use every effort to get its full value out of every cubic foot of water. Some crops of course require water much oftener than others, and much depends on the temperature at the time of irrigation. During the winter months in Northern India magnificent wheat crops can be produced that have been watered only twice or thrice. But to keep sugar-cane, or indigo, or cotton alive in summer before the monsoon sets in in India or the Nile rises in Egypt the field should be watered every ten days or fortnight, while rice requires a constant supply of water passing over it.

Drainage.

Experience in these sub-tropical countries shows the absolute necessity of having, for successful irrigation, also a system of thorough drainage. It was some time before this was discovered in India, and the result has been the deterioration of much good land. In Egypt, prior to the British occupation in 1883, no attempt had been made to take the water off the land. The first impression of a great alluvial plain is that it is absolutely flat, with no drainage at all. Closer examination, however, shows that if the prevailing slopes are not more than a few inches in the mile, yet they do exist, and scientific irrigation requires that the canals should be taken along the crests and drains along the hollows. In the preceding diagram (Fig. 1) is shown to the right of the river a system of canals branching out and afterwards rejoining one another, so as to allow of no means for the water that passes off the field to escape into the sea. Hence it must either evaporate or sink into the soil. Now nearly all rivers contain some small percentage of salt, which forms a distinct ingredient in alluvial plains. The result of this drainless irrigation is an efflorescence of salt on the surface of the field. The spring level rises, so that water can be reached by digging only a few feet, and the land, soured and water-logged, relapses into barrenness. Of this description was the irrigation of Lower Egypt previous to 1883. To the left of the diagram is shown (by firm lines) a system of canals laid out scientifically, and of drains (by dotted lines) flowing between them. It is the effort of the British engineers in Egypt to remodel the surface of the fields to this type.

Further information may be found in MONCRIEFF. *Irrigation in Southern Europe.* London, 1868.—MONCRIEFF. "Lectures on Irrigation in Egypt," *Professional Papers of the Corps of Royal Engineers,* vol. xix. London, 1893.—WILLCOCKS. *Egyptian Irrigation,* 2nd edition. London, 1899. (C. S. M.)

II. EGYPT.

Characteristics of the Nile Valley and flood.

The very life of Egypt depends on its irrigation, and, ancient as this irrigation is, it was never practised on a really scientific system till after the British occupation. As every one knows, the valley of the Nile outside of the tropics is practically devoid of rainfall. Yet it was the produce of this valley that formed the chief granary of the Roman Empire. Probably nowhere in the world is there so large a population per square mile depending solely on the produce of the soil. Probably nowhere is there an agricultural population so prosperous, and so free from the risks attending seasons of drought or of flood. This wealth and prosperity are due to two very remarkable properties of the Nile. First, the regimen of the river is nearly constant. The season of its rise and its fall, and the height attained by its waters during the highest flood and at lowest Nile, vary to a comparatively small extent. Year after year the Nile rises at the same period, it attains its maximum in September and begins to diminish first rapidly till about the end of December, and then more slowly and more steadily until the following June. A late rise is not more than about three weeks behind an early rise. From the lowest to the highest gauge of water-surface the rise is on an average 25·5 feet at the First Cataract. The highest flood is 3·5 feet above this average, and this means peril, if not disaster, in Lower Egypt. The lowest flood on record has risen only to 5·5 feet below the average, or to 20 feet above the mean water-surface of low Nile. Such a feeble Nile flood has occurred only twice in modern history: in 1877, when it caused widespread famine and death throughout Upper Egypt, 947,000 acres remained barren, and the land revenue lost £1,112,000; and in 1899, when by the thorough remodelling of the whole system of canals since 1883 all famine and disaster were avoided, and there occurred a loss of only £300,000 to the revenue of the country. This regularity of flow is the first exceptional excellence of the river Nile. The second is hardly less valuable, and consists in the remarkable richness of the alluvium brought down the river year after year during the flood. The object of the engineer is so to utilize this flood-water that as little as possible of the alluvium may escape into the sea, and as much as possible may be deposited on the fields. It is the possession of these two properties that imparts to the Nile a value quite unique among rivers, and gives to the farmers of the Nile Valley advantages over those of any rain-watered land in the world.

Irrigation during high Nile.

Until the 19th century irrigation in Egypt on a large scale was practised merely during the Nile flood. Along each edge of the river and following its course has been erected an earthen embankment high enough not to be topped by the highest floods. In Upper Egypt, the valley of which rarely exceeds six miles in width, a series of cross embankments have been constructed, abutting at the inner ends on those along the Nile, and at the outer ends on the ascending sides of the valley. The whole country has thus been divided into a series of oblongs, surrounded by embankments on three sides and by the desert slopes on the fourth. These oblong areas vary from 60,000 to 1500 or 2000 acres in extent. Throughout all Egypt the Nile is deltaic in character; that is, the slope of the country in the valley is away from the river, and not towards it. It is easy, then, when the Nile is low, to cut short, deep canals in the river banks, which fill as the flood rises, and carry the precious mud-charged water into these great flats. There the water remains for a month or more, some three feet deep, depositing its mud, and thence at the end of the flood the almost clear water may either be run off directly into the receding river, or cuts may be made in the cross embankments, and it may be allowed to flow from one flat to another, and ultimately into the river. In November the waters have passed off; and whenever a man can walk over the mud with a pair of bullocks, it is roughly turned over with a wooden plough, or merely the branch of a tree, and the wheat or barley crop is immediately sown. So soaked is the soil after the flood, that the grain germinates, sprouts, and ripens in April, without a shower of rain or any other watering. In Lower Egypt this system was somewhat modified, but it was the same in principle. No other was known in the Nile Valley until the country fell, early in the 19th century, under the vigorous rule of Mehemet Ali Pasha. He soon recognized that with such a climate and soil, with a teeming population, and with the markets of Europe so near, they might produce in Egypt something more profitable than wheat and maize. Cotton and sugar-cane would fetch far higher prices, but they could only be grown while the Nile was low, and they required water at all seasons.

It has already been said that the rise of the Nile is about 25½ feet, so that a canal constructed to draw water out of the river while at its lowest must be 25½ feet

deeper than if it is intended to draw off only during the highest floods. Mehemet Ali began by deepening the canals of Lower Egypt by this amount, a gigantic and futile task; for as they had been laid out on no scientific principles, the deep channels became filled with mud during the first flood, and all the excavation had to be done over again, year after year. With a serf population even this was not impossible; but as the beds of the canals were graded to no even slope, it did not follow that if water entered the head it would flow evenly on. As the river daily fell, of course the water in the canals fell too, and since they were never dug deep enough to draw water from the very bottom of the river, they occasionally ran dry altogether in the month of June, when the river was at its lowest, and when, being the month of greatest heat, water was more than ever necessary for the cotton crop. Thus large tracts which had been sown, irrigated, weeded, and nurtured for perhaps three months, perished in the fourth, while all the time the precious Nile water was flowing useless to the sea. The obvious remedy was to throw a weir across each branch of the river to control the water, and force it into canals taken from above it. The task of constructing this great work was committed to Mougel Bey, a French engineer of ability, who designed and constructed the great barrage across the two branches of the Nile at the apex of the delta, about 12 miles north of Cairo (Fig. 2). It was built to consist of two bridges—one over the eastern or Damietta branch of the river having 71 arches, the other, over the Rosetta branch, having 61 arches, each arch being of 5 metres, or 16·4 feet, span. The building was all of stone, the floors of the arches were inverts. The height of pier from edge of flooring to spring of arch was 28·7 feet, the spring of the arch being about the surface-level of maximum flood. The arches were designed to be fitted with self-acting drop gates; but they were not a success, and were only put into place on the Rosetta branch. The gates were intended to hold up the water 4·5 metres, or 14·76 feet, and to divert it into three main canals—the Behera on the west, the Menufia in the centre, and the Tewfikia on the east. The river was thus to be emptied, and to flow through a whole network of canals, watering all Lower Egypt. Each barrage was provided with locks, to pass Nile boats 160 by 28 feet in area.

Irrigation during low Nile.

The Nile barrage.

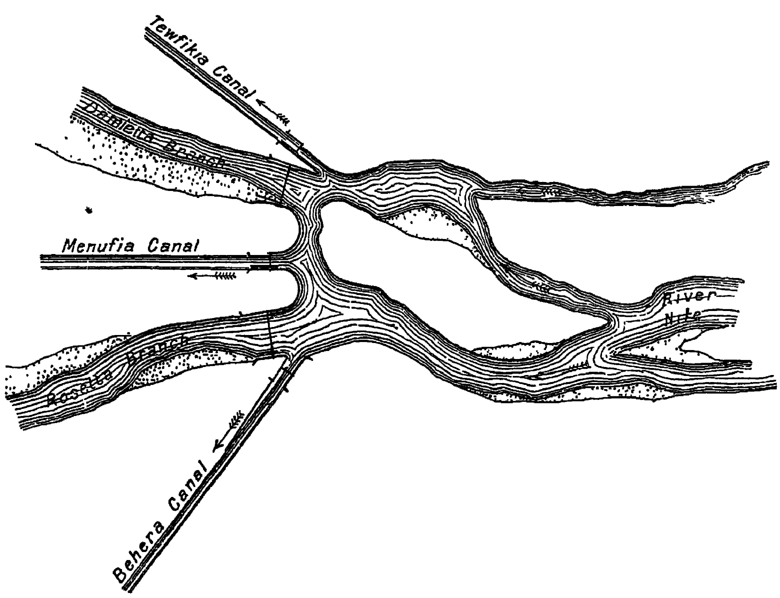

Fig. 2.—Map showing the Damietta and Rosetta dams on the Nile.

Mougel's barrage, as it may now be seen, is a very imposing and stately work. Considering his want of experience of such rivers as the Nile, and the great difficulties he had to contend with under a succession of ignorant Turkish rulers, it would be unfair to blame him because, until it fell into the hands of British engineers in 1884, the work was condemned as a hopeless failure. It took long years to complete, at a cost which can never be estimated, since much of it was done by serf labour. In 1861 it was at length said to be finished; but it was not until 1863 that the gates of the Rosetta branch were closed, and they were reopened again immediately, as a settlement of the masonry took place. The experiment was repeated year after year till 1867, when the barrage cracked right across from foundation to top. A massive coffer-dam was then erected, covering the eleven arches nearest the crack; but the work was never trusted again, nor the water-surface raised more than about three feet.

An essential part of the barrage project was the three canals, taking their water from just above it, as shown in Fig. 2. The heads of the existing old canals, taken out of the river at intervals throughout the delta, were to be closed, and the canals themselves all put into connexion with the three high-level trunk lines taken from above the barrage. The central canal, or Menufia, was more or less finished, and, although full of defects, has done good service. The eastern canal was never dug at all until the British occupation. The western, or Behera, canal was dug, but within its first 50 miles it passes through desert, and sand drifted into it. *Corvées* of 20,000 men used to be forced to clear it out year after year, but at last it was abandoned. Thus the whole system broke down, the barrage was pronounced a failure, and attention was turned to watering Lower Egypt by a system of gigantic pumps, to raise the water from the river and discharge it into a system of shallow surface-canals, at an annual cost of about £250,000, while the cost of the pumps was estimated at £700,000. Negotiations were on foot for carrying out this system when the British engineers arrived in Egypt. They soon resolved that it would be very much better if the original scheme of using the barrage could be carried out, and after a careful examination of the work they were satisfied that this could be done. The barrage rests entirely on the alluvial bed of the Nile. Nothing more solid than strata of sand and mud is to be found for more than 200 feet below the river. It was out of the question, therefore, to think of founding on solid material, and yet it was desired to have a head of water of 13 or 14 feet upon the work. Of course, with such a pressure as this, there was likely to be percolation under the foundations and a washing-out of the soil. It had to be considered whether this percolation could best be checked by laying a solid wall across the river, going down to 50 or 60 feet below its bed, or by spreading out the foundations above and below the bridge, so as to form one broad water-tight flooring—a system practised with eminent success by Sir Arthur Cotton in Southern India. It was decided to adopt the latter system. As originally designed, the flooring of the barrage from up-stream to down-stream face was 111·50 feet wide, the distance which had to be travelled by water percolating under the foundations. This width of flooring was doubled to 223 feet, and along the up-stream face a line of sheet piling was driven 16 feet deep. Over the old flooring was superposed 15 inches of the best rubble

masonry, an ashlar floor of blocks of close-grained trachyte being laid directly under the bridge, where the action was severest. The working season lasted only from the end of November to the end of June, while the Nile was low; and the difficulty of getting in the foundations was increased, as, in the interests of irrigation and to supply the Menufia canal, water was held up every season while the work was in progress to as much as 10 feet. The work was begun in 1886, and completed in June 1890. Moreover, in the meantime the eastern, or Tewfikia, canal was dug and supplied with the necessary masonry works for a distance of 23 miles, to where it fed the network of old canals. The western, or Behera, canal was thoroughly cleared out and remodelled; and thus the whole delta irrigation was supplied from above the barrage.

The outlay on the barrage between 1883 and 1891 amounted to about £460,000. The average cotton crop for the 5 years preceding 1884 amounted to 123,000 tons, for the 5 years ending 1898 it amounted to 251,200 tons. At the low rate of £40 per ton, this means an annual increase to the wealth of Lower Egypt of £5,128,000. Since 1890 the barrage has done its duty without accident, but a work of such vast importance to Lower Egypt required to be placed beyond all risk. It having been found that considerable hollow spaces existed below the foundations of some of the piers, five bore-holes from the top of the roadway were pierced vertically through each pier of both barrage, and similar holes were drilled at intervals along all the lock walls. Down these holes cement grout was injected under high pressure on the system of Mr Kinipple. The work was successfully carried out during the seasons 1896 to 1898. During the summer of 1898 the Rosetta barrage was worked under a pressure of 14 feet. But this was looked on as too near the limit of safety to be relied on, and in 1899 subsidiary weirs were started across both branches of the river a short distance below the two barrages. These were estimated to cost £530,000 altogether, and were to stand 10·8 feet above the river's bed, allowing the water-surface up-stream of the barrage to be raised 7·2 feet, while the pressure on that work itself would not exceed 10 feet. These weirs were satisfactorily completed in 1901.

The barrage is the greatest, but by no means the only, important masonry work in Lower Egypt. Numerous regulating bridges and locks have been built, to give absolute control of the water and facilities for navigation; and in 1901 a second weir was begun opposite Zifta across the Damietta branch of the Nile, to improve the irrigation of the Dakhleh province.

In the earlier section of this article it is explained how necessary it is that irrigation should always be accompanied by drainage. This had been totally neglected in Egypt; but very large sums have been spent on it, and the country is now covered with a network of drains nearly as complete as that of the canals.

Basin irrigation of Upper Egypt.

The ancient system of basin irrigation is still generally pursued in Upper Egypt. It seems simple enough; but in order really to flood the whole Nile Valley during seasons of defective as well as favourable floods, a system of regulating sluices, culverts, and syphons is necessary; and for want of such a system it was found, in the feeble flood of 1888, that there was an area of 260,000 acres over which the water never flowed. This cost a loss of land revenue of about £300,000, while the loss of the whole season's crop to the farmer was of course much greater. The attention of the British engineers was then called to this serious calamity; and fortunately for Egypt, there was serving in the country Col. J. C. Ross, R.E., an officer who had devoted many years of hard work to the irrigation of the North-West Provinces of India, and who possessed quite a special knowledge as well as a glowing enthusiasm for the subject. Fortunately, too, it was possible to supply him with the necessary funds to complete and remodel the canal system. When the surface-water of a river is higher than the fields right and left, there is nothing easier than to breach the embankments and flood the fields—in fact, it may be more difficult to prevent their being flooded than to flood them —but in ordinary floods the Nile is never higher than all the bordering lands, and in years of feeble flood it is higher than none of them. To water the valley, therefore, it is necessary to construct canals having bed-slopes less than that of the river, along which the water flows until its surface is higher than that of the fields. If, for instance, the slope of the river be 4 inches per mile, and that of the canal 2 inches, it is evident that at the end of a mile the water in the canal will be 2 inches higher than in the river; and if the surface of the land is 3 feet higher than that of the river, the canal, gaining on it at 2 inches per mile, will reach the surface in 18 miles, and from thence onwards will be above the adjoining fields. But to irrigate this upper 18 miles, water must either be raised artificially, or supplied from another canal taking its source 18 miles farther up. This would, however, involve the country in great lengths of canal between the river and the field, and circumstances are not so unfavourable as this. Owing to the deltaic nature of the Nile Valley, the fields on the banks are 3 feet above the flood, at 2 miles away from the banks they may not be more than 1 foot above that level, so that the canal, gaining 2 inches per mile and receding from the river, will command the country in 6 miles. The slope of the river, moreover, is taken in its winding course; and if it is 4 inches per mile, the slope of the axis of the valley parallel to which the canals may be made to flow is at least 6 inches per mile, so that a canal with a slope of 2 inches gains 4 inches per mile.

The system of having one canal overlapping another has one difficulty to contend with. Occasionally the desert cliffs and slopes come right down to the river, and it is difficult, if not impossible, to carry the higher-level canals past these obstructions. It should also be noticed that on the higher strip bordering the river it is the custom to take advantage of its nearness to raise water by pumps, or other machinery, and thereby to grow valuable crops of sugar-cane, maize, or vegetables. When the river rises, these crops, which often form a very important part of the year's produce and are termed *Nabári*, are still in the ground, and they require water in moderate and regulated quantities, in contradistinction to the wholesale flooding of the flats beyond. Fig. 3 will serve to explain this system of irrigation, the firm lines representing canals, the dotted lines embankments. It will be seen, beginning on the east or right bank of the river, that a high-level canal from an upper system is carried past a steep slope, where perhaps it is cut entirely out of rock, and it divides into two. The right branch waters all the desert slopes within its reach and level. The left branch passes, by a syphon aqueduct, under what is the main canal of the system, taken from the river close at hand (and therefore at a lower level). This left branch irrigates the *Nabári* on the high lands bordering the river. In years of very favourable flood this high-level canal would not be wanted at all: the irrigation could be done from the main canal, and with this great advantage, that the main canal water would carry with it much more fertilizing matter than would be got from the tail of the high-level canal, which left the river perhaps

25 miles up. The main canal flows freely over the flats C and D, and, if the flood is good, over B and part of A. It is carried round the next desert point, and to the north becomes the high-level canal. The masonry works required for this system are a syphon to pass the high level under the main canal near its head, bridges fitted with sluices where each canal passes under an embankment, and an escape weir at the tail of the system, just south of the desert point, to return surplus water to the river. Turning to the left bank, there is the same high-level canal from the upper system irrigating the basins K, P, and L, as well as the large basin E in such years as it cannot be irrigated from the main canal. Here there are two main canals—one following the river, irrigating a series of smaller basins, and throwing out a branch to its left, the other passing under the desert slopes and supplying the basins F, G, H, and S. For this system two syphons will be required near the head, regulating bridges under all the embankments, and an escape weir back into the river.

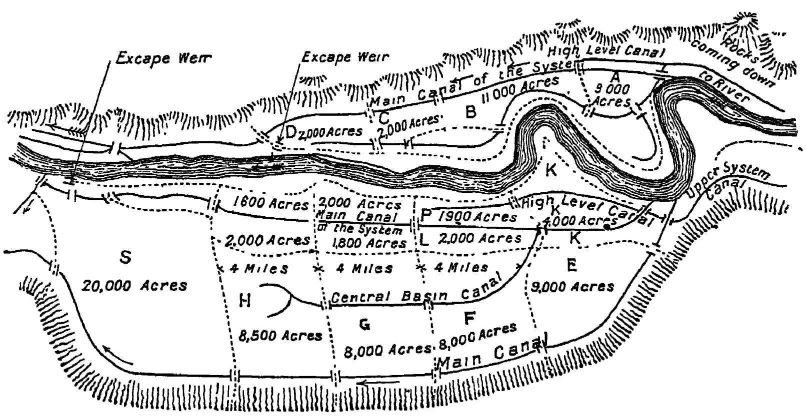

FIG. 3.—Map of the basin system of irrigation.

In the year following 1888 about 100 new masonry works of this kind were built in Upper Egypt, nearly 400 miles of new canal were dug, and nearly 300 miles of old canal were enlarged and deepened. The outlay altogether was about £800,000, and the result has been, as already stated, that with a complete failure of the Nile flood the loss to the country has been trifling compared with that of 1877.

There is one exception in Upper Egypt to the basin system of irrigation. The Khedive Ismail having acquired vast estates in the provinces of Assiut, Minieh, Beni-Suef, and the Fayúm, resolved to grow sugar-cane on a very large scale, and with this object constructed a very important perennial canal, named the Ibrahimia, taking out of the left bank of the Nile at the town of Assiut, and flowing parallel to the river for about 200 miles, with an important branch which irrigates the Fayúm. This canal was badly constructed, and by entirely blocking the drainage of the valley did a great deal of harm to the lands. Most of its defects have been remedied, but one remains. There being at its head no weir across the Nile, the water in the Ibrahimia canal rises and falls with that of the river, and so the supply is apt to run short during the hottest months, as was the case with the canals of Lower Egypt before the barrage was built. To supply the Ibrahimia canal at all during low Nile, it had been necessary to carry on dredging operations at an annual cost of about £12,000. This has now been rectified, in the same way as in Lower Egypt, by the construction of a weir across the Nile, intended to give complete control over the river and to raise the water-surface 8·2 feet. The Assiut weir is constructed on a design very similar to that of the barrage in Lower Egypt. It consists of a bridge of 111 arches, each 5 metres span, with piers of 2 metres thickness. In each arch are fitted two gates. There is a lock 80 metres long and 16 metres wide at the left or western end of the weir, and adjoining it are the regulating sluices of the Ibrahimia canal. The Assiut weir across the Nile is just about half a mile long. The work was begun at the end of 1898, and finished early in 1902.

Assiut weir.

This weir, as well as that in Lower Egypt, is intended to raise the water-surface above it, and to control the distribution of its supply, but in no way to store that supply. The idea of ponding up the superfluous flood discharge of the river is not a new one, and if Herodotus is to be believed, it was a system actually pursued at a very early period of Egyptian history, when Lake Moeris in the Fayúm was filled at each Nile flood, and drawn upon as the river ran down. When British engineers first undertook the management of Egyptian irrigation, many representations were made to them of the advantage of storing the Nile water; but they consistently maintained that before entering on that subject it was their duty to utilize every drop of the water at their disposal. This seemed all the more evident, as at that time financial reasons made the construction of a costly Nile dam out of the question. Every year, however, between 1890 and 1902 the supply of the Nile during May and June was actually exhausted, no water at all flowing then out into the sea. In these years, too, owing to the extension of drainage works, the irrigable area of Egypt was greatly enlarged, so that if perennial cultivation was at all to be increased, it was necessary to increase the volume of the river, and this could only be done by storing up the flood supply. The first difficulty that presented itself in carrying this out, was that during the months of highest flood the Nile is so charged with alluvial matter that to pond it up then would inevitably lead to a deposit of silt in the reservoir, which would in no great number of years fill it up. It was found, however, that the flood water was comparatively free from deposit by the middle of November, while the river was still so high that, without injuring the irrigation, water might go on being stored up until March. Accordingly, the dam is supplied with sluices large enough to discharge unchecked the whole volume of the river as it comes down until the middle of November, and then to begin the storage.

Storage.

The site selected for the great Nile dam was at the head of the First Cataract above Assuan. A dyke of syenite granite here crosses the valley, so hard that the river had nowhere scoured a deep channel through it, and so it was found possible to construct the dam entirely in the open air, without the necessity of laying under-water foundations. The length of the dam is about 6400 feet—nearly $1\frac{1}{4}$ mile. The greatest head of water in it is 65 feet. It is pierced by 140 under-sluices of 150 square feet each, and by 40 upper-sluices, each of 75 square feet. These, when fully open, are capable of discharging the ordinary maximum Nile flood of 350,000 cubic feet per second, with a velocity of 15·6 feet per second and a head of 6·6 feet. The top width of the dam is 23 feet, the bottom width, at the deepest part, about 82 feet. On the left flank of the dam there will be a canal, provided with four locks each 262 by 31 feet in area, so that navigation will be possible at all seasons. It was

Nile dam.

intended at first to raise the dam 26 feet higher, but this would have involved the yearly submergence of the celebrated classical temples of Philæ, situated on an island just up-stream of the dam. Had the natives of Egypt been asked to choose between the preservation of Ptolemy's famed temple and the benefit to be derived from an additional 20 feet depth of water storage, there can be no question that they would have preferred the latter; but they were not consulted, and the classical sentiment and artistic beauty of the place, skilfully pleaded by archæologists and artists, carried the day. As at present designed, the storage capacity of the reservoir is estimated at about 3,750,000 millions of cubic feet, which will create a lake extending up the Nile Valley for about 200 miles. It is calculated that yearly the reservoir should be full before the end of March; after that the water-surface in it will remain constant, the volume reaching the reservoir from the south being passed on through the sluices. In May, when the demand for water increases, first the upper and then the under sluices will be gradually opened, so as to increase the river supply, until July, when all the gates will be open, to allow of the free passage of the flood. In 1902 this magnificent work was completed. The engineer who designed it was Mr W. Willcocks, C.M.G. The contractors were Messrs John Aird & Co., the contract price being £2,000,000. The financial treaties in which the Egyptian Government are bound up would prevent their ever paying so large a sum as this within five years; but a company was formed in London which advances periodically the sum due to the contractors, on receipt from the Government of Egypt of promissory notes to pay sixty half-yearly instalments of £78,613, commencing on the 1st July 1903. There are no treaties to prevent the Government of Egypt from paying so moderate a sum as this year by year, and the payments do not begin until the first year that a return may be expected from the additional irrigation to be effected.

III. INDIA.

At pp. 754, 755 of vol. xii. of this work (9th edition) will be found some account of the irrigation works of India, of the outlay incurred and of the revenue obtained up to the year 1878. That year, which saw the end of a most disastrous famine, may be considered as the commencement of a new era as regards irrigation. It had at last been recognized that such famines must be expected to occur at no very long intervals of time, and that the cost of relief operations must not be met by increasing the permanent debt on the country, but by the creation of a famine relief and a famine insurance fund. For this purpose it was fixed that there should be an annual provision of Rx.1,500,000, to be spent on—(1) relief, (2) protective works, (3) reduction of debt. Among protective works the first place was given to works of irrigation. These works were divided into three classes—(i.) productive works; (ii.) protective works; (iii.) minor works.

Productive works, as their name implies, are such as may reasonably be expected to be remunerative, and they include all the larger irrigation systems. Their capital cost is provided from loan funds, and not from the relief funds mentioned above. In the seventeen years ending 1896–97 the capital expenditure on such works was Rx.10,954,948, including a sum of Rx.1,742,246 paid to the Madras Irrigation Company as the price of the Kurnool-Cuddapah canal, a work which can never be financially productive, but which nevertheless did good service in the famine of 1896–97 by irrigating 87,226 acres. In the famine year 1877–78 the area irrigated by productive canals was 5,171,497 acres. In the famine year 1896–97 the area was 9,571,779 acres, including an area of 123,087 acres irrigated on the Swat river canal in the Punjab. The revenue of the year 1879–80 was nearly 6 per cent. on the capital outlay. In 1897–98 it was $7\frac{1}{2}$ per cent. In the same seventeen years Rx.2,099,253 were spent on the construction of protective irrigation works, not expected to be directly remunerative, but of great value during famine years. On four works of this class were spent Rx.1,649,823, which in 1896–97 irrigated 200,733 acres, a valuable return then, although in an ordinary year their gross revenue does not cover their working expenses. Minor works may be divided into those for which capital accounts have been kept and those where they have not. In the seventeen years ending 1896–97, Rx.827,214 were spent on the former, and during that year they yielded a return of 9·13 per cent. In the same year the irrigation effected by minor works of all sorts showed the large area of 7,442,990 acres. Such are the general statistics of outlay, revenue, and irrigated area up to the end of 1896–97. The Government might well be congratulated on having through artificial means ensured in that year of widespread drought and famine the cultivation of 27,326 square miles, a large tract even in so large a country as India.

Some description will now be given of the chief of these irrigation works. Beginning with the Punjab, the province in which most progress has been made, the great Sutlej canal, which irrigates the country to the left of that river, was opened in 1882, and the Western Jumna canal (perhaps the oldest in India) was extended into the dry Hissar and Sirsa districts, and generally improved so as to increase by nearly 50 per cent. its area of irrigation between 1878 and 1897. Perhaps this is as much as can well be done with the water at command for the country between the Sutlej and the Jumna, and it is enough to secure it for ever from famine. The Bari Doab canal, which irrigates the Gurdaspur, Amritsar, and Lahore districts, has been enlarged and extended so as to double its irrigation since 1877–78. The Chenab canal was only begun in 1889–90, and is finished. In 1896–97 it irrigated 520,279 acres, and yielded a revenue of 6·75 per cent. on the capital cost. In constructing this canal an experiment was made which proved a great success. Former canals were made in populous districts where the people were ready at once to take the water offered to them. The Chenab canal flows through what was practically a desert. Doubt was expressed as to whether colonists from more populous tracts would migrate to the banks of the new canal. But these doubts soon vanished, and in 1897 550,000 acres had been allotted to new settlers, while there were many more applicants. A much smaller work, but one of great interest, is the Swat river canal in the Peshawar valley. It was never expected that this would be a remunerative work, but it was thought for political reasons expedient to construct it, in order to induce turbulent frontier tribes to settle down into peaceful agriculture. This has had a great measure of success, and the canal itself has proved remunerative, irrigating 123,0C0 acres in 1896–97. Another great canal drawing its water from the Jhelum will irrigate the country between that river and the Chenab. It is intended to irrigate 424,000 acres, and the capital cost is estimated at Rx.1,228,000. A much greater scheme than any of the above is that of the Sind Sagar canal, which it is proposed to draw from the left bank of the Indus opposite Kalabagh, to irrigate 1,750,000 acres at a cost of Rx.6,000,000. Another great canal scheme under consideration in the Punjab proposes to take off from the right bank of the Sutlej, and to irrigate about 600,000 acres in the Montgomery and Multan districts, at

a cost of Rx.2,500,000. These three last projects would add 2,774,000 acres to the irrigated area of the province, and as they would flow through tracts almost unpeopled, they would afford a most valuable outlet for the congested districts of Northern India. In addition to these great perennial canals, much has been done since 1878 in enlarging and extending what are known as the "inundation canals" of the Punjab, which utilize the flood waters in the rivers during the monsoon season, and are dry at other times. By these canals large portions of country throughout most of the Punjab are brought under cultivation, and the area thus watered has increased from about 180,000 to 500,000 acres since 1878.

It is on inundation canals such as these that the whole cultivation of Sind depends. In 1878 the area was about 1,500,000 acres; in 1896–97 it had increased to 2,484,000 acres. This increase was not due to famine in Sind, for that rainless province depends always on the Indus, as Egypt does on the Nile, and where there is no rainfall there can be no drought. But the famine prices obtained for agricultural produce doubtless gave an impetus to cultivation. In Sind, too, there is room for much increase of irrigation. It has been proposed to construct two new canals, the Jamrao and the Shikárpur, and to improve and extend three existing canals—Nasrat, Naulakhi, and Dad. The total cost of these five projects, some of which are now in progress, will be Rx.1,596,682, and the extension of irrigation is estimated at 660,563 acres.

Turning from the basin of the Indus to that of the Ganges, the commissioners appointed to report on the famine of 1896–97 found that in the country between the Ganges and the Jumna little was left to be done beyond the completion of some distributary channels. The East India Company's great work, the Ganges canal, constructed between 1840 and 1854, before there was a mile of railway open in India, still holds its place unsurpassed among later irrigation work for boldness of design and completeness of execution, a lasting monument to the genius of Sir Proby Cautley, an officer of the Bengal Artillery but a born engineer. Ever since 1870 consideration has been given to projects for irrigating the fertile province of Oudh by means of a great canal to be drawn from the river Sarda. The water is there in abundance, the land is well adapted for irrigation, but as there is a considerable rainfall, it is doubtful whether the scheme would prove remunerative, and a large section of the landowners have hitherto opposed it, as likely to waterlog the country. Among the four protective works of irrigation which were said above to have irrigated 200,733 acres in 1896–97, one of the most important is the Betwa canal, in the parched district of Bundelkhand. This canal has cost Rx.428,086, and causes an annual loss to the state in interest and working expenses of about Rx.20,000. It irrigated, however, in 1896–97 an area of 87,306 acres, raising crops valued at Rx.231,081, or half the cost of the canal, so it may be said to have justified its construction. A similar canal from the river Ken in the same district has long been under consideration, but was not yet sanctioned in 1901. Proceeding farther east, we find very satisfactory progress in the irrigation of southern Behar, effected by the costly system of canals drawn from the river Sone. In 1877–78 these canals irrigated 241,790 acres. Rapid progress was not expected here, and 792,000 acres was calculated as being the maximum area that could be covered with the water supply available. In the five years preceding 1896–97 the average irrigated area was 392,921 acres, and during that year the area was 555,156 acres.

The canal system of Orissa was never expected to be remunerative, since in five years out of six the local rainfall is sufficient for the rice crop. In 1878–79 the area irrigated was 111,250 acres, and the outlay up to date was Rx.1,750,000. In 1896–97 the area was 185,048 acres, and the capital outlay amounted to Rx.2,623,703. It should be mentioned in favour of these canals that although the irrigation is not of yearly value, they supply very important water communication through a province which, from its natural configuration, is not likely to be soon intersected by railways. If, moreover, such a famine were again to occur in Orissa as that of 1866–67, there would be no doubt of the value of these fine canals.

In the Madras Presidency and in Mysore irrigation has long assumed a great importance, and the engineering works of the three great deltas of the Godaveri, Kistna, and Kaveri, the outcome of the genius and indefatigable enthusiasm of Sir Arthur Cotton, have always been quoted as showing what a boon irrigation is to a country. In 1878 the total area of irrigation in the Madras Presidency amounted to about 5,000,000 acres. The irrigation of the eight productive systems was 1,680,178 acres, and the revenue Rx.739,778. In 1898 there were ten of these systems, with an irrigation area, as shown by the accompanying table, of 2,685,915 acres, and a revenue of Rx.1,163,268:—

Irrigation.	Area Watered.	Total Revenue.	Total Expenditure.	Net Revenue.	Capital and Indirect Charges	Percentage of Net Revenue to Capital.
Major Works—	Acres.	Rx.	Rx.	Rx.	Rx.	
1. Godaveri Delta .	779,435	328,443	68,376	260,067	1,297,807	19 15
2. Kistna " .	520,373	254,579	74,142	180,437	1,319,166	13·18
3. Penner Weir System .	70,464	28,160	5,037	23,123	189,919	7·59
4. Sangam System .	76,277	32,627	7,037	25,590	385,601	3·68
5. Kurnool Canal .	47,008	15,622	12,404	3,218	2,171,740	·15
6. Barur Tank System	4,421	1,162	385	777	4,250	1 39
7. Kaveri Delta . .	989,808	434,346	43,464	390,882	199,458	44·87
8. Srivaikuntam System .	41,668	19,349	4,680	14,669	147,192	5·45
9. Periyar Project .	89,143	37,526	10,751	26,775	852,914	·27
10. Rushikulya Canal .	67,318	11,454	3,678	7,776	464,423	·54
Total . .	2,685,915	1,163,268	229,954	933,314	7,032,470	7·88
Minor Works—						
23 Works for which Capital and Revenue Accounts are kept . .	535,813	200,558	34,655	165,903	1,693,878	4·44
Minor Works for which such Accounts are not kept . .	3,131,009	830,175	193,295	636,880	...	...
Grand Total .	6,352,737	2,194,001	457,904	1,736,097	...	...

In the three great deltas, and the small southern one that depends on the Srivaikuntam weir over the river Tumbraparni, extension and improvement works have been carried on. The Sangam and Penner systems depend on two weirs on the river Penner in the Nellore district, the former about 18 miles above and the latter just below the town of Nellore. The former irrigates on the left, the latter on the right bank of the river. This district suffered severely in the famine of 1877–78, and the irrigation works were started in consequence. The Barur tank system in the Salem district was also constructed after the famine of 1877–78. As yet it has not fulfilled expectations. The Periyar scheme has for its object both the addition of new irrigation and the safeguarding of that which exists in the district of Madura, a plain watered by means of a great number of shallow tanks drawing their supply from a very uncertain river, the Vaigai. This river takes its rise on the eastern slopes of the Ghat range of mountains, and just opposite to it, on the western face of the range, is the source of the river Periyar. The rainfall on the west very much exceeds that on the east, and the Periyar

used to find its way by a short torrent course to the sea, rendering no service to mankind. Its upper waters are now stemmed by a masonry dam 178 feet high, forming a large lake, at the eastern end of which is a tunnel 5700 feet long piercing the watershed, and discharging 1600 cubic feet per second down the eastern side of the mountains into the river Vaigai. No bolder or more original work of irrigation has been carried out in India, and the credit of it is due to Colonel J. Pennycuick, C.S.I. The dam and tunnel were works of unusual difficulty. The country was roadless and uninhabited save by wild beasts, and fever and cholera made sad havoc of the working parties; but it was successfully accomplished. The last of those given in the table above was not expected to be remunerative, but it should prove a valuable protective against famine. The system consists of weirs over the rivers Gulleri, Mahanadi, and Rushikulya in the backward province of Ganjam, south of Orissa. From these weirs flow canals altogether about 127 miles long, which, in connexion with two large reservoirs, are capable of irrigating 120,000 acres. The works were not yet finished in 1901, but already irrigated 67,318 acres.

In addition to all these great engineering systems, southern India is covered with minor works of irrigation, some drawn from springs in the sandy beds of rivers, some from the rainfall of half a square mile ponded up in a valley. In other cases tanks are fed from neighbouring streams, and the greatest ingenuity is displayed in preventing the precious water from going to waste.

Allusion has been already made to the canals of Sind. Elsewhere in the Bombay Presidency, in the Deccan and Gujarat, there are fewer facilities for irrigation than in other parts of India. The rivers are generally of uncertain volume. The cost of storage works is very great. The population is backward, and the black soil is of a nature that in ordinary years can raise fair crops of millet and maize without artificial watering. Up to the end of 1896–97 the capital spent on the irrigation works of the Deccan and Gujarat was Rx.2,616,959. The area irrigated that year was 262,830 acres. The most important works are the Mutha and Nira canals in the Poona district.

In Upper Burma three productive irrigation works have been proposed—the Mandalay, the Shwebo, and the Mon canals, of which the first was in progress in 1901. It was estimated to cost Rx.323,280, and to irrigate 72,000 acres. The area estimated from the whole three projects is 262,000 acres, situated in the only part of Burma that is considered liable to famine.

(C. S. M.)

IV. United States.

On account of the aridity of the climate throughout the greater part of the western third of the United States, the practice of agriculture is dependent upon an artificial supply of water. On most of the country west of the 97th meridian and extending to the Pacific Ocean less than 20 inches of rain falls each year. The most notable exceptions are in the case of a narrow strip west of the Cascade Range and of some of the higher mountain masses. In ordinary years the climate is too dry for successful cultivation of the field crops, although under favourable conditions of soil and cultivation there are certain areas where cereals are grown by what is known as "dry farming." The eleventh census of the United States, 1890, showed that 3,564,416 acres were irrigated in 1889. This included only the lands from which crops were produced. Besides this, there were probably 10 million acres under irrigation systems constructed in whole or in part. An estimate for the year 1899 gave the following figures of area cropped by irrigation, these being, in round numbers :—

Arizona	180,000
California	1,500,000
Colorado	1,250,000
Idaho	500,000
Montana	800,000
Nevada	500,000
New Mexico	200,000
Oregon	300,000
Utah	500,000
Washington	100,000
Wyoming	500,000
Total	6,330,000

In addition to the area above given, about 100,000 acres are under irrigation in what is known as the subhumid region, east of the states above mentioned and including portions of the states of North and South Dakota, Nebraska, Kansas, and Texas, and the territory of Oklahoma.

The greater part of these lands is irrigated by canals or ditches built by individuals acting singly or in co-operation with their neighbours, or by corporations. The national and state governments have not built any works of reclamation excepting where the Federal Government, through the Indian department, has constructed irrigation ditches for Indian tribes, notably the Crow Indians of Montana. A few of the state governments, such, for example, as Colorado, have built small reservoirs or portions of canals from internal improvement funds.

The construction of irrigation canals and ditches has for the most part been brought about by farmers joining to plough out or dig ditches from the rivers, descending on a gentle grade. The cost of those under 5 feet in width has been less than \$500 per mile, and from 5 to 10 feet in width, \$1500 per mile. Some of the corporations constructing works for the sale of water have built structures of notable size, such, for example, as the Sweetwater and Hemet dams of southern California, the Bear river canal of Utah, and the Arizona canal, taking water from Salt river, Arizona. The cost of bringing water to the land has averaged about \$8 per acre where the ordinary ditches have been built. The owners of extensive works have charged from \$12 to \$20 per acre and upwards for so-called "water rights," or the privilege to take water from the canal, this covering cost of construction.

Besides the first cost of construction, the irrigator is usually called upon to pay annually a certain amount for maintenance, which may often be worked out by labour on the canal. The cost ranges from 50 cents to \$1 per acre; or, with incorporated companies, from \$1·50 to \$2·50 per acre and upwards. The largest expense for water rights and for annual maintenance is incurred in southern California, where the character of the crops, such as citrus fruits, and the scarcity of the water makes possible expensive construction and heavy charges. The legal expense for the maintenance of water rights is often large because of the interminable suits brought during the times of water scarcity. The laws regarding water in most of the arid states are indefinite or contradictory, being based partly on the common law regarding riparian rights, and partly upon the Spanish law allowing diversion of water from natural streams. Few fundamental principles have been established, except in the case of the state of Wyoming, where there is an official charged with the duty of ascertaining the amount of water in the streams and apportioning this to the claimants in the

order of their priority of appropriation for beneficial use.

Irrigation has progressed to such an extent, that in the year 1900 there remained few localities where water could not be easily or cheaply diverted from creeks and rivers for the cultivation of farms. The claims for the available supply from small streams now exceed the water to be had in the latter part of the irrigating season. There remain large rivers and opportunities for water storage which can be brought under irrigation at considerable expense. The large canals and reservoirs built by corporations have, however, rarely been successful from a financial standpoint, and irrigation construction during the latter part of the decade 1890–99 was relatively small.

Owing to the difficulty and expense of securing water from running streams by gravity systems, a great variety of methods has been developed of pumping water by windmills, gasoline or hot-air engines, and steam. Ordinary reciprocating pumps are commonly employed, and also air lifts and similar devices for raising great quantities of water to a height of from 20 to 50 feet. For greater depths the cost is usually prohibitive. Throughout the Great Plains region, east of the Rocky Mountains, and in the broad valleys to the west, windmills are extensively used, each pumping water for from 1 to 5 acres of cultivated ground. In a few localities, notably in South Dakota, the Yakima valley of Washington, San Joaquin, and San Bernardino valleys of California, San Luis valley of Colorado, and Utah valley of Utah, water from artesian wells has also been used for the irrigation of from 1 to 160 acres. The total acreage supplied by such means is probably less than 1 per cent. of that watered by gravity systems.

The development of irrigation has in part been retarded by the improper or wasteful use of water. On permeable soils, especially those of the terrace lands along the valleys, the soluble salts commonly known as alkali are gradually leached out and carried by the percolating waters towards the lower lands, where, reaching the surface, the alkali is left as a glistening crust or as pools of inky blackness. Farms adjacent to the rivers are for a time increased in richness by the alkaline salts, which in diffuse form may be valuable plant foods, and then suddenly become valueless when the concentration of alkali has reached a degree beyond that which the ordinary plants will endure.

The conditions governing the practice of irrigation vary widely in different parts of the arid region of the United States, and may best be summed up by taking the larger political divisions in geographical order.

In the states of *Oregon* and *Washington* there is great diversity of climate. The western third of these states, extending from the sea-coast to the tops of the Cascade Range, is humid, and in the valleys crops are successfully raised, although the yield per acre is increased by irrigation during the summer droughts. Fully two-thirds of the area of these states lies east of the Cascade Range, and the broad valleys and open plains are arid, the rainfall being from 8 to 12 inches per annum. Irrigation is practised wherever water can be diverted from the streams—notably the Yakima river of Washington and its tributaries rising in the Cascade Mountains. In the eastern part of these states wheat and other cereals are raised without irrigation, owing to peculiar conditions of soil. Columbia river and its principal tributary, Snake river, have ample water-supply for navigation, but these streams have cut deep gorges or cañons, and the water cannot be taken out upon the adjacent plateaus. A small amount is pumped by water-wheels, irrigating orchards and gardens on the narrow strip of bottom land between the river and the high cliffs.

In *Idaho* agriculture by irrigation is practised on the lava-covered plains in the southern portion of the state and in the valleys of streams tributary to Snake river. This stream, issuing from the mountains of Wyoming, flows for a time on the surface of the lava, and then by a series of falls, of which the principal are American and Shoshone, descends into narrow cañons. In the upper part of its course the greater part of the summer flow is diverted for the irrigation of lands in south-eastern Idaho. In the south-western part of the state waters are taken from Boise, Payette, and Weiser rivers.

In *Montana* agriculture is confined mainly to valleys at the headwaters of Missouri river. The Gallatin, Madison, and Jefferson rivers, which unite at Threeforks to form the Missouri, each supply numerous ditches and systems of canals. The small streams which issue from the eastern front of the main range of the Rocky Mountains are also used, the principal of these being the Teton, Sun, Marias, and Milk. Along the Missouri itself the difficulties of diverting water are such that irrigation has been practised only to a small extent. Along the Yellowstone, in the southern part of the state, where the fall of the stream is considerable, irrigation canals of considerable size have been taken out. In the vicinity of Miles City a small area is watered from artesian wells.

In the state of *Wyoming* the general altitude is greater than that of any other part of the United States, and, as a consequence, agricultural operations are limited by the short growing season. Irrigation is, however, practised in the valleys in the northern part of the state, where the altitude is relatively low, particularly in the country east of the Bighorn Range, water being obtained from streams flowing from these mountains. On the Laramie plains, whose altitude is 7000 feet and upwards, irrigation, mainly of forage crops, is practised. Water is taken also from Laramie river by means of a tunnel through the Laramie Hills out on the plains, in the vicinity of Wheatland, which lies about 70 miles northerly from Cheyenne, the capital of the state. The irrigation of forage crops is also practised throughout the mountain valleys of the state.

In the state of *Colorado* irrigation is practised in the valleys and on the plains immediately adjacent to the Rocky Mountains front, water being had from the small streams which form the South Platte river, or, to the south of this, the Arkansas river. On the divide between these streams, cereals, and occasionally field crops, are raised by dry farming. Great success has been had in the cultivation of the potato by irrigation in the vicinity of Greeley, and in the production of melons of superior quality and in enormous quantities near Rockyford. In the western portion of the state orchards are irrigated in the lower or more open valleys, the country being notable for the production of peaches and apples. In the San Luis valley, in the southern part of the state, whose altitude is over 7500 feet, wheat is raised by using the waters of the Rio Grande, and to a small extent by water-supply from artesian wells.

The state of *Utah*, lying in the centre of the arid region, affords typical examples of irrigation. Here the system of artificially applying water to the soil to any considerable extent was first practised by people emigrating from humid regions. The Mormons on coming into the country in 1847 found that crops could not be raised without water, and, forced by circumstances, developed methods suited to the physical conditions. The principal streams used are those issuing from the Wasatch Range and flowing towards the west into the valleys of Utah and Great Salt lakes. From each of these creeks or rivers water has been diverted, mainly by community effort, and used upon the lands surrounding the Mormon settlements. Until recently there have been no corporate enterprises, all of the construction having been done by associations of irrigators. Since 1890, however, a few large irrigation works have been built by outside or foreign capital, but these were financially unsuccessful. In the north-eastern portion of the state, in Cache valley, the lowlands are irrigated, and the high terrace lands are used for raising winter wheat without an artificial supply of moisture. In the southern part of the state, along the streams of the high plateaus, irrigation is practised in a small way; and in the extreme south-western corner, in the vicinity of St George, a small amount of cotton is reported to be produced by the aid of irrigation.

The state of *Nevada*, lying west of Utah, and between it and Colorado, contains the largest proportion of desert land and the smallest available water-supply. The principal river is the Humboldt, which flows south-westerly across the state, and along which irrigation is practised in a crude way, mainly for the production of grass. The principal part of the population of the state is in the extreme western angle adjacent to California. The Truckee, Carson, and Walker rivers, issuing from the mountains of California, are used in the low valleys, the excess water collecting in sinks and disappearing by evaporation.

California contains not only the largest area irrigated, but offers examples of the most complete utilization of water, especially in the southern end, where high-class citrus fruits are produced. Along the north-western coast the climate is humid, and there is also ample precipitation upon the high mountains extending along the eastern side of the state. The great interior valley, drained by the Sacramento river coming from the north and the San Joaquin from the south, is arid, and crops must be irrigated. Along the foothills on the eastern side of the valley ample water can usually be obtained from the streams issuing from the high sierras. The water of many of these was diverted during the period of active

gold-mining, from 1850 to 1870, and expensive dams and canals built for bringing out water to the placer mines. With the decline of these, following the enforcement of the *débris* law, these works were gradually used and enlarged for irrigation, particularly of orchards and vineyards. In the southern or upper end of the San Joaquin valley raisin grapes have been particularly successful.

Southern California is shut off from the remainder of the state by the abrupt Sierra Madre Range, giving it a distinctive climate, which has been found to be particularly adapted to the cultivation of oranges, lemons, walnuts, and various high-priced fruits. Water is relatively scarce, and the works for its development and control are most elaborate and expensive. The perennial streams are small, but during floods these have brought down from the high mountains enormous quantities of sand and gravel, which have been built up in great alluvial cones around the edges of the valleys. These pervious deposits are filled with water percolating from the mountains, which has been brought to the surface and used for irrigation by means of wells, some of which overflow, or by tunnels driven on a slightly ascending grade, out of which the percolating water flows. Large reservoirs have also been constructed for holding the flood waters. Owing to the unprecedented drought of 1898 and 1899, most of these were dry during the summer of the latter year. Water is also pumped from the sandy beds of the streams, and is used with great care and economy in the ratio of one miner's inch, or a fiftieth of a cubic foot, per second per acre, on every 5 to 10 or even more acres.

The territory of *Arizona*, lying south of Utah and east of California, has in the southern portion the warmest climate of the arid region. The northern part of the territory consists of high plateaus, deeply cut by the Colorado river and its tributaries. The Gila river flows westerly across the southern part of the state, receiving its water-supply from the abrupt southern front of the high plateau region, its principal tributaries being Salt and Verde rivers. Extensive irrigation works have been built to divert water below the junction of these latter streams, covering what is known as Salt river valley, within which the capital, Phœnix, is located. Water is also taken out of the Gila river by a number of canals rising both above and below the junction with Salt river. The principal crops are alfalfa and cereals, a considerable area being planted in groves of oranges and similar fruits.

The territory of *New Mexico* lies south of Colorado, and receives a considerable portion of its water from the Rio Grande, which rises in this state and flows south through New Mexico, and then forms the international boundary between the republics of the United States and Mexico. This river passes alternately through deep cañons and open valleys, and in the latter its waters are diverted by ditches, many of which are of unknown antiquity, having been constructed by the Pueblo, or town-dwelling, Indians long before the advent of the white men. The diversion and loss of water through evaporation is so complete, that during a portion of the year the river is dry in southern New Mexico and along the border of western Texas. To the east of the Rio Grande is the Pecos, its main tributary from the north. The waters of this stream come largely from enormous springs, and irrigation systems of considerable size have been constructed, using the greater part of the flow.

The country lying to the east of the states and territories just described consists for the most part of the high plains, which extend from the Rocky Mountains range, sloping gradually into the Mississippi valley. Perennial streams are comparatively rare, and are at long distances from each other. The plains region is, however, underlaid over considerable areas by water-bearing sands and gravels, and wells are successfully dug or drilled to depths of from 50 to 300 feet. Water is pumped from these by innumerable windmills of various descriptions, most of them being of the modern rapid-running steel construction, designed to operate in light breezes, automatically throwing themselves out of the wind during sudden storms. Most of the water is pumped for cattle, the area being devoted mainly to grazing. Irrigation is practised in a small way at the home ranches scattered over this so-called semi-arid or sub-humid region, which is included in the states of North and South Dakota, Nebraska, Kansas, Texas, and the territory of Oklahoma. On these high plains there are occasional years when the rainfall is sufficient for the production of crops, and settlements have during these seasons rapidly sprung up, to be abandoned after the continued drought through a succession of years has destroyed the crops.

Irrigation is not wholly confined to the arid and semi-arid regions of the west, but is practised in the rice-fields of Texas and Louisiana bordering upon the Gulf of Mexico. It is also employed to a small extent in the orange groves of Florida, water being pumped and distributed in pipes. At various points along the Atlantic coast it is used in the production, on the sandy soils, of the early vegetables shipped to the larger cities, and even as far north as Massachusetts is employed in the raising of cranberries, and on water meadows. (F. H. N.)

Irun, a frontier town of north-east Spain, in the province of Guipuzcoa, 8 miles east of San Sebastian. A new suburb has sprung up between the station and the old town, where the massive town hall deserves notice. The local industries (tanning, brandy, brick and paper manufactures) have developed rapidly, but Irun derives its prosperity from the fact that it is the most important custom-house in Spain for the overland trade with the rest of Europe. The receipts amount to about 10 per cent. of the whole proceeds of the Peninsular customs. Irun is also on the chief highway for travellers and almost all the mails. The town was the first in Spain to use electricity for general lighting. It is the terminus of some important narrow-gauge mining railways and steam tramways, placing it in communication with the mining districts of Guipuzcoa and Navarre, and with the highlands of both provinces, where timber is extracted in larger amount every year from splendid forests of oak, beech, and pine. Population (1897), 9739.

Irvine, a royal and parliamentary burgh (Ayr group) of Ayrshire, Scotland, near the mouth of the river Irvine, 27 miles south-west of Glasgow by rail. In 1892 Irvine was restored to the status of a port. In 1898, 1119 vessels of 98,532 tons entered, and 1108 vessels of 97,791 tons cleared. Shipbuilding is a growing industry; 12 vessels of 3410 tons were launched in 1899. Additions have been made to the town hall, and the academy is being replaced by a larger secondary school. A bronze statue of Burns (who learned flax-dressing in Irvine) was unveiled in 1896. There are three excellent golf courses. Population (1881), 8498; (1901), 9603.

Irving, Sir Henry (John Henry Brodribb), (1838——), English actor, son of Samuel Brodribb, was born at Keinton, near Glastonbury, 6th February 1838. After a few years' schooling he became, at the age of fourteen, a clerk in the offices of a firm of East India merchants in London. His strong taste and capacity for acting soon led him to give up all idea of a commercial career, and before he was nineteen he obtained his first engagement on the stage. This was in a theatrical company at Sunderland, where, on 29th September 1856, he made his first appearance at the New Royal Lyceum Theatre. For stage purposes he discarded his patronymic of Brodribb, and was known as Henry Irving (eventually assuming Irving as an additional surname by royal licence in June 1889). For ten years he went through an arduous but invaluable training in various stock companies in Edinburgh, Glasgow, Liverpool, and Manchester, amassing a very wide and diversified store of experience, as may be inferred from the fact that during this period he performed between five and six hundred parts. By degrees (especially in Manchester, where he had achieved a marked success as Rawdon Scudamore in Boucicault's *Hunted Down*) his ability gained recognition, with the result that in October 1866 he was offered and accepted an engagement at the St James's Theatre, London, to play Doricourt in *The Belle's Stratagem.* A year later he joined the company of the newly-opened Queen's Theatre, Long Acre, where he acted in association with Charles Wyndham, J. L. Toole, Lionel Brough, John Clayton, Mr and Mrs Alfred Wigan, Miss Ellen Terry, and Miss Nelly Farren. Two years of useful work with them were followed by short engagements at the Haymarket and Drury Lane, until, in December 1869, Irving made his first conspicuous success as Mr Chevenix in H. J. Byron's play, *Uncle Dick's Darling*, at the Gaiety Theatre. He followed this up by a masterly performance of Digby Grand in *The Two Roses* at the Vaudeville Theatre in 1870. In 1869 he married Miss Florence O'Callaghan, daughter of a

surgeon-general in the Indian army; his two sons, Henry Brodribb and Laurence, both afterwards taking to the stage. In 1871 began his association with the Lyceum Theatre with his engagement to support Miss Bateman there, under her father's management. The fortunes of the house were at a very low ebb when the tide was turned by Irving's instantaneous success in *The Bells*, which "ran" for 150 nights. With Miss Bateman, Irving was seen in *Charles I.*, *Eugene Aram*, *Richelieu*, and eventually, in October 1874, in *Hamlet*. The unconventionality of his performance as Hamlet (during a "run" that lasted for 200 nights) aroused keen discussion, and singled him out as the most interesting actor of his day. In 1875 he was seen, still with Miss Bateman, as Macbeth; in 1876 as Othello, and as Philip in Tennyson's *Queen Mary;* in 1877 in *Richard III.* and *The Lyons Mail.* In 1878 the Bateman *régime* at the Lyceum ceased, and in December of that year Irving opened the theatre under his own management. Assisted by Miss Ellen Terry, whose Ophelia was the first of a long series of triumphs for her, he revived *Hamlet* for a further run of a hundred nights; and after appearing in *The Corsican Brothers*, he produced *The Merchant of Venice* in 1879. His Shylock was as much discussed as his Hamlet had been, the dignity with which he invested the Jew pleasing some as much as it offended others. This performance, and Miss Terry's as Portia, placed them definitely at the head of their profession. Two years later (after the production of Tennyson's *The Cup*, a revival of *Othello* in conjunction with the American actor Edwin Booth, and *Romeo and Juliet*) there began a period at the Lyceum Theatre which may be reckoned as in some respects the most notable in the recent history of the English stage. The Lyceum stage management, and the brilliancy of its productions in scenery, dressing, and accessories, were revelations in the art of *mise-en-scène*. *Much Ado about Nothing* in the autumn of 1882 was followed by *Twelfth Night* in 1884, *Olivia* in 1885, *Faust* in 1886, *The Dead Heart* in 1889, and *Ravenswood* in 1890; the winter of 1888 was remarkable for the production of *Macbeth*, and the year 1892 for two very fine assumptions of the characters of Wolsey in *Henry VIII.* and King Lear, followed by a peculiarly striking and dignified performance (in 1893) of the part of Becket in Tennyson's play of that name. During these years, too, Irving, with the whole Lyceum company, paid several visits to America, which met with conspicuous success and were repeated in succeeding years. The chief remaining novelties at the Lyceum during Irving's sole managership (the theatre passed, at the beginning of 1899, into the hands of a limited liability company) were Comyns Carr's *King Arthur* in 1895, *Cymbeline*, in which Irving played Iachimo, in 1896, Sardou's *Madame Sans-Gêne* in 1897, *Peter the Great*, a play by Laurence Irving, the actor's second son, in 1898, and Conan Doyle's *Waterloo* (1894). The new *régime* at the Lyceum was signalized by the production of Sardou's *Robespierre* in April 1899, in which Irving reappeared after a serious illness, and in 1901 by an elaborate revival of *Coriolanus*. Both on and off the stage he always maintained a high ideal of the actor's profession, and in 1895 he received the honour of knighthood. He was also the recipient of honorary degrees from the universities of Dublin, Cambridge, and Glasgow. Sir Henry Irving's acting, apart from his genius as a presenter of plays, has divided criticism, opinions differing as to the extent to which his undoubted mannerisms of voice and deportment interfered with or assisted the expression of his ideas. So strongly marked a personality as his could not help giving its own colouring to whatever part he might assume, but the richness and originality of this colouring at its best cannot be denied, any more than the spirit and intellect which characterized his renderings. At the least, extraordinary versatility must be conceded to an actor who could satisfy exacting audiences in *rôles* so widely different as Digby Grand and Louis XI., Richard III. and Becket, Benedick and Shylock, Mathias and Dr Primrose.

Irvington, a town of Essex county, New Jersey, U.S.A., in the north-eastern part of the state, just west of Newark, of which it is a residential suburb. Population (1900), 5255, of whom 993 were foreign-born.

Isabella II. (1830– ——), ex-queen of Spain, was born in Madrid on 10th October 1830. She was the eldest daughter of Ferdinand VII., king of Spain, and of his fourth wife, Maria Christina, a Neapolitan Bourbon, who became queen-regent on 29th September 1833, when her daughter, at the age of three years, was proclaimed on the death of the king. Queen Isabella succeeded to the throne because Ferdinand VII. induced the Cortes to assist him in setting aside the Salic law, which the Bourbons had introduced since the beginning of the 18th century, and to re-establish the older succession law of Spain. The brother of Ferdinand, Don Carlos, the first pretender, fought seven years, during the minority of Isabella, to dispute her title, and her rights were only maintained through the gallant support of the army, the Cortes, and the Liberals and Progressists, who at the same time established constitutional and parliamentary government, dissolved the religious orders, confiscated the property of the orders and of the Jesuits, disestablished the Church property, and attempted to restore order in finances. After the Carlist war the queen-regent, Christina, resigned to make way for Espartero, the most successful and most popular general of the Isabelline armies, who only remained regent two years. He was turned out in 1843 by a military and political *pronunciamiento*, led by Generals O'Donnell and Narvaez, who formed a cabinet, presided over by Joaquin Maria Lopez, and this Government induced the Cortes to declare Isabella of age at thirteen. Three years later the Moderado party or Castilian Conservatives made their queen marry, at sixteen, her cousin, Prince Francisco de Assisi de Bourbon (1822–1902), on the same day (10th October 1846) on which her younger sister married the duke of Montpensier. These marriages suited the views of France and Louis Philippe, who nearly quarrelled in consequence with Great Britain; but both matches were anything but happy. Queen Isabella reigned from 1843 to 1868, and that period was one long succession of palace intrigues, back-stairs and ante-chamber influences, barrack conspiracies, military *pronunciamientos* to further the ends of the political parties—Moderados, who ruled from 1846 to 1854, Progressists from 1854 to 1856, Union Liberal from 1856 to 1863; Moderados and Union Liberal quickly succeeding each other and keeping out the Progressists so steadily that the seeds were sown which budded into the revolution of 1868. Queen Isabella II. often interfered in politics in a wayward, unscrupulous manner that made her very unpopular. She showed most favour to her reactionary generals and statesmen, to the Church and religious orders, and was constantly the tool of corrupt and profligate courtiers and favourites who gave her court a deservedly bad name. She went into exile at the end of September 1868, after her Moderado generals had made a slight show of resistance that was crushed at the battle of Alcolea by Marshals Serrano and Prim. The only redeeming traits of Queen Isabella's reign were a war against Morocco, which ended in an advantageous treaty and some cession of territory; some progress in public works, especially railways; a slight improvement in commerce and

finance. Isabella was induced to abdicate in Paris on 25th June 1870 in favour of her son, Alphonso XII., and the cause of the restoration was thus much furthered. She had separated from her husband in the previous March. She continued to live in France after the restoration in 1874. On the occasion of one of her visits to Madrid during Alphonso XII.'s reign she began to intrigue with the politicians of the capital, and was peremptorily requested to go abroad again.

Isar, a river of Bavaria, in many respects the national stream of the Bavarian people. It rises in the Alps of Tirol, north-east from Innsbruck, at an altitude of 5840 feet, winds in deep, narrow glens and gorges through the Alps, and at Tölz (2100 feet), due north from its source, enters the Bavarian plain, which it traverses in a generally north and north-east direction, flowing through Munich and past Freising and Landshut, and pours its green waters into the Danube immediately below Deggendorf after a course of 219 miles. The area of its drainage basin is 38,200 square miles. Below Munich the stream is 140 to 350 yards wide, and is studded with islands. It is not navigable, except for rafts. The total fall of the river is 4816 feet.

Isbarta (ancient BARIS), the chief town of the Hamid-abad sanjak of the Konia viláyet, in Asia Minor, well situated on the edge of a fertile plain at the foot of Aghlasún Dagh. It suffered severely from the earthquake of 16th–17th January 1889. Population 20,000 (Moslems 13,000, Christians 7000). Baris was once an important city, striking coins, and the seat of a bishopric.

Ischia, an island of Italy, on the north-west side of the Gulf of Naples, with far-famed mineral baths. In 1881 it was visited by an earthquake, and in 1883 by another, much more destructive, which laid Casamicciola almost entirely in ruins. The town has, however, been rebuilt, and contains about 3500 inhabitants. The town of Ischia has about 7000, and Forio more than 7000 inhabitants.

Ischl, a watering-place in the district of Gmunden (Salzkammergut), Upper Austria, the favourite summer resort of the Emperor Francis Joseph I. and the imperial family. The population of the commune in 1890 was 8473, in 1900 9646, German, and mostly Catholic. There are about 18,000 visitors during the season. The salt-works yield about 15,000 tons of salt annually, of a value of £120,000, in addition to large quantities of brine. There is a rack-and-pinion mountain railway (1893) from St Wolfgang to the top of the neighbouring Schafberg.

Isère, a department in the south-east of France, crossed by the Alps of the Dauphiné, and watered by the Rhône and the Isère.

Area, 3180 square miles. The population decreased from 581,680 in 1886 to 563,813 in 1901. Births in 1899, 10,936, 552 of them illegitimate; deaths, 11,127; marriages, 4078. There were in 1896 1576 schools, with 85,000 pupils, and the illiterate constituted 1⅓ per cent. of the population. The area under cultivation comprised, in 1896, 1,504,926 acres, of which 756,169 acres were plough-land and 61,660 vineyards. The land in wheat produced the value of £1,064,000; rye, £122,000; buckwheat, £65,000; oats, £198,000; vines, £720,000; potatoes, £483,280; natural pastures, £480,000. Among the industrial cultures, those of linen and hemp deserve mention. The live stock in 1899 included 33,540 horses, 213,540 cattle, 163,550 sheep, 40,850 pigs, and 63,720 goats. Mining in 1898 produced 204,000 metric tons of fuel, of the value of £120,000, 9000 tons of turf, 12,000 tons of iron; and the industry in metals, which is developed in this department, produced 35,000 tons of cast iron, 2000 tons of iron, and 5300 tons of steel. Among the other industries the most important are the manufacture of gloves, cement, and paper (Rives). Vizille is an important weaving centre. Grenoble, the capital, had (1900) 68,052 inhabitants.

Iserlohn, a town of Prussia, province of Westphalia, 30 miles by rail east-north-east of Barmen. It is a seat of the metal industries, especially in iron, steel, and brass, manufactures of needles and pins, lamp and similar fittings, bronze ornaments, furniture, and tinned and silvered wares. In 1883 a bronze statue of the Emperor William I. was unveiled. Population (1885), 20,102; (1900), 27,268.

Isfahán (older form ISPAHÁN), an important province of Persia, situated in the centre of the country, and bounded on the S. by Fars, on the E. by Yezd, on the N. by Kashán, Natanz, and Irák, and on the W. by the Bakhtiári district and Arabistán. It pays a yearly revenue of about £100,000, and its population exceeds 500,000. It is divided into twenty-five districts, its capital, the town of Isfahán, forming one of them. These twenty-five districts, some very small and consisting of only a little township and a few hamlets, are Isfahán, Jai, Barkhár, Kaháb, Kararaj, Baraán, Rúdasht, Marbin, Lenján, Kerven, Rár, Kiar, Mizdej, Ganduman, Somairam, Jarkúyeh, Ardistan, Kúhpáyeh, Najafabad, Komisheh, Chadugan, Varzek, Tokhmaklu, Gurji, Chinarúd. Most of these districts are very fertile, and produce great quantities of wheat, barley, rice, cotton, tobacco, and opium. Lenján, west of the city of Isfahán, is the greatest rice-producing district; the finest cotton comes from Jarkúyeh; the best opium and tobacco from the villages in the vicinity of the city. ISFAHÁN, the capital of the above province, is situated on the Záyendeh river, in 32° 36′ N. and 51° 40′ E., at an elevation of 5370 feet. Its population, excluding that of the Armenian colony of Julfa, on the right bank of the river (about 4000), is about 82,000. In 1882 it was 73,654 (37,529 males, 36,125 females), including 5883 Jews (2930 males, 2953 females). It is divided into 37 mahallehs (parishes), and has 210 mosques and colleges, 84 caravanserais, 150 public baths, and 68 flour mills. The water-supply is principally from open canals led off from the river, and from streams and canals which come down from the hills in the north-west. The name of the Isfahán river was originally Zendek, "the great"; it then became Zindeh, "the living," and is now Záyendeh, "the life-giving." The river flows into the Gavkháni depression, about 70 miles east of Isfahán, and its volume of water at Isfahán during the spring season has been estimated at 60,000 cubic feet per second; in autumn the quantity is reduced to one-third. (A. H.-S.)

Ishim, a district town of West Siberia, government of Tobolsk, 276 miles E.N.E. of Kurgan railway station, on a river of the same name, tributary, on the left, of the Irtysh. The fair is one of the most important in Siberia, being the central market for the fertile prairies around, and its returns are estimated at £500,000. Population (1897), 7161.

Ishpeming, a city of Marquette county, Michigan, U.S.A., in the Marquette iron range, at an altitude of 1400 feet. It is on the Chicago and North-Western, the Duluth, South Shore and Atlantic, and the Lake Superior and Ishpeming railways. In and about the city are great iron mines of red hematite ore, and the business of mining and shipping the ore is practically the only industry. Population (1880), 6039; (1890), 11,197; (1900), 13,255, of whom 5970 were foreign-born.

Ismail Pasha (1830–1895), Khedive of Egypt, was born at Cairo on the 31st of December 1830, being the second of the three sons of Ibrahim and grandson of Mehemet Ali. After receiving a European education at Paris, where he attended the École d'État-Major, he returned home, and on the death of his elder brother

became heir to his uncle Said Mohammed, the Vali of Egypt. Said, who apparently conceived his own safety to lie in ridding himself as much as possible of the presence of his nephew, employed him in the next few years on missions abroad, notably to the Pope, the Emperor Napoleon III., and the Sultan of Turkey. In 1861 he was despatched at the head of an army of 14,000 to quell an insurrection in the Sudan, and this he successfully accomplished. On the death of Said, on 18th January 1863, Ismail was proclaimed viceroy without opposition. Being of an Orientally extravagant disposition, he found with considerable gratification that the Egyptian revenue was vastly increased by the rise in the value of cotton which resulted from the American Civil War, the Egyptian crop being worth about £25,000,000 instead of £5,000,000. Besides acquiring luxurious tastes in his sojourns abroad, Ismail had discovered that the civilized nations of Europe made a free use of their credit for raising loans. He proceeded at once to apply this idea to his own country by transferring his private debts to the State and launching out on a grand scale of expenditure. Egypt was in his eyes the ruler's estate which was to be exploited for his benefit and his renown. His own position had to be strengthened, and the country provided with institutions after European models. To these objects Ismail applied himself with energy and cleverness, but without any stint of expense. During the 'sixties and 'seventies Egypt became the happy hunting-ground of self-seeking financiers, to whose schemes Ismail fell an easy and a willing prey. In 1866 he obtained from the Sultan of Turkey, in exchange for an increase in the tribute, a firman giving him the title of Khedive, and changing the law of succession to direct descent from father to son; and in 1873 he obtained a new firman making him virtually independent. He projected vast schemes of internal reform, remodelling the Customs system and the Post Office, stimulating commercial progress, creating a sugar industry, introducing European improvements into Cairo and Alexandria, building palaces, entertaining lavishly, and maintaining an opera and a theatre. It has been calculated that, of the total amount of debt incurred by Ismail for his projects, about 10 per cent. may have been sunk in works of permanent utility—always excluding the Suez Canal. Meanwhile the opening of the Canal had given him opportunities for asserting himself in foreign Courts. On his accession he refused to ratify the concessions to the Canal Company made by Said, and the question was referred in 1864 to the arbitration of Napoleon III., who awarded £3,800,000 to the company as compensation for the losses they would incur by the changes which Ismail insisted upon in the original grant. Ismail then used every available means, by his own undoubted powers of fascination and by judicious expenditure, to bring his personality before the foreign sovereigns and public, and he had no little success. He was made G.C.B. in 1867, and in the same year visited Paris and London, where he was received by Queen Victoria and welcomed by the Lord Mayor; and in 1869 he again paid a visit to England. The result was that the opening of the Canal in November 1869 enabled him to claim to rank among European sovereigns, and to give and receive royal honours: this excited the jealousy of the Sultan, but Ismail was clever enough to pacify his overlord. In 1876 the old system of consular jurisdiction for foreigners was abolished, and the system of mixed courts was introduced, by which European and native judges sat together to try all civil cases without respect of nationality. In all these years Ismail had governed with *éclat* and profusion, spending, borrowing, raising the taxes on the fellaheen, and combining his policy of independence with dazzling visions of Egyptian aggrandizement. In 1874 he annexed Darfur, and was only prevented from extending his dominion into Abyssinia by the superior fighting power of the Abyssinians. But at length the inevitable financial crisis came. A national debt of over one hundred millions sterling (as opposed to three millions when he became viceroy) had been incurred by the Khedive, whose fundamental idea of liquidating his borrowings was to borrow at increased interest. The bondholders became restive. Judgments were given against the Khedive in the international tribunals. When he could raise no more loans he sold his Suez Canal shares (in 1875) to Great Britain for £3,976,582; and this was immediately followed by the beginning of foreign intervention. In December 1875 Mr Stephen Cave was sent out by the British Government to inquire into the finances of Egypt, and in April 1876 his report was published, advising that in view of the waste and extravagance it was necessary for foreign Powers to interfere in order to restore credit. The result was the establishment of the Caisse de la Dette. In October Mr (afterwards Lord) Goschen and M. Joubert made a further investigation, which resulted in the establishment of Anglo-French control. A further commission of inquiry by Major Baring (afterwards Lord Cromer) and others in 1878 culminated in Ismail making over his estates to the nation and accepting the position of a constitutional sovereign, with Nubar as Premier, Mr (afterwards Sir Charles) Rivers Wilson as Finance Minister, and M. de Blignières as Minister of Public Works. Ismail professed to be quite pleased. "Egypt," he said, "is no longer in Africa; it is part of Europe." The new *régime*, however, only lasted six months, and then Ismail dismissed his ministers, an occasion being deliberately prepared by his getting Arabi (*q.v.*) to foment a military *pronunciamiento*. England and France took the matter seriously, and insisted (May 1879) on the reinstatement of the British and French ministers; but the situation was no longer a possible one: the Tribunals were still giving judgments for debt against the Government, and when Germany and Austria showed signs of intending to enforce execution the Governments of Great Britain and France perceived that the only chance of setting matters straight was to get rid of Ismail altogether. He was first advised to abdicate, and a few days afterwards (26th June), as he did not take the hint, he received a telegram from the Sultan (who had not forgotten the earlier history of Mehemet Ali's dynasty), addressed to him as ex-Khedive, and informing him that his son, Tewfik, was his successor (see also EGYPT, sections *Finance* and *History*). He at once left Egypt for Naples, but eventually was permitted by the Sultan to retire to his palace of Ermighian on the Bosphorus. There he remained, more or less a State prisoner, till his death on 2nd March 1895. Ismail was a man of undoubted ability and remarkable powers. But beneath a veneer of French manners and education he remained throughout a thorough Oriental, though without any of the moral earnestness which characterizes the better side of Mahommedanism. Some of his ambitions were not unworthy, and though his attitude towards Western civilization was essentially cynical, he undoubtedly helped to make the Egyptian upper classes realize the value of European education. Moreover, spendthrift as he was, it needed—as is pointed out in Milner's *England in Egypt*—a series of unfortunate conditions to render his personality as pernicious to his country as it actually became. "It needed a nation of submissive slaves, not only bereft of any vestige of liberal institutions, but devoid of the slightest spark of the spirit of liberty. It needed a bureaucracy which it would

have been hard to equal for its combination of cowardice and corruption. It needed the whole gang of swindlers—mostly European—by whom Ismail was surrounded." It was his early encouragement of Arabi, and his introduction of swarms of foreign concession-hunters, which precipitated the "national movement" that led to British occupation. His greatest title to remembrance in history must be that he made European intervention in Egypt compulsory. (H. CH.)

Ismailiya, a town of Lower Egypt, the central station on the Suez Canal, on Lake Timsah, about 50 miles from the Mediterranean and the Red Sea. It is connected by rail with Cairo and Suez, and by steam tramway and steamer with Port Said; has sprung up since 1860 in connexion with the works of the Suez Canal; and has a population of nearly 4000. The town is divided into two quarters by the road leading from the landing-place to the railway station, and has numerous public offices, warehouses, and other buildings, including a palace of the Khedive, which was used as a military hospital during the British occupation of the place in 1882, but is now in a dilapidated state.

Ismay, Thomas Henry (1837–1899), British shipowner, was born at Maryport, Cumberland, on 7th January 1837. He received his education at Croft House School, Carlisle, and at the age of sixteen was apprenticed to Messrs Imrie & Tomlinson, shipowners and brokers, of Liverpool. He then travelled for a time, visiting the ports of South America, and on returning to Liverpool started in business for himself. In 1867 he took over the White Star line of Australian clippers, and in 1868, perceiving the great future which was open to steam navigation, established, in conjunction with William Imrie, the Oceanic Steam Navigation Company, which has since become famous as the White Star Line. While continuing the Australian service, the firm determined to engage in the American trade, and to that end ordered from Messrs Harland & Wolff, of Belfast, the first *Oceanic*, which was launched in 1870. This vessel, which had a gross tonnage of 3807, was the first to have her saloon accommodation amidships, and may fairly be said to have marked an era in North Atlantic travel. The same is true of the successive types of steamer which Mr Ismay, with the co-operation of the Belfast shipbuilding firm, subsequently provided for the American trade. Each one of these made its appearance only when the time was fully ripe, and in consequence each was a complete success. In 1875 the *Britannic* and *Germanic*—the first ships over 5000 tons, always excepting the *Great Eastern*, whose great fault was that she was built some forty years before she was needed—were added to the fleet, and performed the journey between Liverpool and New York in about seven and a half days. Fourteen years later came the *Teutonic* and *Majestic*, of nearly double the tonnage, which reduced the time of the passage to less than six days. In another ten years, in 1899, Mr Ismay's supreme creation, the second *Oceanic*, started on her maiden voyage, to be followed two years later, though after his death, by the *Celtic*. These two vessels were the largest that had ever been built up to that date, the former being a mail boat of 21 knots speed and a gross tonnage of over 17,000 tons, and the latter a cargo steamer (capable, nevertheless, of carrying over 3000 persons) of nearly 21,000 tons gross register. To Mr Ismay is mainly due the credit of the arrangement by which some of the fastest ships of the British mercantile marine are held at the disposal of the Government in case of war. The origin of this plan dates from the Russo-Turkish war, when there seemed a likelihood of England being involved in hostilities with Russia, and when, therefore, Mr Ismay offered the Admiralty the use of the White Star fleet. In building the *Teutonic* and *Majestic* their possible employment as armed merchant cruisers was kept specially in view, and the former, armed with sixteen guns, took part in the naval review held at Spithead in 1897 in honour of the Diamond Jubilee of Queen Victoria. Mr Ismay died at Birkenhead on 23rd November 1899.

Ismid, Nicomedia, in Asia Minor, the chief town of the Khoja Ili sanjak of Constantinople, situated on rising ground near the head of the Gulf of Ismid. The sanjak has an area of 4650 square miles, and a population of 225,000 (Moslems 131,000, Christians and others 94,000). It is an agricultural district, producing cocoons, tobacco, &c., and there are large forests of oak, beech, and fir. Near Yalova there are hot mineral springs, much frequented in summer. The town is connected by the lines of the Anatolian Railway Company with Haidar Pasha, the western terminus, and with Angora, Konia, and Smyrna. It contains a fine 16th-century mosque, built by the celebrated architect Sinan. The population is 20,000 (Moslems 9500, Christians 8000, Jews 2500). There is a British consular agent. The head of the Gulf of Ismid is gradually silting up. The dockyard was closed in 1879, and the port of Ismid is now at Darinje, $3\frac{3}{4}$ miles distant, where the Anatolian Railway Company have established their workshops and have built docks and a quay.

Isola del Liri, a town of the province of Caserta, Campania, Italy, on an island enclosed between two arms of the Liris (Garigliano), 26 miles north-west of Cassino by rail. It is the seat of large paper, cloth, and woollen mills, which derive their motive power from falls in the river. There are also steel and iron works. Population (1881), 4569; (1899), about 6000.

Ispahán. See Isfahán.

Israëls, Josef (1824– ——), Dutch painter, was born at Groningen, of Hebrew parents, on 27th January 1824. His father intended him to be a man of business, and it was only after a determined struggle that he was allowed to enter on an artistic career. However, the attempts he made under the guidance of two second-rate painters in his native town—Buÿs and Van Wicheren—while still working under his father as a stockbroker's clerk, led to his being sent to Amsterdam, where he became a pupil of Jan Kruseman and attended the drawing class at the academy. He then spent two years in Paris, working in Picot's studio, and returned to Amsterdam. There he remained till 1870, when he moved to The Hague for good. Israels is justly regarded as one of the greatest of Dutch painters. He has often been compared to J. F. Millet. As artists, even more than as painters in the strict sense of the word, they both, in fact, saw in the life of the poor and humble a motive for expressing with peculiar intensity their wide human sympathy; but Millet was the poet of placid rural life, while in almost all Israëls' pictures we find some piercing note of woe. Duranty said of them that "they were painted with gloom and suffering." He began with historical and dramatic subjects in the romantic style of the day. By chance, after an illness, he went to recruit his strength at the fishing-town of Zandvoort near Haarlem, and there he was struck by the daily tragedy of life. Thenceforth he was possessed by a new vein of artistic expression, sincerely realistic, full of emotion and pity. Among his more important subsequent works are "The Zandvoort Fisherman" (in the Amsterdam gallery), "The

"David singing before Saul." By Joseph Israëls.
(*From a Photograph by Guy de Coral and Co., Amsterdam.*)

Silent House" (which gained a gold medal at the Brussels Salon, 1858), and "Village Poor" (a prize at Manchester). In 1862 he achieved great success in London with his "Shipwrecked," purchased by Mr Young, and "The Cradle," two pictures of which the *Athenæum* spoke as "the most touching pictures of the exhibition." We may also mention among his maturer works "The Widower" (in the Mesdag collection), "When we grow Old" and "Alone in the World" (Amsterdam gallery), "An Interior" (Dordrecht gallery), "A Frugal Meal" (Glasgow museum), "Toilers of the Sea," "A Speechless Dialogue," "Between the Fields and the Seashore," "The Bric-à-brac Seller" (which gained medals of honour at the great Paris Exhibition of 1900). "David Singing before Saul" is one of his latest works, and seems to hint at a return on the part of the venerable artist to the Rembrandtesque note of his youth (see PLATE). As a water-colour painter and etcher he produced a vast number of works which, like his oil paintings, are full of deep feeling. They are generally treated in broad masses of light and shade, which give prominence to the principal subject without any neglect of detail.

Istria (German, *Istrien*), a margraviate and crownland of the Cisleithan part of the Austro-Hungarian monarchy. It forms, together with Görz, Gradisca, and Trieste, the so-called Austro-Illyrian Küstenland or littoral, united for certain administrative purposes. The population in 1880 was 292,006, and in 1890, including garrison of 8630 men, 317,610, or 166·44 inhabitants per square mile. The proportion of females to males was 923 to 1000. Forty-five per cent. are Serbo-Croatians, 38 per cent. Italians, 15 per cent. Slovenes, and 2 per cent. Germans. The population is almost exclusively Roman Catholic (99·7 per cent.), a small minority being Greek Orthodox, Protestant, and Jewish. The population in 1900 was 344,173. In 1897 the marriage-rate was 7·64, the birth-rate 40·36, or excluding still-births 39·48, and the death-rate 23·99. Of the births, 3·97 per cent. were illegitimate. The birth-rate steadily increases. Istria sends 5 representatives to the Reichsrath (3 Italians and 2 Slovenes). The provincial Diet is composed of 21 Italians and 12 Croatians. (For education, communications, &c., see KÜSTENLAND.) Only 11·7 per cent. of the population are engaged in industry, principally shipbuilding, the recovery of salt from sea water (nearly 15 per cent. of the total Austrian product), fish-curing, and mining (lignite and alum). Naturally fishing and seafaring pursuits are also considerable resources in a territory possessing such important harbours as Pirano, Pola, and Lussin-Piccolo, and visited by a total in all its ports and roadsteads of nearly 40,000 vessels, with a total tonnage of 2½ millions. The chief agricultural resources are viticulture, oil, fig-, fruit-, and corn-growing, and cattle-breeding (principally sheep, horned cattle, mules and asses, and pigs). The timber trade is now of less importance, but gall-nuts, oak bark, cork, and charcoal are largely exported.

(Æ. O'N.)

Iswar Chandra (1820–1891), writer and social reformer of Bengal, was born at Birsinha (Midnapur district) in 1820. He was removed to Calcutta by his father at the age of nine, was admitted in the Sanskrit College, and carried on his studies in the midst of privations and extreme poverty. In 1839 he finished his education, and obtained the title of *Vidyasagar* (= "Ocean of learning") after passing a brilliant examination, and in 1841 was appointed head Pandit of Fort William College in Calcutta. In 1847 appeared his first great literary work in Bengali prose, *The Twenty-five Tales of a Betal.* This was succeeded by his *Sakuntala* in 1855, and by his greatest work, *The Exile of Sita*, in 1862. These works are marked by a literary grace and beauty which Bengali prose had never known before. The literature of Bengal, previous to the 19th century, was entirely in verse. Ram Mohan Roy, the religious reformer of Bengal, created the literary prose of Bengal early in the 19th century by his numerous translations and religious tracts; and Iswar Chandra Vidyasagar and his fellow-worker, Akhay Kumar Datta, added to its power and beauty about the middle of that century. These three writers are generally recognized as the fathers of Bengali prose literature. As a social reformer and educationist, too, Iswar Chandra made his mark. He associated himself with Drinkwater Bethune in the cause of female education; and the management of the girls' school, called after Bethune, was entrusted to him in 1850. And when Rosomoy Datta, a cultured and distinguished Indian gentleman of the time, resigned the post of secretary to the Sanskrit College of Calcutta, a new post of principal was created, and Iswar Chandra was appointed to it. Iswar Chandra's influence in the education department was now unbounded. He simplified the method of learning the Sanskrit language, and thus spread a knowledge of that ancient tongue among his countrymen. He was consulted in all educational matters by Sir Frederick Halliday, the first Lieutenant-Governor of Bengal. And when the great scheme of education under Sir Charles Wood's despatch of 1854 was inaugurated in India, Iswar Chandra established numerous aided schools under that scheme in the most advanced districts of Bengal. But a greater task than literary work or educational reforms claimed the attention of the patriot and reformer. The wrongs of Hindu widows awakened his sympathy and aroused his energies. He had discovered that the ancient Hindu scriptures did not enjoin perpetual widowhood, and in 1855 he startled the Hindu world by his work on the *Remarriage of Hindu Widows.* Such a work, from a learned and presumably orthodox Brahman, caused the greatest excitement, but Iswar Chandra remained unmoved amidst a storm of indignation. Associating himself with the most influential men of the day, like Prosonno Kumar Tagore and Ram Gopal Ghosh, he appealed to the British Government to declare that the sons of remarried Hindu widows should be considered legitimate heirs. The British Government responded; the Act was passed in 1856, and some years after Iswar Chandra's own son was married to a widow. In the last years of his life Iswar Chandra wrote works against Hindu polygamy; but that custom, never very widely prevalent, is dying out without the aid of any legislative measures. Iswar Chandra was as well known for his charity and wide philanthropy as for his educational and social reforms. His vast income, derived from the sale of school-books, was devoted almost entirely to the succour of the needy: hundreds of young men owed their education to him; hundreds of widows depended on him for their daily bread. The Indian Government made him a Companion of the Indian Empire in 1877. He died in 1891.

(R. C. D.)

ITALY.

Geography and Statistics.

According to the calculation of the Italian Military Geographical Institute, the area of the kingdom of Italy is 110,646 square miles. Pending the completion of the Institute's labours, the Statistical Bureau provisionally measured the outstanding provinces and districts whose area has still to be exactly determined. The following table indicates the areas thus calculated for the several provinces (sixty-nine in number), the population of each according to the censuses of 31st December 1881 and of 9th February 1901, together with the density per square mile at that date. (The larger divisions or compartments in which the provinces are grouped are not officially recognized.)

Provinces and Compartments.	Area, Square Miles.	Population. 1881.	1901.	Density per Square Mile, 1901.
Alessandria	1,950	729,710	812,022	416·42

Kingdom of Italy	110,623	28,459,628	32,449,754	293·28

Of the total, 91,393 square miles represent the Italian mainland, the remainder belonging to the islands, mainly Sicily and Sardinia. The total length of the land frontiers is 1203 miles, the Italo-French frontier being 302 miles long, the Italo-Swiss 417 miles, and the Italo-Austrian 484. The length of the mainland coast-line is 2100 miles, and that of the islands 2169 miles.

No change has taken place in the chief territorial divisions, and the kingdom is still divided into 69 provinces, 284 regions (of which 197 are classed as *circondarii* and 87 as districts), 1806 administrative divisions (*mandamenti*), and 8262 communes. The *mandamenti* or administrative divisions no longer correspond to the judicial divisions (*mandamenti giudiziarii*), which in November 1891 were reduced in number from 1806 to 1535 by a law which provided that the judicial reform should not modify existing administrative and electoral divisions.

Population.—The population of Italy, which, according to the census of 1881, was 28,459,628, was, according to the census of 9th February 1901, 32,449,754. In consequence of this increase in number, the average density of the population has increased from 257·21 per square mile in 1881, to 293·28 in 1901. The density, however, varies considerably, as will be seen in the above table. Modes of life also vary considerably, according as the inhabitants live scattered over the country, congregated in rural towns and villages, or aggregate themselves around farmhouses of importance. In Venetia, Emilia, the Marches, Umbria, and Tuscany the proportion of concentrated population is only from 40 to 55 per cent.; in Piedmont, Liguria, and Lombardy the proportion rises to from 70 to 76 per cent.; in southern Italy, Sicily, and Sardinia it attains a maximum of from 76 to 93 per cent. The majority of Italians (19,000,000) live in communes of less than 10,000 inhabitants, and only 3,000,000 in communes of more than 50,000. As a rule, they prefer living in hamlets and small towns to isolated life in the country or the urban life of large cities.

The population of the chief provincial towns, according to the census of 9th February 1901, is given in the following table:—

Town.	Population.	Town.	Population.
Alessandria	71,293	Messina	149,823
Ancona	56,825	Milan	491,460
Aquila	21,215	Modena	64,941
Arezzo	44,350	Naples	563,731
Ascoli Piceno	28,882	Novara	44,928
Avellino	23,790	Padua	82,283
Bari	79,693	Palermo	310,352
Belluno	18,649	Parma	49,370
Benevento	24,650	Pavia	35,372
Bergamo	45,785	Perugia	61,453
Bologna	152,009	Pesaro	25,115
Brescia	70,618	Piacenza	36,064
Cagliari	53,734	Pisa	61,279
Caltanissetta	44,600	Porto Maurizio	7,207
Campobasso	15,046	Potenza	16,520
Caserta	32,729	Ravenna	63,839
Catania	149,694	Reggio (di Calabria)	44,417
Catanzaro	31,887		
Chieti	26,406	Reggio (Emilia)	59,176
Como	38,902	Rome	463,000
Cosenza	21,402	Rovigo	11,174
Cremona	37,651	Salerno	42,736
Cuneo	27,182	Sassari	38,178
Ferrara	87,697	Siena	28,678
Florence	204,950	Sondrio	8,700
Foggia	53,351	Syracuse	32,074
Forlì	43,457	Teramo	24,578
Genoa	234,800	Turin	335,639
Girgenti	25,069	Trapani	60,257
Grosseto	9,600	Treviso	34,004
Lecce	32,485	Udine	37,933
Leghorn	98,505	Venice	151,841
Lucca	74,718	Verona	74,261
Macerata	22,806	Vicenza	44,261
Mantua	29,160		
Massa	26,325	Total	5,614,587

Occupations.—In the census of 1871 all inhabitants of communes with a population of less than 6000 were assigned to the rural population, and those of larger communes to the urban population. In southern Italy, however, the population of many peasant communes exceeds 6000, and it is scarcely possible to classify the inhabitants of Italy except according to their occupations. Thus:—

	Percentages of Population (persons of nine years and upwards).
Agriculture, hunting, and fishing	38
Manufactures and mining	19
Trade and transport	3
Public and private employees (including domestic servants)	4
Carry forward	64

	Percentages of Population (persons of nine years and upwards).
Brought forward	64
Liberal professions, education, fine arts, and public worship	2
Capitalists and proprietors	4
Army and navy	1
Other professions	1
Unclassified (including housewives, students, &c.)	28
	100

Although the percentage of Italians employed in agriculture and allied occupations is probably destined, as in other countries, to undergo some diminution in favour of the percentage employed in trade and industry, the generality of the population of Italy preserves its rural character.

Marriages, Births, Deaths.—The proportion of marriages in Italy showed a slight diminution between 1881 and 1899, the rate having been 8·11 per 1000 in the former and 7·42 in the latter year. During the same period the birth-rate decreased from 38·10 to 34·27 per 1000, and the death-rate from 27·63 to 22·15. Thus:—

Year.	Marriages.		Births.		Deaths.	
	Total.	Per 1000 Inhabitants.	Total.	Per 1000 Inhabitants.	Total.	Per 1000 Inhabitants.
1881	230,143	8·11	1,081,125	38·10	784,181	27·63
1885	233,931	8·03	1,125,970	38·67	787,217	27·03
1891	227,656	7·53	1,132,139	37·42	795,327	26·29
1895	228,152	7·36	1,092,102	35·22	783,813	25·28
1898	219,597	6·96	1,070,074	33·89	732,265	23·19
1899	235,665	7·42	1,088,558	34·27	703,393	22·15

The marriage-rate varies considerably in the different Italian regions. It is highest in Umbria, Apulia, the Abruzzi and Molise, and Calabria; and lowest in Liguria, Piedmont, and Venetia. The highest birth-rate is found in Apulia, the Marches, Calabria, the Abruzzi and Molise; the lowest in Piedmont, Liguria, and Sardinia. The death-rate is lowest in the northern provinces, and particularly in Venetia and Piedmont; and highest in Apulia, in the Abruzzi and Molise, and in Sardinia. Out of 1,070,074 births registered in 1898, 1,002,812 were legitimate and 67,262 illegitimate. The latter total comprises natural children recognized by their fathers (38,900), as well as the unrecognized and the foundlings. The percentage of illegitimate births tends to decrease; thus:—

Year.	Illegitimate Births.	Per Cent.
1881	79,508	7·35
1891	80,041	7·07
1895	70,539	6·46
1897	70,199	6·37
1898	67,262	6·29
1899	66,852	6·14

The regions which give the highest proportion of illegitimates continue to be the Romagna, with 203·6 per 1000; Lazio, with 217·6 per 1000; and Umbria, with 142·2 per 1000.

The fall in the death-rate is principally due to improvement of hygienic and sanitary conditions (better water supply, improved drainage, &c.), and partly to the increase of general welfare.

Emigration.—The movement of emigration may be divided into two currents, temporary and permanent—the former going chiefly towards neighbouring European countries, and consisting of manual labourers, the latter towards trans-oceanic countries, principally Brazil, Argentina, and the United States. These emigrants remain abroad for several years, even when they do not definitively establish themselves there. They are composed principally of peasants, unskilled workmen, and other manual labourers. The provinces which furnish the chief contingents of emigrants to non-European countries are those of Genoa, Cosenza, Potenza, Salerno, Avellino, Campobasso, and Catanzaro; but Venetia, Lombardy, and Piedmont also provide considerable numbers. As shown by the following table, there was, on the whole, a tendency towards increased emigration during the last quarter of the 19th century. The principal causes are the growth of population, and the over-supply of and low rates of remuneration for manual labour in various Italian provinces:—

Year.	Temporary Emigration.		Permanent Emigration.	
	Total No. of Emigrants.	Per every 100,000 of Population.	Total No of Emigrants.	Per every 100,000 of Population.
1881	94,225	333	41,607	147
1885	80,164	276	77,029	265
1891	118,111	389	175,520	578
1895	123,668	397	169,513	543
1896	123,862	394	183,620	585
1897	134,426	425	165,429	523
1898	156,928	493	126,787	398
1899	177,031	553	131,308	410

From the next table will be seen the direction of emigration in the years specified:—

Emigrants to	1897.	1898.	1899.
European Countries . . .	125,310	144,528	162,899
North Africa	2,457	3,251	4,566
United States and Canada. .	47,139	56,703	64,177
Brazil, Argentine, Central and other South American States .	123,075	76,737	74,897
"America" (country not named)	1,080	1,753	860
Other Countries . . .	794	743	940
Total	299,855	283,715	308,339

Up to 1901, Italian emigration was regulated by the Law of 1888, which dealt principally with the relations between emigration agents and the emigrants, and made some provision for the protection of the latter during the journey. At the beginning of 1901 a new Emigration Law was finally sanctioned by Parliament. It suppressed emigration agents, strictly established the liability of the steamship companies towards the emigrants, provided for proper sanitation on board emigrant ships, and created a special Commissionership of Emigration (attached to the Ministry for Foreign Affairs) to administer the provisions of the Law, and to deal with the foreign countries whither emigrants chiefly go, and to fix the passenger rates.

Agriculture.—Accurate statistics with regard to the area occupied in different forms of cultivation are difficult to obtain, both on account of their varied and piecemeal character and from the lack of a complete cadastral survey. A complete survey was ordered by the Law of 1st March 1886, but many years must elapse before its completion. The law enabled provinces most heavily burdened by land tax to accelerate their portion of the survey, and to profit by the reassessment of the tax on the new basis. In eighteen provinces, therefore, the cadastral operations are completed; they have been begun, and in some cases nearly completed, in twenty-one other provinces. Thirty provinces are still outstanding. An idea of the probable effects of the new survey may be gathered from the fact that the assessments in the four provinces of Mantua, Ancona, Cremona, and Milan, which formerly amounted to a total of 36,367,400 lire, are now 69,702,000, an increase of 91 per cent. Similar results will probably be attained in the other provinces of the kingdom. Of the total area of Italy, 71 per cent., or 20,283,000 hectares out of 28,704,843 hectares, are classed as "productive." The unproductive area comprises 16 per cent. of the total area, or 4,647,451 hectares; and the uncultivated area 13 per cent., or 3,774,392 hectares.

The cultivated area of Italy may be divided into five agrarian regions or zones, named after the variety of tree culture which flourishes in them, and around which the herbaceous cultures most readily group themselves. (1) Proceeding from south to north, the first zone is that of the *agrumi* (oranges, lemons, and similar fruits). It comprises a great part of Sicily. In Sardinia it extends along the southern and western coasts. It predominates along the Ligurian Riviera from Bordighera to Spezia, and on the Adriatic, near S. Benedetto del Tronto and Gargano, and, crossing the Italian shore of the Ionian Sea, prevails in some regions of Calabria, and terminates around the gulfs of Salerno, Sorrento, and Naples. (2) The region of *olives* comprises the internal Sicilian valleys and part of the mountain slopes; in Sardinia, the valleys near the coast on the south-east, south-west, and north-west; on the mainland it extends from Liguria and from the southern extremities of the Romagna to Cape Santa Maria di Leuca in Apulia, and to Cape Spartivento in Calabria. Some districts of the olive region are to be found near the lakes of Upper Italy and in Venetia, and the territories of Verona, Vicenza, Treviso, and Friuli. (3) The *vine* region completes, so to speak, the orange region, wherever the olives fail to find a suitable climate. It begins on the sunny slopes of the Alpine spurs and in those Alpine valleys which are open towards the south. In Sardinia it covers the mountain slopes to a considerable height, and in Sicily covers the sides of the Madonie range, reaching the level of 1000 metres on the southern slope of Etna. The Calabrian Alps, the less rocky sides of the Apulian Murge, and the whole length of the Apennines are covered at different heights, according to their situation. The hills of Tuscany, and of Monferrato in Piedmont, produce the most celebrated Italian vintages. (4) The region of *chestnuts* extends from the valleys to the high plateaux of the Alps, along the northern slopes of the Apennines in Liguria, Modena, Tuscany, Romagna, Umbria, the Marches, and along the southern Apennines to the Calabrian and Sicilian ranges, as well as to the mountains of Sardinia. (5) The *wooded* region covers the Alps and Apennines above the chestnut level. The woods consist chiefly of pine and hazel upon the Apennines, and upon the Calabrian, Sicilian, and Sardinian mountains of oak, ilex, hornbeam, and similar trees. Between these regions of tree culture lie zones of different herbaceous culture, cereals, vegetables, and textile plants, according to the different conditions of climate and soil.

Agrarian Production.—Herbaceous cultures occupy the first place in extension and importance, covering nearly 15,000,000 hectares, or three-fifths of the productive area, and more than half the total area of Italy. Wheat stands first, with an area (in 1895) of 4,593,274 hectares. From 1884 to 1899 the wheat harvest varied between 38 and 51 million hectolitres, equal to an average of 6·5 to 11 hectolitres per hectare. In some fertile spots, however, the yield reaches 20 or even 30 hectolitres per hectare.

Next in importance to wheat comes maize, which is cultivated almost everywhere as an alternative crop. The area under maize is now about 2,000,000 hectares, and the yield approximately 27,000,000 hectolitres. During the period 1884–99 the maximum maize crop was that of 34,000,000 hectolitres in 1884, and the minimum 21,000,000 in 1894. In 1899, 31,200,000 hectolitres were produced. The average crop per hectare is between 16 and 18 hectolitres.

Rice is cultivated in low-lying, moist lands, where spring and summer temperatures are high. The Po valley and the valleys of Emilia and the Romagna are most adapted for rice, but the area is diminishing on account of the competition of foreign rice and of the impoverishment of the soil by too intense cultivation. The average area is 200,000 hectares, with an average annual crop of from 7,000,000 to 8,000,000 hectolitres. Rye, barley, and oats are less cultivated. The area under rye is about 150,000 hectares, of which about two-thirds lie in the Alpine and about one-third in the Apennine zone. The average annual crop is about 1,500,000 hectolitres. The barley zone is geographically extensive, but embraces not more than 300,000 hectares, of which half are situated in Sardinia and Sicily. The average annual production is between 10 and 11 hectolitres per hectare. Oats, which are cultivated in the Roman and Tuscan maremma and in Apulia, are used almost exclusively for horses and cattle. The area of oats cultivation is 450,418 hectares, giving a crop of 7,000,000 hectolitres, or 16 hectolitres per hectare. The other cereals, millet and *panico sorgo*, have lost much of their importance in consequence of the introduction of maize and rice. Millet, however, is still cultivated in the north of Italy, and is used as bread for agricultural labourers, and as forage when mixed with buckwheat (*sorghum saccaratum*).

The cultivation of various forms of green forage is extensive, and is divided into the two categories of temporary and perennial. The temporary includes vetches, pulse, lupine, clover, and

trifolium; and the perennial, meadow-trefoil, lupinella, sulla (*Hedysarum coronarium*), lucerne, and darnel. The natural grass meadows are extensive, and hay is grown all over the country, but especially in the Po valley. The area covered by green fodder is 5,500,000 hectares, exclusive of Alpine and flat pasturages, which cover 3,000,000 hectares. Returns for this zone of cultivation are only approximate, and, judged by the quantity of live stock in Italy, are probably below reality. According to these returns, the average annual crop of hay is 68,000,000 quintals; that of beet-root, turnips, and tuberous growths, 3,500,000 quintals; and of green fodder, 159,000,000 quintals. Seed-bearing vegetables are comparatively scarce in Italy. The principal are, white beans, which are largely consumed by the working classes; lentils, much less cultivated than beans; and green peas, largely consumed in Italy, and exported as a spring vegetable. Chick-pease are extensively cultivated in the southern provinces. These varieties of seed-bearing vegetables occupy about 200,000 hectares, and yield from 10 to 30 hectolitres per hectare. Horse beans (*vicia faba*) are grown especially in the south and in the larger islands; they occupy altogether about 400,000 hectares, and yield from 15 to 25 hectolitres per hectare.

Among tuberous vegetables the potato (*solanum tuberosum*) comes first. Some 200,000 hectares are devoted to its cultivation, the yield being from 18 to 20 tons per hectare. Turnips (*brassica rapa*) are grown principally in the central provinces as an alternative crop to wheat. They yield as much as 30 tons per hectare. Beet-root (*beta vulgaris*) is used as fodder, and yields between 20 and 30 tons per hectare. Sugar beet is extensively grown to supply the seventeen large sugar factories now existing in Italy.

Market gardening is carried on both near towns and villages, where products find ready sale, and along the great railways, on account of transport facilities.

Among the chief industrial plants cultivated in Italy must be mentioned tobacco, which grows wherever suitable soil exists. Since tobacco is a Government monopoly, its cultivation is subject to official concessions and prescriptions. In 1898 the cultivation of 134,175,000 plants was authorized, and concessions were issued by the provincial commissions for 93,258,226, but only 80,569,176 were actually planted, over an area of 4951 hectares. The gross yield for that year was 5,625,124 kilogrammes. Experiments hitherto made show that the cultivation of Oriental tobacco may profitably be extended in Italy.

The chief Italian textile plants are hemp, flax, and cotton. Hemp (*cannabis sativa*) is largely cultivated in the provinces of Turin, Ferrara, Bologna, Forlì, Ascoli Piceno, and Caserta. Bologna hemp is specially valued. More than 100,000 hectares are employed in hemp cultivation, the average crop being 800,000 quintals. Flax (*linum usitatissimum*) covers between 60,000 and 70,000 hectares, with a product, in fibre, amounting to about 200,000 quintals, or 3 quintals per hectare, and, in seed, of 18 hectolitres per hectare. Cotton (*gossypium herbaceum*), which at the beginning of the 19th century, at the time of the Continental blockade, and again during the American War of Secession, was so largely cultivated in Italy as to cover an area of 90,000 hectares, and to yield 623,000 quintals of raw cotton, has now almost completely died out, and is cultivated only in parts of Sicily and in a few southern provinces.

The most important of the ligneous plants cultivated in Italy is the vine (*vitis vinifera*), which is to be found in 7212 out of the 8262 Italian communes. The vine-growing area covers about 3,446,000 hectares. In 1898 the vintage amounted to 32,940,000 hectolitres, and in 1899 to 31,800,000 hectolitres; the maximum vintage was 38,227,000 hectolitres in 1886. Within the last few years the vine has been attacked by three terrible enemies—the *oidium Tuckeri*, the *phylloxera vastatrix*, and the *peronospora viticola*, which in rapid succession have wrought great havoc in Italian vineyards. Government and vine-growers are, however, energetically combating these scourges.

Olives are cultivated in every region of Italy except Piedmont. The olive-growing area occupies 1,033,796 hectares, yielding:—

1884–85	. .	3,323,120 hectolitres.
1896–97	. .	1,912,009 ,,
1897–98	. .	1,600,000 ,,
1898–99	. .	2,300,009 ,,
1899–1900	. .	920,000 ,,

The falling off of the crop was due to bad seasons and to insects, notably the *cycloconium oleoginum* and the *dacus oleæ*, or oil fly, which have ravaged the olive-yards. With the development of agricultural knowledge, notable improvements have been effected in the manufacture of oil. In 1895 the number of oil-mills in Italy was 14,500, and at present is probably 17,500. Between 70,000 and 80,000 workmen find employment in the mills, five-sixths of which are worked by animal power, 2000 by hydraulic, and 250 by steam power. The steam mills give the best results. Very little oil is made in Italy from oil-seeds, although a certain amount of linseed-oil is made in Lombardy, Sicily, Apulia, and Calabria; colza in Piedmont, Lombardy, Venetia, and Emilia; and castor-oil in Venetia and Sicily. The total product is calculated to be 120,000 quintals, principally used for industrial purposes, but partly in the preparation of food.

Agrumi (oranges, lemons, citrons, &c.) are cultivated especially in Sicily, Calabria, Sardinia, and Liguria. In northern and central Italy, except in the province of Brescia, they are almost non-existent. The trees are planted on irrigated soil, and the fruit gathered at various times between November and August. The area occupied in orange and lemon cultivation is calculated to be 40,000 hectares. In the quinquennium 1879–83 the number of trees was 15,698,000, and in 1890–98 17,000,000, with an average annual crop of 3,000,000,000 of fruit. In the year 1899–1900 the crop was 4,500,000,000. The value of the crop varies considerably, according to the market price. Considerable trade is done in *agro di limone*, or lemon extract, which forms the basis of citric acid. Extraction is extensively carried on in the provinces of Messina and Palermo. During recent years, however, the cultivation of *agrumi* as a whole has not given favourable results, a falling-off, amounting to some £400,000 per annum, having taken place between 1895 and 1899.

Among other fruit trees, apple-trees have special importance. In 1899 the total apple crop was calculated to be 475,930 quintals, worth £571,000. Almonds are widely cultivated in Sicily, Sardinia, and the southern provinces; walnut-trees throughout the peninsula, their wood being more important than their fruit; hazel nuts, figs, prickly pears, locust beans, and pistachio nuts are among the other fruit trees. The mulberry-tree (*morus alba*), whose leaves serve as food for silkworms, has particular importance in Italy. It is cultivated in every region, considerable progress having been made in its cultivation and in the rearing of silkworms since 1850. Silkworm-rearing establishments of importance now exist in the Marches, Umbria, in the Abruzzi, Tuscany, Piedmont, and Venetia. In 1899, 41,557,000 kilogrammes of cocoons were produced, worth £6,649,120. The chief silk-producing provinces are Lombardy (15,100,000 kilogrammes of cocoons), Venetia (8,720,000 kilogrammes), and Piedmont (7,270,000 kilogrammes). During the period 1880–99 the production oscillated about a mean of 40,000,000 kilogrammes per annum, but it is noteworthy that while, at the outset, three-fourths of the cocoons were Chinese or Japanese, almost all are now native Italian cocoons. Moreover, while the yield per cocoon tends to increase, the number of eggs hatched tends to diminish. In 1880, 1,700,000 ounces of eggs were hatched; now only 900,000 ounces are required, a result due to the selection of the species most fertile in silk, and to improved methods of culture.

Woods and Forests.—Woods and forests play an important part in Italy, especially in regard to the consistency of the soil and to the character of the watercourses. Three great zones may be distinguished—(*a*) up to 1200 feet above sea-level, (*b*) from 1200 to 3000 feet, and (*c*) from 3000 feet upwards. The first region is losing importance on account of the continual spread of land under cultivation. Nevertheless, along the Roman and Tuscan littoral, in the province of Ravenna, here and there in southern Italy, and in Sicily and Sardinia, pine, ash, and oak woods of considerable extent are to be found. In the second region the chestnut predominates, its wood being of great value and its fruit an article of popular consumption. The third region is characterized by beech and fir trees. Good timber is furnished by the pine and fir forests of the Alps and Apennines. Notwithstanding the efforts of the Italian Government to unify and co-ordinate the forest laws previously existing in the various Italian states, deforestation has continued in many parts of Italy. Between 1871 and 1898 the forest department has replanted 20,366 hectares at a cost of £205,930. Forest nurseries have also been founded. There are now forty-nine of them, covering 53 hectares, and producing on an average 7,000,000 nurselings per annum.

Live Stock.—According to an approximate calculation carried out in 1890, the number of head of live stock in Italy was 16,620,000, thus divided:—Horses, 720,000; asses, 1,000,000; mules, 300,000; cattle, 5,000,000; sheep, 6,000,000; goats, 1,800,000; swine, 1,800,000. The approximate value of this live stock was calculated to be £87,640,000, of which £55,000,000 was represented by cattle. In upper Italy cattle are principally reared in pens and stalls; in central Italy cattle are allowed to run half wild, the stall system being little practised; in the south and in the islands cattle are kept in the open air, few shelters being provided. The erection of shelters is, however, being encouraged by the State. Horse-breeding is on the increase. The State helps to improve the breeds by placing choice stallions at the disposal of private breeders at a low tariff. Cattle-breeding varies with the different regions. In the Lombard farms it is carried on intensively, *i.e.*, in stalls and enclosed spaces, on a large scale. Along the Mediterranean coast, in the south, and in the islands it is carried on in the open air.

Sheep are chiefly reared in Lazio, the Abruzzi, Apulia, Basilicata,

Calabria, and Sardinia, where extensive pasturage exists. In other provinces, where agriculture is more advanced, sheep-farming is confined to hilly districts. Old established habits prevent rapid improvement of method. The number of sheep is diminishing in Italy, especially in Apulia. Similarly, the number of goats, which are reared only in hilly regions, is decreasing, especially on account of the existing forest laws. The production of wool is less considerable than in the past, and in 1895 was estimated at 9,777,000 kg. Swine are extensively reared in many provinces, and less extensively throughout the whole peninsula. Fowls are kept on all Italian farms, and though methods are still antiquated, trade in fowls and eggs is rapidly increasing. The number of eggs exported more than doubled within the last decade of the 19th century.

The milk and cheese-making industry is acquiring great importance, especially in northern Italy, Lombardy, and Venetia, where co-operative dairy farms are numerous and flourishing. Modern methods have been generally introduced. In 1895 the production was calculated to be as follows:—Cheese, 74,328,000 kg.; butter, 15,922,000 kg.; curds, 1,874,000; other milk products, 5,278,000.

Drainage, &c.—The drainage of marshes and marshy lands has considerably extended. A law passed on 22nd March 1900 has given a special impulse to this form of enterprise by fixing the ratio of expenditure incumbent respectively upon the State, the provinces, the communes, and the owners or other private individuals directly interested. On 31st December 1897 seventy-five drainage operations had been completed, or were in course of completion, either directly or indirectly by the State. They affected a total area of 697,561 hectares, of which 309,970 had been completely drained and rendered susceptible of cultivation.

Agrarian Economics.—The Italian Federation of Agrarian Unions has greatly contributed to agricultural progress. In December 1899 the number of Unions (*Consorzii*) federated was 161, exclusive of the non-co-operative agricultural societies. Some of these unions annually purchase large quantities of merchandise for their members, especially chemical manures.

Income from land has diminished on the whole. The chief diminution has taken place in the south in regard to oranges and lemons, cereals and (for some provinces) vines. Since 1895, however, the heavy import corn duty has caused a slight rise in the income from corn lands. The principal reasons for the general decrease are the fall in prices through foreign competition and the closing of certain markets, the diseases of plants and the increased outlay required to combat them, and the growth of State and local taxation.

The relations between owners and tillers of the soil are still regulated by the ancient forms of agrarian contract, which have remained almost untouched by social and political changes. The possibility of reforming these contracts in some parts of the kingdom has been studied, in the hope of bringing them into closer harmony with the needs of rational cultivation and the exigencies of social justice.[1] The following forms of contract are most usual in the several Italian regions:—In Piedmont the *mezzadria* (*metayage*), the *terzieria*, the *colonia parziaria*, the *boaria*, the *schiavenza*, and the *affitto*, or lease, are most usual. Under *mezzadria* the contract generally lasts three years. Products are usually divided in equal proportions between the owner and the tiller. The owner pays the taxes, defrays the cost of preparing the ground, and provides the necessary implements. Stock usually belongs to the owner, and, even if kept on the half-and-half system, is usually bought by him. The peasant, or *mezzadro*, provides labour. Under *terzieria* the owner furnishes stock, implements, and seed, and the tiller retains only one-third of the principal products. In the *colonia parziaria* the peasant executes all the agricultural work, in return for which he is housed rent-free, and receives one-sixth of the corn, one-third of the maize, and has a small money wage. This contract is usually renewed from year to year. The *boaria* is widely diffused in its two forms of *cascina fatta* and *paghe*. In the former case a peasant family undertakes all the necessary work in return for payment in money or kind, which varies according to the crop; in the latter the money wages and the payment in kind are fixed beforehand. *Schiavenza*, either simple or with a share in the crops, is a form of contract similar to the *boaria*, but applied principally to large holdings. The wages are lower than under the *boaria*. In the *affitto*, or lease, the proprietor furnishes seed and the implements. Rent varies according to the quality of the soil.

In Lombardy, besides the *mezzadria*, the lease is common, but the *terzieria* is rare. The lessee, or farmer, tills the soil at his own risk; usually he provides live stock, implements, and capital, and has no right to compensation for ordinary improvements, nor for extraordinary improvements effected without the landlord's consent. He is obliged to give a guarantee for the fulfilment of his engagements. In some places he pays an annual tribute in grapes, corn, and other produce. In some of the Lombard *mezzadria* contracts taxes are paid by the cultivator.

In Venetia it is more common than elsewhere in Italy for owners to till their own soil. The prevalent forms of contract are the *mezzadria* and the lease. *Mezzadria* contracts are usually renewed year by year; if the stock belongs to the peasant, he retains all the profit from them, but if to the owner, they are held in simple partnership. In several districts, such as Padua and Rovigo, where farms are extensive, the implements and stock belong to the farmer, who gives a guarantee for the payment of rent.

In Liguria, also, *mezzadria* and lease are the chief forms of contract. Under *mezzadria*, however, live stock belongs to the owner of the soil, who pays for planting the olive-trees and provides manure. The olives, chestnuts, and other fruits usually go two-thirds to the owner and one-third to the peasant. Farm leases generally run from three to nine years, and provide compensation for certain improvements effected by the farmer.

In Emilia both *mezzadria* and lease tenure are widely diffused in the provinces of Ferrara, Reggio, and Parma; but other special forms of contract exist, known as the *famiglio da spesa*, *boaria*, *braccianti obbligati*, and *braccianti disobbligati*. Under the *mezzadria* produce is divided equally, except grapes (of which two-thirds go to the landlord) and mulberry leaves (which go to him entirely). Taxes and the cost of seed are equally divided. Stock, as a rule, belongs to the landlord. Leases are stipulated for periods varying from three to nine years, and the tenant must guarantee payment of rent. If stock, implements, fodder, and seed are furnished by the landlord, they are valued, and the tenant is obliged to restore the same value on the lapse of his lease. In the *famiglio da spesa* the tiller receives a small wage and a proportion of certain products. The *boaria* is of two kinds. If the tiller receives as much as 45 lire per month, supplemented by other wages in kind, it is said to be *boaria a salario*; if the principal part of his remuneration is in kind, his contract is called *boaria a spesa*.

In the Marches, Umbria, and Tuscany, *mezzadria* prevails in its purest form. Profits and losses, both in regard to produce and stock, are equally divided. In some places, however, the landlord takes two-thirds of the olives and the whole of the grapes and the mulberry leaves. Leasehold exists in the province of Grosseto alone. In Lazio leasehold and farming by landlords prevail, but cases of *mezzadria* and of "improvement farms" exist. In the *agro Romano*, or zone immediately around Rome, land is as a rule left for pasturage. It needs, therefore, merely supervision by guardians and mounted overseers, or *butteri*, who are housed and receive wages. Large landlords are usually represented by *ministri*, or factors, who direct agricultural operations and manage the estates. Wherever corn is cultivated, leasehold predominates. Near Velletri and Frosinone "improvement farms" prevail. A piece of uncultivated land is made over to a peasant for a period varying from 20 to 29 years. Vines and olives are usually planted, the landlord paying the taxes and receiving one-third of the produce. At the end of the contract the landlord either cultivates his land himself or leases it, repaying to the improver part of the expenditure incurred by him. This repayment sometimes consists of half the estimated value of the standing crops.

In the Abruzzi and in Apulia leasehold is predominant. Usually leases last from three to six years. In the provinces of Foggia and Lecce long leases (up to twenty-nine years) are granted, but in them it is explicitly declared that they do not imply *enfiteusi* (perpetual leasehold), nor any other form of contract equivalent to co-proprietorship. *Mezzadria* is rarely resorted to. On some small holdings, however, it exists with contracts lasting from two to six years. The landlord furnishes seed and implements, especially for oil-making, the whole being valued for restitution upon expiry of the contract. The produce is equally divided after the deduction of seed, except in the case of oil, of which the cultivator receives from one-sixth to one-fourth. Special contracts, known as *colonie inamovibili* and *colonie temporanee*, are applied to the *latifondi* or huge estates, the owners of which receive half the produce, except that of the vines, olive-trees, and woods, which he leases separately. "Improvement contracts" also exist. They consist of long leases, under which the landlord shares the costs of improvements and builds farm-houses; also leases of orange and lemon gardens, two-thirds of the produce of which go to the landlord, while the farmer contributes half the cost of farming besides the labour. Leasehold, varying from four to six years for arable land and from six to eighteen years for forest-land, prevails also in Campania, Basilicata, and Calabria. The *estaglio*, or rent, is often paid in kind, and is equivalent to half the produce of good land and one-third of the

[1] In 1899 special inquiries were carried out in regard to this subject by the Ministry of Agriculture. In 1893 a Government Commission studied and proposed changes in the existing laws with regard to agrarian contracts and labour contracts. Several reform Bills have been presented, including that of Baron Sidney Sonnino in November 1900, and that brought forward by the Zanardelli-Giolitti Cabinet in the spring of 1902.

produce of bad land. "Improvement contracts" are granted for uncultivated bush districts, where one-fourth of the produce goes to the landlord, and for plantations of fig-trees, olive-trees, and vines, half of the produce of which belongs to the landlord, who at the end of ten years reimburses the tenant for a part of the improvements effected. Other forms of contract are the *piccola mezzadria*, or sub-letting by tenants to under-tenants, on the half-and-half system; *enfiteusi*, or perpetual leases at low rents—a form which has almost died out; and *mezzadria* (in the provinces of Caserta and Benevento), upon the basis that two-thirds of the olive-oil belongs to the landlord, and varying proportions of other produce, all labour being provided by the tenant.

In Sicily leasehold prevails under special conditions. In pure leasehold the landlord demands at least six months' rent as guarantee, and the forfeiture of any fortuitous advantages. Under the *gabella* lease the contract lasts twenty-nine years, the lessee being obliged to make improvements, but being sometimes exempted from rent during the first years. *Inquilinaggio* is a form of lease by which the landlord, and sometimes the tenant, makes over to tenant or sub-tenant the sowing of corn. There are various categories of *inquilinaggio*, according as rent is paid in money or in kind. Under *mezzadria* or *metateria* the landlord divides the produce with the farmer in various proportions. The farmer provides all labour. *Latifondi* farms are very numerous in Sicily. The landlord lets his land to two or more persons jointly, who undertake to restore it to him in good condition with one-third of it "*interrozzito*," that is, fallow, so as to be cultivated the following year according to triennial rotation. These lessees are usually speculators, who divide and sub-let the estate. The sub-tenants in their turn let a part of their land to peasants in *mezzadria*, thus creating a system which is disastrous both for agriculture and the peasants. At harvest-time the produce is placed in the barns of the lessor, who first deducts 25 per cent. as premium, then 16 per cent. for *battiteria* (the difference between corn before and after winnowing), then deducts a proportion for rent and subsidies, so that the portion retained by the actual tiller of the soil is extremely meagre. In bad years the tiller, moreover, gives up seed corn before beginning harvest.

In Sardinia landlord-farming and leasehold prevail. In the few cases of *mezzadria* the Tuscan system is followed.

Industrial Progress.—The industrial progress of Italy has been great since 1880. Many articles formerly imported are now made at home, and some Italian manufactures have begun to compete in foreign markets. The amount of coal consumed in generating steam power for industrial purposes gives an index of this development. In 1887 the amount spent for coal was 116,930,849 lire; in 1891 it was 146,274,447 lire; and in 1898, 178,198,880 lire. The increase in the number of steam motors (including those for industrial and agricultural use, but excluding railway locomotives and steamships) amounted to more than one-third between 1890 and 1898. Thus:—

Year.	Steam Motors.
1890	14,502
1895	18,441
1898	20,472

The application of water power to industry is also growing, especially in the form of water-driven dynamos for the generation of electricity. At the end of 1898 600,000 horse-power are calculated to have been available for motive power.

Another sign of industrial development is to be found in the growing number of manufacturing companies, both Italian and foreign. In less than fifteen years their capital has doubled itself:—

Year.	Industrial Companies.			
	Italian.		Foreign.	
	Number	Paid-up Capital.	Number.	Paid-up Capital.
		Lire.		Lire.
1883	304	644,229,722	79	379,532,858
1890	483	1,310,273,741	121	449,822,351
1897	513	1,253,995,117	147	543,273,409

Particularly worthy of note is the rapid and continuous progress of applied electricity during recent years. During the triennium ending in 1899 the electrical horse-power produced in Italy rose from 50,000 to 100,000, of which about 80,000 was employed in central stations for public services and 20,000 for private use. In 1899 and 1900 the increase was still more rapid. Piedmont and Lombardy are the chief centres of electrical industry.

Mechanical Industries.—The chief development has taken place in mechanical industries, though it has also been marked in metallurgy. Sulphur mining supplies the industries of sulphur-refining and grinding. In 1899, 564,000 tons of raw sulphur, 110,000 tons of refined sulphur, and 162,000 tons of ground sulphur were produced. 698 factories with 6721 workmen are engaged in refining and grinding. Very little pig iron is made, most of the iron ore being exported. In 1883 24,000 tons of pig iron were produced and in 1899 only 19,000. The number of workmen was 296 in 1883 and 308 in 1899. Most of the iron manufactured in Italy consists of old iron resmelted. This branch of industry developed principally between 1883 and 1889, in which latter year 182,000 tons were produced. It subsequently fell off, but of late has again increased, 198,000 tons, worth nearly 55,000,000 lire, having been produced in 1899. Steel-making, for which foreign pig iron is chiefly used, increased from 3630 tons in 1881 to 158,000 in 1899, but diminished, with intermediate oscillations, to 108,000 tons in 1899. The manufacture of steel rails, carried on first at Terni and afterwards at Savona, began in Italy in 1886. The production in 1898 was 21,926 tons. Tin has been manufactured since 1892. Lead, antimony, mercury, and copper are also dealt with, the production of copper and its alloys having been 14,000 tons in 1899.

Whereas in 1880 the various machine workshops belonging to the Government, the railway companies, and private individuals turned out products worth about 70,000,000 lire, the output rose, between 1887 and 1890, to 100,000,000 lire on account of the great development of public works. During the early 'nineties it fell off, but afterwards rose again. Some of these workshops, particularly those of Lombardy and Piedmont, do an export trade.

Textiles.—The textile industries, some of which are of ancient date, are among those that have most rapidly developed. Hand-looms and small spinning establishments have, in the silk industry, given place to large establishments with steam looms.[1] The production of raw silk at least tripled itself between 1875 and 1900. The value of the silks woven in Italy, estimated in 1890 to be 15,000,000 lire, is now, on account of the development of the export trade, calculated to be 100,000,000 lire. Lombardy (especially Como, Milan, and Bergamo), Piedmont, and Venetia are the chief silk-producing regions. The cotton industry has also rapidly developed. The number of spindles, which in 1880 was 900,000, had increased to about 1,900,000 in 1897. Home products not only supply the Italian market in increasing degree, but find their way into foreign markets. While importation of raw cotton increases (272,340 quintals in 1871, 1,308,509 quintals in 1899) importations of cotton thread (85,804 quintals in 1871, 8116 in 1899) and of cotton stuffs (which amounted to 100,921 quintals in 1871) have rapidly decreased. At the same time exports of cotton thread and stuffs have increased, the exact figures being 235 quintals of thread in 1871, 85,596 in 1899; 1613 quintals of woven cotton stuffs in 1871, 123,262 quintals in 1899. In 1897 the number of cotton mills was 376, 80,000 workmen being employed in the industry. The value of the annual produce of the various branches of the cotton industry, which in 1885 was calculated to be 180,000,000 lire, was in 1900, notwithstanding the fall in prices, about 300,000,000 lire. The industry is chiefly developed in Lombardy, Piedmont, and Liguria; to some extent also in Campania, Venetia, and Tuscany, and to a less extent in Lazio (Rome), Apulia, Emilia, the Marches, Umbria, the Abruzzi, and Sicily.

In 1894 the number of woollen mills was 489. The industry gave employment to 30,625 hands, of whom 15,544 were males (2080 under fifteen years) and 15,081 females (1578 under fifteen years). The value of woollen fabrics was about 100,000,000 lire, exclusive of the output of home industry—an increase of some 20,000,000 lire since 1884. As in the case of cotton, Italian

[1] In 1891 the number of mills was 2084, with 1116 steam boilers, 1345 steam and water motors, and 54,588 basins for silk winding. The number of spindles was 1,534,849; that of carding machines 339; looms 14,949, of which 2535 were machine looms. 172,356 workmen were employed in the factories, of whom 154,644 were women (34,258 under fifteen years) and 17,712 men (2328 under fifteen years).

woollen fabrics are conquering the home market in increasing degree. The importation of raw wool increases (95,537 quintals in 1881, 133,982 in 1899), while the importation of spun and woven wool decreases. The industry centres chiefly in Piedmont (province of Novara), Venetia (province of Vicenza), Tuscany (Florence), Lombardy (Brescia), Campania (Caserta), Genoa, Umbria, the Marches, and Rome. To some extent the industry also exists in Emilia, Calabria, Basilicata, the Abruzzi, Sardinia, and Sicily.

The other textile industries (flax, jute, &c.) have made notable progress. The jute industry is concentrated in a few large factories, which from 1887 onwards have more than supplied the home market, and have begun considerably to export.

Chemical industries show an output worth 52,000,000 lire in 1899, as against 26,000,000 in 1893. Between 1893 and 1898 the number of workmen employed rose from 3275 to 5311. The chief products are sulphuric acid (valued at 6,000,000 lire in 1899), sulphate of copper (5,000,000 lire), employed chiefly as a preventive of certain maladies of the vine; carbonate of lead (about 3,000,000 lire), hyperphosphates and chemical manures (21,500,000 lire in 1899, with a total output of 270,000 tons as compared with 72,000 tons in 1893). Pharmaceutical industries, as distinguished from those above mentioned, have kept pace with the general development of Italian activity. The principal product is quinine, the manufacture of which has acquired great importance, notwithstanding the fall in prices. Milan and Genoa are the principal centres. Other industries of a semi-chemical character are candle-, soap-, glue-, and perfume-making, and the preparation of india-rubber. The last named has succeeded, by means of the large establishments at Milan, not only in supplying the whole Italian market, but in doing an export trade. The products of this group of industries are worth approximately 12,000,000 lire.

The *match-making* industry is subject to special fiscal conditions. In 1898–99 there were 312 match factories scattered throughout Italy, but especially in Piedmont, Lombardy, and Venetia. For some years the industry has been almost stationary. In 1898–99 47,379 million matches were made. The number of hands employed was 6400.

The *beetroot-sugar* industry has attained considerable proportions in Umbria, the Marches, Lazio, Venetia, and Piedmont since 1890. In 1899 59,724 quintals were produced. The rise of the industry has been favoured by protective tariffs and by a system of excise which allows a considerable premium to manufacturers.

Alcohol has undergone various oscillations, according to the legislation governing distilleries. In 1871 only 20 hectolitres were produced, but in 1881 the output was 318,000 hectolitres, the maximum hitherto attained. Since then special laws have hampered development, some provinces, as for instance Sardinia, being allowed to manufacture for their own consumption but not for export. In other parts the industry is subjected to an almost prohibitive excise-duty. The average production is about 180,000 hectolitres per annum. The greatest quantity is produced in Lombardy, Piedmont, Venetia, and Tuscany.

Paper-making is highly developed in Italy, and is carried on in the provinces of Novara, Caserta, Milan, Vicenza, Turin, Como, Lucca, Ancona, Genoa, Brescia, Cuneo, Macerata, and Salerno. In 1897 there existed 424 paper mills, giving employment to about 16,000 workmen. The output, which in 1887 was 680,000 quintals, had risen to 1,000,000 quintals in 1897, and has since increased.

Furniture-making in different styles is carried on all over Italy, especially as a result of the establishment of industrial schools. Each region produces a special type, Venetia turning out imitations of 16th and 17th century styles, Tuscany the 15th century or cinquecento style, and the Neapolitan provinces the Pompeian style. Furniture and cabinet-making in great factories are carried on particularly in Lombardy and Piedmont. Bent-wood factories have been established in Venetia and Liguria.

A characteristic Italian industry is that of *straw-plaiting* for hat-making, which is carried on principally in Tuscany, in the district of Fermo, in the Alpine villages of the province of Vicenza, and in some communes of the province of Messina. The plaiting is done by country women, while the hats are made up in factories. Both plaits and hats are largely exported, trade in the former having increased steadily to the level of 23,000 quintals in 1899, and in the latter, though somewhat reduced during recent years, to 37,506 hundreds in 1899.

Ceramics and *glass-working* also show great development, particularly in Tuscany, the Romagna, Venetia, and Naples, and are extending their foreign markets to a considerable degree.

Fisheries.—The number of boats and smacks engaged in the fisheries has remarkably increased. Thus:—

Year.	Boats and Smacks.	
	Number.	Tonnage.
1881 . . .	15,914	49,103
1891 . . .	19,885	54,019
1898 . . .	23,578	68,654
1899 . . .	23,668	69,259

In 1899, 185 boats were engaged in coral fishing, 267 in sponge fishing, and 23,216 in fishing proper. The boats engaged in deep-sea fishing numbered, in 1899, 1608, with a total tonnage of 18,177 and crews numbering 10,012; of these 139 fished for coral, 141 for sponges, and 1328 for fish of various kinds. Most of the fishing boats, properly so called, start from the Adriatic coast, the coral boats from the western Mediterranean coast, and the sponge boats from the western Mediterranean and Sicilian coasts. Fishing and trawling are carried on chiefly off the Italian (especially Ligurian), Austrian, and Tunisian coasts; coral is found principally near Sardinia and Sicily, and sponges almost exclusively off Sicily and Tunis, in the neighbourhood of Sfax.

Fishing proper is steadily increasing; coral fishing, which fell off between 1889 and 1894 on account of the temporary closing of the Sciacca coral reefs by royal decree on 29th December 1888, is again developing. Sponge fishing has notably increased, particularly in 1899. The total value of fish caught in 1899 was estimated to be 12,759,584 lire. Though the fishing industry is extending as regards the number of boats and crews, the value of the aggregate catch tends to diminish. The tunny fisheries in 1899 gave employment to fifty establishments with 3661 workmen, who handled 43,450 quintals of tunny worth 2,564,099 lire. The coral fisheries in the same year produced 350,892 kilogrammes, worth 1,772,970 lire. Sardinian coral commands from 80 to 95 lire per kilogramme, and is much more valuable than the Sicilian coral.

Mines.—The number of Italian mines increased from 589 in 1881 to 1548 in 1899. The number of miners has grown from 45,420 in 1881 to 61,472 in 1899. The output in 1881 was worth about 70,000,000 lire, but by 1895 had decreased to 45,000,000, chiefly on account of the fall in the price of sulphur. But it afterwards rose, and was worth more than 91,000,000 lire in 1899. The chief minerals are sulphur and boracic acid, in the production of which Italy holds one of the first places. Iron, zinc, lead, and, to a smaller extent, copper of an inferior quality, are successfully mined.

Minerals.	Output (in Tons).				Value (in Lire).			
	1881.	1891.	1898.	1899.	1881.	1891.	1898.	1899.
Sulphur . . .	...	...	3,362,841	3,763,206	...	...	40,375,152	44,114,503
Boracic acid . .	2,659	1,775	2,650	2,674	2,127,280	887,500	848,000	855,680
Iron ore . . .	421,065	216,486	190,110	236,549	4,605,933	2,767,187	2,746,239	3,534,117
Zinc . . .	72,176	120,685	132,099	150,629	4,691,843	12,720,605	12,061,667	24,233,330
Lead . . .	39,533	30,233	33,930	31,046	8,184,377	5,984,231	5,221,240	5,610,806
Copper . . .	26,257	53,059	95,128	94,764	1,664,955	2,829,334	2,131,497	3,438,861
Argentiferous ores .	1,444	2,006	435	540	2,238,951	1,973,484	380,238	582,262

The output of stone from quarries is greatly diminished (from 12,500,000 tons, worth 48,000,000 lire, in 1890, to 8,000,000 tons, worth 35,000,000 lire in 1899), a circumstance probably attributable to the slackening of building enterprise in many cities, as well as to the decrease in the demand for stone for railway, maritime, and river embankment works.

Communications.—Between 1881 and 1897 the length of the Italian railway system almost doubled itself; as the following statistics show in detail, the passenger traffic increased by 60 per cent., and the goods traffic by 97 per cent.:—

Year.	Length of lines open to traffic (kilometres).	Passengers. Number.	Passengers. Average length of journey (kilometres).	Goods. Quantity. (Tons).	Goods. Average distance (in kilometres) per ton.	Cattle. No. of Head.	Cattle. No. of Trucks.
1881	8,893	34,040,515	48	10,344,282	124	2,136,905	...
1891	13,393	49,570,716	44	17,153,806	116	961,685	69,452
1895	15,479	52,725,883	44	18,569,138	109	1,133,595	74,344
1897	15,696	54,415,294	44	20,429,709	112	1,159,287	73,755

The development of traffic depends not only upon the opening of new lines, but also upon the industrial and commercial development of the country and upon the general increase of economic activity. The opening of the St Gothard tunnel in 1881 placed Italy in more direct communication with central and northern Europe, and acted as a powerful stimulus to trade. By the law of 27th April 1885, which sanctioned the so-called Railway Conventions, the principal Italian lines, though remaining State property, were farmed out to three private companies known, from the regions through which they chiefly pass, as the "Mediterranean," "Adriatic," and "Sicilian" (*Sicule*). There is, besides, a Sardinian railway system worked by two companies, and several minor private lines on the mainland and in the islands. The State shares the profits of the various lines in different degrees, but assigns a part of its share to the upkeep of the permanent way and of the rolling stock. The State, besides, grants annual kilometric subsidies to certain lines. The cost of the lines, including rolling stock, was calculated to be, on 31st December 1897, 5,106,000,000 lire (£204,240,000), of which 4,765,000,000 lire (£190,600,000) represents the cost of the permanent way and plant, and 341,000,000 lire (£13,640,000) the value of the rolling stock :—

Names of Lines.	Length open to traffic on 31st December 1897 (metres).	No. of Railway Servants. Totals.	No. of Railway Servants. Average per kilometre.	Rolling Stock. Locomotives.	Rolling Stock. Passenger Carriages.	Rolling Stock. Trucks and Vans of all kinds.
Mediterranean.	5,806,751	49,644	8·58	1,322	3,753	24,164
Adriatic . .	5,742,375	39,108	6·91	1,111	3,158	21,210
Sicilian . .	1,083,055	4,566	4·22	156	456	2,107
Secondary lines	3,063,710	7,747	2·53	376	1,218	3,375
Totals .	15,695,891	101,065	6·49	2,965	8,585	50,856

Railway revenue, after deducting working expenses, was, in 1886, 76,852,176 lire (£3,074,087), equal to 7017 lire or, approximately, £280 per kilometre. It rose to 86,353,952 lire in 1899 (7282 lire per kilometre), but in 1897 fell to 81,493,266 lire (5234 lire per kilometre), a diminution chiefly due to the construction of unremunerative lines, the working expenses of which often exceed revenue. The net receipts vary considerably on different lines (6529 lire per kilometre in 1897 for the "Mediterranean," 7044 for the "Adriatic," 1445 for the "Sicilian"), and for some lines, like those of Sardinia, are insufficient to cover expenses. The principal Sardinian line loses 1152 lire per kilometre per annum, and the secondary lines 1570 per kilometre.

Steam and Electric Tramways.—Tramways with mechanical traction have developed rapidly. Between 1878, when the first line was opened, and 1898 the length of the lines grew to exceed 3000 kilometres :—

Length of Mechanical Tramways.

Year.	Kilometres.	Year.	Kilometres.
1878 . .	9	1891 . .	2539
1881 . .	960	1895 . .	2852
1885 . .	2061	1898 . .	3107

These lines exist principally in Lombardy (especially in the province of Milan, which on 31st December 1898 possessed 386 kilometres), in Piedmont, especially in the province of Turin (322 kilometres), and in other regions of northern and central Italy. In the south they are rare, partly on account of the mountainous character of the country and partly from the scarcity of traffic.

Carriage-roads have been greatly extended. On 31st December 1897 there existed 6873 kilometres of State roads, 38,970 of provincial roads, and 54,190 of compulsory communal roads, making a total of 100,033 km., corresponding to 35 km. of road per 100 sq. km. and to 318 km. per 100,000 inhabitants. Accurate statistics are lacking with regard to the optional communal roads and to the rights of way. The ratio of road to area varies in different provinces, Piedmont having 61 km. of road per 100 sq. km., Lombardy 56 km., Venetia 49 km., while other regions are almost roadless, like Sicily, Calabria, Basilicata, and Sardinia. Sardinia has only 16 km. of road per 100 sq. km.

Posts, Telegraphs, and Telephones.—The number of post offices increased from 4823 in 1881 to 6700 in 1891, and to 7707 on 30th June 1898. During the year 1897–98 the Italian post-offices transmitted 547,755,768 letters and post-cards, a total corresponding to an average of 8·41 per inhabitant, as compared with the average of 5·67 in 1887–88. The other services, more directly connected with the development of trade, have also increased. The number of parcels and post-office orders transmitted has kept pace with the growth of general activity, the value of money orders having almost tripled itself between 1875 and 1900. The telegraph system, which in 1881 covered 26,880 kilometres, had extended to 42,005 km. on 30th June 1898. Thirty-seven submarine cables of a total length of 1978 km. unite the various parts of Italy and provide telegraphic communication with neighbouring States. Between 1881 and 30th June 1898, telegrams sent from Italy abroad increased from 540,672 to 1,039,770. Internal telegrams increased less rapidly, 5,495,387 having been sent in 1881 and 7,555,564 in 1897–98. Telephones, first introduced in 1881, have rapidly extended, and on 30th June 1898 59 cities possessed a public telephone service. Inter-provincial telephone lines have been laid, and at the end of 1901 direct telephonic communication was opened between Rome and Paris. From 31st December 1884 to 30th June 1898 private telephone concessions increased in number from 192 to 1005.

Mercantile Marine.—Between the years 1881 and 1899 the number of ships visiting Italian ports for trading purposes decreased slightly (219,598 in 1881, and 211,536 in 1899), while their aggregate tonnage considerably increased (32,070,704 in 1881 and 60,470,392 in 1899), and the quantity of goods unloaded rose from 9,590,933 tons in 1881 to 16,676,751 tons in 1899. The diminution of the number of ships and the increase of their aggregate tonnage is due to the substitution of steam for sailing vessels. The following table illustrates this tendency :—

Year.	General Maritime Traffic. Sailing Vessels. Arrivals and Sailings.	Sailing Vessels. Aggregate Displacement (tons).	Sailing Vessels. Tons of Merchandise (loaded and unloaded).	Steamships. Arrivals and Sailings.	Steamships. Aggregate Displacement (tons).	Steamships. Tons of Merchandise (loaded and unloaded).
1881	169,590	7,078,237	5,059,866	50,008	24,992,467	4,531,067
1891	183,640	7,079,638	4,801,551	67,319	39,820,040	8,855,924
1898	132,911	5,753,085	4,089,058	75,352	53,729,997	11,743,565
1899	135,618	5,869,704	4,325,867	75,918	54,600,688	12,350,884

In the movement of shipping, trade with foreign countries prevails (especially as regards arrivals) over trade between Italian ports. Out of the 11,486,468 tons of merchandise unloaded in Italian ports in 1899, 9,058,529 hailed from abroad and only 2,427,939 from the interior ; out of the 5,190,283 tons embarked, 2,767,336 were sent abroad and 2,422,947 to home ports. Most of the merchandise and passengers bound for and hailing from foreign ports sail under foreign flags. Out of the 9,058,529 tons of merchandise landed in Italian ports from abroad in 1899, only 2,409,157 came in Italian bottoms, and the remaining 6,649,372 in foreign bottoms. Similarly, foreign vessels prevail over Italian

vessels in regard to goods embarked, 1,581,488 tons out of 2,767,336 loaded in 1899 having been carried in foreign bottoms. In the passenger traffic, out of a total of 510,407 passengers landed in Italy, 106,700 landed from Italian and 403,707 from foreign steamers; while 148,547 embarked upon Italian and 387,447 upon foreign steamers. European countries absorb the greater part of Italian sea-borne trade, whereas most of the passenger traffic goes to North and South America.

The substitution of steamships for sailing vessels has brought about a diminution in the number of vessels belonging to the Italian mercantile marine, whether employed in the coasting trade, the fisheries, or in traffic on the high seas. Thus:—

Year.	Total No. of Ships.	Steamships.			Sailing Vessels.	
		Number.	Tonnage (Net).	Horse-power.	Number.	Tonnage (Net).
1881	7,815	176	93,698	?	7,639	895,359
1891	6,617	305	199,945	220,641	6,312	625,812
1898	6,148	384	277,520	303,858	5,764	537,642
1899	6,074	409	314,830	317,942	5,665	558,224

Among the steamers the increase has chiefly taken place in vessels of more than 1000 tons displacement, but the number of large sailing vessels has also increased.

Foreign Trade.—Italian trade with foreign countries (imports and exports) during the quinquennium 1872–76 averaged 2,350,000,000 lire (£94,000,000) a year; in the quinquennium 1893-97 it fell to 2,244,000,000 lire (£88,960,000) a year. In 1898, however, the total rose to 2,617,000,000 lire (£104,680,000), but the increase was principally due to the extra importation of corn in that year. In 1899 it was nearly 3,000,000,000 lire, or £120,000,000. Thus:—

Year.	Trade with Foreign Countries (exclusive of precious metals).			
	Totals.	Imports.	Exports.	Excess of Imports over Exports.
1881	2,405,187,767	1,239,671,520	1,165,516,247	74,155,273
1891	2,003,384,738	1,126,584,583	876,800,155	249,784,428
1898	2,616,904,650	1,413,335,346	1,203,569,304	209,766,042
1899	2,937,977,586	1,506,561,188	1,431,416,398	75,144,790

The recent general depreciation of agricultural and industrial produce must, however, be taken into account, and the same money value probably represents an increased quantity of merchandise. Supposing the prices of 1884 to have been constant, the returns for 1898 would show an increase of 392,000 lire in exports and 270,000,000 lire in imports. From 1882 to 1887 imports steadily increased from 1,227,000,000 lire to 1,605,000,000 lire. In 1888, after the tariff reform of 1887, they fell considerably, and in 1894 were only 1,095,000,000 lire. During recent years the tendency has been towards a slight increase of imports.

The countries with which Italy carried on most active import trade in 1899 were:—

	Lire.		Lire.
Great Britain	299,537,000	Russia	96,157,000
Germany	193,964,000	British India	73,999,000
United States	168,449,000	China	68,754,000
Austria-Hungary	160,848,000	Switzerland	49,337,000
France	152,330,000	Rumania	27,299,000

With regard to exports alone, fully one-half of the total amount is absorbed by the markets of Switzerland (246,618,000 lire), Germany (236,107,000 lire), France (201,293,000 lire), and Austria-Hungary (158,698,000 lire). The remainder, worth about 500,000,000 lire, is distributed between Great Britain (147,958,000 lire), the United States (118,115,000 lire), and the Argentine Republic (60,574,000 lire). Switzerland has therefore been the chief customer of Italy since the rupture of Italian commercial relations with France, which prior to 1888 absorbed some 375,000,000 lire of Italian products. Now, in spite of the Franco-Italian commercial treaty of 1898, France only buys some 200,000,000 lire per annum. The other countries which absorb Italian products are, in order of importance, as follows:—

	Lire.		Lire.
British India	28,420,000	Uruguay	7,781,000
Egypt	27,719,000	Chile	4,872,000
Belgium	24,424,000	Sweden and Norway	3,654,000
Holland	19,194,000	Denmark	1,567,000
Spain	14,105,000	Mexico	704,000
Russia	13,720,000	Bulgaria	275,000
Greece	8,317,000		

The most important imports are minerals, including coal and metals (both in pig and wrought); silks, raw, spun, and woven; stone, potter's earths, earthenware, and glass; corn, flour, and farinaceous products; cotton, raw, spun, and woven; and live stock. The principal exports are silk in all its forms, live stock, wines, spirits, and oils; corn, flour, maccaroni, and similar products; and minerals, chiefly sulphur. The raw materials for manufacture represent about 60 per cent. of the imports and more than 50 per cent. of the exports.

Prior to the tariff reform of 1887 manufactured articles, alimentary products, and raw materials for manufacture held the principal places in the imports. In the exports, alimentary products came first, while raw materials for manufacture and manufactured articles were of little account. After 1888 the importation of alimentary products and manufactured articles fell off, while that of raw and semi-raw materials for manufacture increased. Exports, which fell off during the years 1888 and 1890, on account of the economic crisis, have more than recovered their position. The transformation of Italy from a purely agricultural into a largely industrial country is shown by the circumstance that trade in raw stuffs, semi-manufactured and manufactured materials, now preponderates over that in alimentary products and wholly-manufactured articles. The balance of Italian trade has undergone frequent fluctuations. The large predominance of imports over exports after 1884 was a result of the falling off of the export trade in live stock, olive oil, and wine, on account of the closing of the French market, while the importation of corn from Russia and the Balkan States increased considerably. In 1894 the excess of imports over exports fell to 68,000,000 lire, but by 1898 it had grown to 210,000,000 lire, in consequence chiefly of the increased importation of coal, raw cotton and cotton thread, pig and cast iron, old iron, grease, and oil-seeds for use in Italian industries. In 1899, however, the excess of imports over exports fell to 75,000,000 lire.

Currency.—The total amount of money coined in Italy (exclusive of Eritrean currency) from 1st January 1862 to the end of 1899, was 1,100,114,269·54 lire, thus divided: gold, 427,099,650 lire; silver at $^{900}/_{1000}$, 364,637,025 lire; silver at $^{835}/_{1000}$ 204,698,544 lire; nickel, 20,000,000 lire; copper, 83,679,050·54. During the same period coins to a nominal value of 731,676,238 lire were withdrawn from circulation in the following proportions: gold, 41,072,935; silver, 662,262,759; copper, 28,340,544. The forced paper currency, instituted by the decree of 1st May 1866, was abolished by the law of 7th April 1881, which also dissolved the Union of Banks of Issue created in 1874 to furnish to the State treasury a milliard of lire in notes, guaranteed collectively by the banks. The amount of notes actually furnished to the State was, however, only 940,000,000 lire. The law of 7th April 1881 enacted that all the notes of the Bank Union circulating on 1st July of that year should pass to the charge of the State treasury, and that 600,000,000 of the 940,000,000 lire of notes furnished to the State should be gradually redeemed with the proceeds of a loan which the Minister of the Treasury was authorized to contract for the sum of 644,000,000

lire. The remaining 340,000,000 lire of Union notes were to be replaced by 240,000,000 of ten-lire and 100,000,000 of five-lire State notes, such State notes to be payable at sight in metallic legal tender by certain State banks. Nevertheless the law of 1881 did not succeed in maintaining the value of the State notes at a par with the metallic currency, and from 1885 onwards there reappeared a gold premium, which during 1899 and 1900 remained at about 7 per cent., but which has since fallen to about 3 per cent. The paper circulation to the debit of the State on 31st December 1899 consisted of 451,431,780 lire in State notes, 42,138,152 in *bons de caisse*, making in all a total of 493,569,932 lire. At the same time the paper currency issued by the authorized State banks amounted to 1,180,110,330 lire, thus:—

Date.	Paper Currency.

The metallic reserve of the Treasury on 31st December 1899 (exclusive of copper and nickel) was 122,037,827 lire, consisting of 30,565,434 lire in gold and 91,472,393 lire in silver, 6,036,595 of the latter being in five-franc pieces. At the same date the Treasury possessed 1,219,391 lire of nickel coins and 4,320,291 lire of copper coins. The metallic reserve of the State banks was altogether 541,125,623 lire, of which 488,043,793 was in gold or in securities equal to gold (foreign gold bills, foreign bank notes, foreign treasury bills, and credits in foreign current accounts), and 53,081,830 in silver.

Banks.—Prior to the year 1893 the juridical status of the Banks of Issue was regulated by the laws of 30th April 1874 on paper currency and of 7th April 1881 on the abolition of forced currency. At that time four limited companies were authorized to issue bank notes, namely, the National Bank, the National Bank of Tuscany, the Roman Bank, and the Tuscan Credit Bank; and two banking corporations, the Bank of Naples and the Bank of Sicily. In 1893 the Roman Bank was put into liquidation, and the other three limited companies were fused, so as to create the Bank of Italy, the privilege of issuing bank notes being thenceforward confined to the Bank of Italy, the Bank of Naples, and the Bank of Sicily. By the law of 10th August 1893 a new bank statute was instituted, but was modified subsequently by the laws of 1894, 1895, 1897, and 1898. The paid-up capital of the Bank of Italy, and of the two southern banks available for currency purposes, is 287,000,000 lire, thus divided: Bank of Italy, 210,000,000 lire; Bank of Naples, 65,000,000 lire; and Bank of Sicily, 12,000,000 lire. The following table gives an analysis of the condition of these banks on 31st December 1899:—

Banks of Issue.	Bank Notes in Circulation.	Metallic Reserve.	Securities, Bills, and Advances.
Bank of Italy .	881,813,128	422,258,152	407,273,365
Bank of Naples .	236,585,511	118,486,888	87,412,102
Bank of Sicily .	61,711,691	40,799,282	43,761,857
Totals .	1,180,110,330	581,544,322	538,447,324

The discount operations effected by the banks of issue increased from 2,273,706,411 lire in 1881 to 2,807,015,942 lire in 1899; and advances on current account from 269,735,002 in 1881 to 347,656,418 lire in 1899.

The price of Italian consolidated 5 per cent. stock, which is the security most largely negotiated abroad, and used in settling differences between large financial institutions, has steadily risen during recent years. After being depressed between 1885 and 1894, the prices in Italy and abroad reached, in 1899, on the Rome Stock Exchange, the average of 100·83, and of 94·8 on the Paris Bourse. By the end of 1901 the price of Italian stock on the Paris Bourse had, however, risen to par or thereabouts. Rates of exchange, or, in other words, the gold premium, favoured Italy during the years immediately following the abolition of the forced currency in 1881. In 1885, however, rates tended to rise, and though they fell in 1886, they subsequently increased to such an extent as to reach 110 per cent. at the end of August 1894. For the next four years they continued low, but rose again in 1898 and 1899. In 1900 the maximum rate was 107·32, and the minimum 105·40, but in 1901 rates fell considerably.

There are in Italy six Clearing Houses, namely, the ancient one at Leghorn, and those of Genoa, Milan, Rome, Florence, and Turin, founded since 1882. The total amount cleared in 1899 was nearly 36 milliards of lire, of which 28½ milliards were cleared by compensation. The difference of 7349 million lire was settled, partly by credits in current account (4738 million lire), and partly (2611 million lire) by money payments. Stock exchange transactions represented 9½ out of the total clearings of 36 milliards of lire. The amount cleared, which decreased considerably in 1890, 1891, and in 1894–95, has again increased, especially in 1898–99:—

Clearing House Operations.	
Year.	Lire.
1891 . .	13,423,249,649
1895 . .	15,379,192,320
1899 . .	35,869,587,721

The number of ordinary banks, which diminished between 1889 and 1894, increased again in the following years, and was 158 in 1898. At the same time the capital employed in banking decreased by nearly one-half, namely, from 309 millions in 1880 to 163 millions in 1898. This decrease was due to the liquidation of a number of large and small banks, amongst others the Bank of Genoa, the General Bank, and the Società di Credito Mobiliare Italiano of Rome, and the Genoa Discount Bank—establishments which alone represented 121 millions of paid-up capital. Ordinary credit operations are also carried on by the co-operative credit societies, of which there were 696 in 1898, with a capital of 103,736,000 lire.

Agrarian Credit Banks.—The banks which make a special business of lending money to owners of land or buildings (*credito fondiario*) are regulated by the laws of 17th July 1890, 6th May 1891, 10th August 1893, and 8th August 1895. Loans are repayable by instalments, and are guaranteed by first mortgages not greater in amount than half the value of the hypothecated property. The banks may, moreover, buy up mortgages and advance money on current account on the security of land or buildings. The development of building enterprise in the large cities has induced these land and mortgage banks to turn their attention rather to building enterprise than to mortgages on rural property. The transactions of these institutions have notably increased: the value of their land certificates or *cartelle fondiarie* (representing capital in circulation) rose from 263 millions in 1881 to 389 millions in 1886, and to 768 millions in 1891, but fell to 733 millions in 1896 and to 684 millions in 1898; the amount of money lent increased from 261 millions in 1881 to 390 millions in 1886, and 770 millions in 1891, but fell to 733 millions in 1896 and 684 millions in

1899. The diminution was due to the law of 10th April 1893 upon the banks of issue, by which they were obliged to liquidate the loan and mortgage business which they had previously carried on.

In view of the importance of agriculture in Italy, various laws have been passed to facilitate agrarian credit. The law of 23rd January 1887 (still in force) extended the dispositions of the Civil Code with regard to "privileges,"[1] and established special "privileges" in regard to harvested produce, produce stored in barns and farm buildings, and in regard to agricultural implements. Loans on mortgage may also be granted to land-owners and agricultural unions, with a view to the introduction of agricultural improvements. These loans are regulated by special disposition, and are guaranteed by a share of the increased value of the land after the improvements have been carried out. Agrarian credit banks may, with the permission of the Government, issue *cartelle agrarie*, or agrarian bonds, repayable by instalments and bearing interest. On 31st December 1898 only five agrarian banks proper were in existence, but the Monte dei Paschi of Siena and the Bologna Savings Bank have special sections for agrarian credit. The paid-up capital of these seven institutions was at that date 3,274,921 lire. The value of the agrarian bonds in circulation was 1,403,000, the discount operations 13,942,422 lire, and the sums advanced on current account, 1,006,419 lire.

Condition of the Working Classes.—The condition of the numerous agricultural labourers (who constitute one-third of the population) is, except in some regions, hard, and in places absolutely miserable. Much light was thrown upon their position by the agricultural inquiry (*inchiesta agraria*) completed in 1884. The large numbers of emigrants, who are drawn chiefly from the rural classes, furnish another proof of poverty. The terms of agrarian contracts and leases (except in districts where *mezzadria* prevails in its essential form), are in many regions disadvantageous to the labourers, who suffer from the obligation to provide guarantees for payment of rent, for repayment of seed corn, and for the division of products.

Examining in detail the position of the rural classes in Lombardy and Venetia, there exist—in addition to the factor, who superintends work and has a comfortable position, with 1200 to 1800 lire (£48 to £72) per annum, plus a share in the profits—the *casaro*, who conducts the industry of cheese-making, and receives in return from £4 to £8 a year in money, an allotment to cultivate for himself, and a certain proportion of wine, oil, and milk, earning altogether between £24 and £28 a year; the *bifolco*, who has charge of the draught cattle and horses, and receives a cottage, firewood, and an allotment, earning altogether about £20 a year; the *cavallaro* and *vaccaro*, who tend the horses and cows, and receive the same treatment as the *bifolco;* and the day labourers, who earn from 5d. to 8d. a day, plus an additional percentage at seed time, hoeing time, harvest, and threshing. Chance labourers are better paid (10d. a day in winter, 1s. 3d. a day in summer), but suffer from lack of regular employment. In Venetia the lives of the small proprietors and of the salaried peasants are often extremely miserable. There and in Lombardy the disease known as *pellagra* is most widely diffused. According to recent investigations, the disease is not due to the insufficient alimentary power of cereals, but to poisoning by micro-organisms produced by deteriorated maize, and can be combated successfully by care in ripening, drying, and storing the maize. The most recent statistics show the disease to be diminishing. Whereas in 1881 there were 104,067 (16·29 per 1000) peasants afflicted by the disease, in 1899 there were only 72,603 (10·30 per 1000) peasants, with a maximum of 39,882 (34·32 per 1000) peasants in Venetia, and 19,557 (12·90 per 1000) peasants in Lombardy. The decrease of the disease is a direct result of the efforts made to combat it, in the form of special hospitals or *pellagrosari*, economic kitchens, rural bakeries, and maize-drying establishments. A Bill for the better prevention of pellagra was introduced by the Zanardelli Cabinet in the spring of 1902.

In Liguria, on account of the comparative rarity of large estates, agricultural labourers are in a better condition. Men earn between 1s. 3d. and 2s. 1d. a day, and women from 5d. to 8d. In Emilia, the day labourers, known as *disobbligati*, earn, on the contrary, low wages, out of which they have to provide for shelter and to lay by something against unemployment. Their condition is miserable. In Tuscany, however, the prevalence of *mezzadria*, properly so called, has raised the labourers' position. Yet in some Tuscan provinces, as, for instance, that of Grosseto, where malaria rages, labourers are organized in gangs under "corporals," who undertake harvest work. They are poverty-stricken, and easily fall victims to fever. In the Abruzzi and in Apulia both regular and irregular workmen are engaged by the year. The *curatari* or *curatoli* (factors) receive £40 a year, with a slight interest in the profits; the stockmen hardly earn in money and kind £13; the muleteers and underworkmen get between £5 to £8, plus firewood, bread, and oil; irregular workmen have even lower wages, with a daily distribution of bread, salt, and oil. In Campania and Calabria the *curatoli* and *massari* earn, in money and kind, about £12 a year; cowmen, shepherds, and muleteers about £10; irregular workmen are paid from 8½d. to 1s. 8d. per day, but only find employment, on an average, 230 days in the year. The condition of Sicilian labourers is also miserable. The huge extent of the *latifondi*, or large estates, often results in their being left in the hands of speculators, who exploit both workmen and farmers with such usury that the latter are often compelled, at the end of a scanty year, to hand over their crops to the usurers before harvest. In Sardinia wage-earners are paid 10d. a day, with free shelter and an allotment for private cultivation. Irregular adult workmen earn between 10d. and 1s. 3d., and boys from 6d. to 10d. a day. Woodcutters and vine-waterers, however, sometimes earn as much as 3s. a day.

The condition of the workmen employed in the various branches of manufacturing industry has improved during recent years. Wages are higher, the cost of the prime necessaries of life is, as a rule, lower, so that an improvement, not merely nominal, but real, has taken place in the remuneration of work. Taking into account the variations in wages and in the price of wheat, it may be calculated that the number of hours of work requisite to earn a sum equal to the price of 100 kilogrammes of wheat fell from 183 in 1871 to 76 in 1894. In 1898 it was 105, on account of the rise in the price of wheat, which averaged 27 lire per quintal in bond, while in 1894 it was only 19 lire per quintal. Wages, however, have not risen in all industries. In the mining and woollen industries they have fallen, but have increased in mechanical, chemical, silk, and cotton industries. Wages vary greatly in different parts of Italy, according to the cost of the necessaries of life, the degree of development of working-class needs, and the state of working-class organization, which in some places has succeeded in increasing the rates of pay. Women are, as a rule, paid less than men, and though their wages have also increased, the rise has been slighter than in the case of men. In some trades, for instance, the silk trade, women earn little more than 10d. a day, and, for some classes of work, as little as 7d. and 4½d.

Strikes.—The number of industrial strikes has risen from year to year, although, on account of the large number of persons involved in some of them, the number of strikers has not always corresponded to the number of strikes. Accurate statistics are only forthcoming up to the end of 1899. During the years 1900 and 1901, however, strikes were increasingly numerous, chiefly on account of the growth of Socialist and working-class organizations. During 1901 the strikes numbered nearly 1500, and involved a considerable proportion (approximately 1,000,000) of the industrial and agricultural population of northern and central Italy. The following table indicates the increase during the two decades 1879–99:—

Year.	Number of Strikes.	Number of Strikers.
1879 . . .	32	4,011
1890 . . .	139	38,402
1895 . . .	126	19,307
1897 . . .	217	76,570
1898 . . .	256	35,705
1899 . . .	259	43,194

The greatest proportion of strikes takes place in northern Italy, especially Lombardy and Piedmont, where manufacturing industries are most developed. In 1897, however, a strike, involving 41,550 persons, took place among the Tuscan straw-plaiters (women). The smallest proportion occurs in the south, especially in Calabria, Apulia, and Sardinia. In 1896 strikes were numerous among the Sicilian sulphur-miners. Textile, building, and mining industries show the highest percentage of strikes, since they give employment

[1] "Privileges" assure to creditors priority of claim in case of foreclosure for debt or mortgage. Prior to the law of 23rd January 1887 harvested produce and agricultural implements were legally exempt from "privilege."

to large numbers of men concentrated in single localities. The strikes of day-labourers or *braccianti* who work in gangs upon railway embankments, railway cuttings, excavations, and similar undertakings are, however, frequent in central Italy, particularly in Romagna, but their number varies little from year to year. Printers, lithographers, carpenters, and hat-makers strike less than other trades. It may be noted that printers and hat-makers possess the oldest and soundest trade organizations. The days of work lost through strikes were in 1897 1,113,535, in 1898 239,292, and in 1899 231,590. The chief motives are demands for an increase of pay (44 per cent. in 1899), opposition to a decrease of pay (11 per cent. in 1899), attempts to obtain shorter hours of work (7 per cent. in 1899), and resistance to increased hours of work (2 per cent.). Of late a tendency has become apparent to demand simultaneously an increase of wages and reduction of the hours of work. Fifty-eight per cent. of the strikes in 1899 ended in favour of the workmen—31 per cent. wholly and 27 per cent. partially; 42 per cent. gave a purely negative result. Agricultural strikes, though less frequent than those in manufacturing industries, have special importance in Italy. They were exceptionally numerous in the years 1885, 1886, 1897, and 1898, but in the spring and summer of 1901 they were more numerous than ever before. Instead of occurring most frequently in the purely agricultural districts of the south, they are most common in the north and centre, a circumstance which shows them to be promoted less by the more backward and more ignorant peasants than by the better-educated labourers of Lombardy and Emilia, among whom Socialist organizations are widespread.

Although in some industrial centres the working-class movement has assumed an importance equal to that of other countries, there is a complete lack of any general working-class organization comparable to the English trade unions. Mutual benefit and co-operative societies often serve the purpose of working-class defence or offence against the employers, but it is difficult to ascertain the exact number of associations designed to protect the interest of workmen. Roughly speaking, they may be divided into two groups, Mazzinians and Socialists, the former of which makes little progress, while the latter is rapidly gaining ground. In 1893, after many vicissitudes, the Italian Socialist Labour Party was founded, and has now become the Italian Socialist Party, in which the majority of Italian workmen tend increasingly to enrol themselves. Printers and hat-makers, however, possess trade societies, that of the former being known as the *Federazione Italiana dei lavoratori del libro*. In 1899 an agitation began for the organization of "Chambers of Labour," intended to look after the technical education of workmen and to form commissions of arbitration in case of strikes. They act also as employment bureaux, and are often centres of political propaganda. At present such "chambers" exist in many Italian cities, while "leagues of improvement," or of "resistance," are rapidly spreading in the country districts. In many cases the action of these organizations has proved, at least temporarily, advantageous to the working classes.

Labour legislation is backward in Italy, on account of the late development of manufacturing industry and of working-class organization. A law dated 26th February 1886, on child labour, forbids—(*a*) the employment of children under nine years of age in factories, quarries, and mines, or under ten years if work is carried on underground; (*b*) the employment of children under fifteen years of age, unless furnished with medical certificates of physical fitness; (*c*) limiting the working day to eight hours for children between nine and twelve years of age; (*d*) forbidding employment of children under fifteen in dangerous or unhealthy trades. This law has not been strictly applied. On 17th April 1898 a species of Employers' Liability Act compelled employers of more than five workmen to insure their employees against accidents. The law applies to quarries, mines, building trades, shipyards, naval arsenals, railways and factories, and embraces between 1,700,000 and 2,000,000 workmen.[1] On 17th July 1898 a national fund for the insurance of workmen against illness and old age was founded by law on the principle of optional registration. In addition to an initial endowment by the State, part of the annual income of the fund is furnished in various forms by the State (principally by making over a proportion of the profits of the Post Office Savings Bank), and part by the premiums of the workmen. The minimum annual premium is six lire for an annuity of one lira per day at the age of sixty, and insurance against sickness. At present fewer than 20,000 workmen are inscribed. The low level of wages in many trades and the jealousies of the "Chambers of Labour" and other working-class organizations impede rapid development.

The French institution of *Prudhommes* was introduced into Italy in 1893, under the name of *Collegi di Probiviri*. Hitherto the institution has not attained great vogue, the number of colleges being only eighty-six. Milan has eleven, Rome six, Florence six, Turin five, and Bologna four; but many large cities have none. Most of the colleges deal with matters affecting textile and mechanical industries. Each "college" is founded by royal decree, and consists of a president, with not fewer than ten and not more than twenty members. A conciliation bureau and a jury are elected to deal with disputes concerning wages, hours of work, labour contracts, &c., and have power to settle the disputes, without appeal, whenever the amounts involved do not exceed £8.

Provident Institutions.—Provident institutions have considerably developed in Italy under the forms of savings banks, assurance companies, and mutual benefit societies. Besides the Post Office Savings Bank and the ordinary savings banks (the former regulated by the law of 27th March 1875, and the latter by the laws of 15th July 1888, and 17th July 1898), many co-operative credit societies and ordinary credit banks receive deposits of savings. Altogether these institutions now number 6226, namely, 404 ordinary savings banks, 680 co-operative credit societies, 113 ordinary credit banks,[2] and 5029 branches of the Post Office Savings Bank. The total number of savings bank books issued was 5,693,856, representing an aggregate deposit of 2,358,674,649 lire. These totals were split up as follows:—

	Savings Bank Books.	Sums Deposited.
Ordinary Savings Banks .	1,630,678	1,430,816,003
Co-operative Credit Societies .	297,990	233,841,979
Ordinary Credit Banks . .	100,570	66,016,667
Post Office Savings Bank .	3,664,618	628,000,000

The greatest increase has taken place in the deposits of the Post Office Savings Bank. In 1899 the number of books issued was nearly eight times and that of the deposits nearly ten times as much as in the year 1881. The books issued by the ordinary savings banks increased during the same period by nearly two-thirds, while the deposits doubled themselves.

Year.	Ordinary Savings Banks.			Co-operative and Ordinary Credit Societies used as Savings Banks.			Post Office Savings Bank.		
	No. of Banks.	No. of Books issued to Depositors.	Aggregate Deposits.	No. of Banks.	No. of Books issued to Depositors.	Aggregate Deposits.	No. of Branch Offices.	No. of Books issued to Depositors.	Aggregate Deposits.
1881 . .	355	997,026	714,805,451	249	205,488	197,586,249	3406	471,094	66,996,865
1890 . .	392	1,397,301	1,166,385,847	749	424,304	315,501,265	4479	2,126,289	310,483,635
1895 . .	402	1,588,424	1,343,720,018	793	374,294	266,053,032	4777	2,938,402	462,413,311
1899 . .	404	1,630,678	1,430,816,003	...	...	...	5029	3,664,618	628,000,000

The greatest number of savings banks exists in Lombardy; Piedmont and Venetia come next. Campania holds the first place in the south, most of the savings of that region being deposited in the provident institutions of Naples. In Liguria and Sardinia the habit of thrift is less developed.

Assurance societies in Italy are subject to the general dispositions of the commercial code regarding commercial companies. At the end of 1898 there were 158 assurance companies, of which 102 were Italian and 56 foreign. Thirty-eight carried on the business of life assurance, 58 that of fire insurance, 37 that of insurance of goods and persons during transport, 19 insurance against hail, 12 insurance against accidents, and 16 other forms of insurance.

Mutual benefit societies have increased rapidly, both because

[1] It has been proposed to extend this law to seamen, fishermen, navvies, workmen employed in fixing or repairing lightning conductors, drivers of traction engines and steam ploughs or reapers, &c.

[2] The data with regard to the co-operative credit societies refer to the year 1898, and those relating to the ordinary credit banks to the year 1895.

their advantages have been readily appreciated, and because, until recently, the State had taken no steps directly to insure workmen against illness. The present Italian mutual benefit societies strongly resemble the ancient beneficent corporations and institutions, of which in some respects they may be considered a continuation. The societies require Government recognition if they wish to enjoy legal rights. The State (law of 15th April 1896) imposed this condition in order to determine exactly the aims of the societies, and, while allowing them to give help to their sick, old, or feeble members, or aid the families of deceased members, to forbid them to pay old-age pensions, lest they assumed burdens beyond their financial strength. Nevertheless, the majority of societies have not sought recognition. The total number of societies, recognized and unrecognized, which was 2091 in 1878, had risen to 6725 in 1895, but the number of members is not known in all cases. In 1895 returns were made by 6587 societies, which possessed an aggregate membership of 994,183. For recognized societies more recent figures are obtainable. On 31st December 1897 they numbered 1166, with an aggregate membership of 187,657 and an aggregate capital of more than 18,000,000 lire.

Co-operation.—Co-operation, for the various purposes of credit, distribution, production, and labour, has attained great development in Italy. Some of the societies have complied with the dispositions of the commercial code, and possess a corporate juridical personality; others simply exist without juridical status. Credit co-operation is represented by a special type of association known as People's Banks (*Banche Popolari*), which have gradually spread throughout Italy. In 1881 they numbered 171, and in 1898 had increased to 696; with an increase of capital from 53,386,000 lire in 1881 to 103,736,000 lire in 1898, and of membership from 105,177 to 381,445.[1] People's banks, however, are not, as a rule, supported by workmen or peasants, but rather by small tradespeople, manufacturers, and farmers, who in 1898 made up 50 per cent. of their members, while workmen represented only 9 per cent., and peasants 4 per cent. A recent form of co-operative credit banks are the *Casse Rurali*, or rural banks, on the Raffeisen system, which lend money to peasants and small proprietors out of capital obtained on credit or by gift. These loans are made on personal security, but the members of the bank do not contribute any quota of the capital, though their liability is unlimited in case of loss. The first rural bank was founded in 1882. At present they number 904, and both their membership and the amount of business done have largely increased. They are especially widespread in Lombardy and Venetia, in part of which regions the Clerical party has, for purposes of political propaganda, worked to extend their sphere of action and to multiply their number.

Among co-operative societies those engaged in distribution are most numerous, having increased from 18 with a paid-up capital of 420,000 lire (£16,800) in 1883 to 508 with a paid-up capital of more than 4,500,000 lire (£180,000) in 1898. These, however, are all recognized by the State, and consequently possess juridical status. The unrecognized societies numbered about 700 in 1895. Distributive co-operation is confined almost entirely to Piedmont, Liguria, Lombardy, Venetia, Emilia, and Tuscany, and is practically unknown in Basilicata, the Abruzzi, and Sardinia. Most of the societies exist in thickly-populated centres, where the cost of commodities tends to increase. As in the case of the people's banks, many of them are supported rather by civil servants and officers than by working men proper, and even those supported by workmen differ from the English type of society in that they, as a rule, sell at cost price instead of selling at current prices so as to be able to distribute dividends at the end of the year.

In spite of the difficulties everywhere experienced in productive co-operation, Italian societies of production have attained considerable importance. Day labourers and bricklayers have succeeded in organizing themselves into societies requiring little capital and undertaking various public works. They contract directly for the work to be done, and distribute it between gangs of their members, who are paid at a fixed rate. They supply the necessary tools to the workmen who have none, and at the end of the contract divide the profits between members in proportion to the work done by each. The most important of these societies is that of the *braccianti* or labourers of Ravenna; though at the end of 1894, the latest date for which statistics have been collected, there existed 522 productive co-operative societies of this kind, which during the year had executed 126 contracts for an aggregate of 1,469,485 lire (£58,800). Co-operative house-building is also on the increase, and is supported not only by workmen, but also by persons of other classes in search of remunerative investments.

Education.—The number of persons unable to read and write has gradually decreased, both absolutely and in proportion to the number of inhabitants. The census of 1871 gave 73 per cent. of illiterate, that of 1881 67 per cent., while the proportion of illiterates to the population above six years of age diminished from 69 to 62 per cent. It may be calculated that at present less than one-third of the adult males and about one-half of the adult females are unable to read or write. The ratio of illiterates varies according to provinces, the north, especially the provinces of Turin, Sondrio, and Como, giving the lowest, and the south, especially Sicily (province of Girgenti) and Calabria, the highest percentages. As might be expected, progress has been most rapid wherever education, at the moment of national unification, was most widely diffused. For instance, the number of bridegrooms unable to write their names in 1872 was in the province of Turin 26 per cent., and in the Calabrian province of Cosenza 90 per cent.; in 1899 the percentage in the province of Turin had fallen to 5 per cent., while in that of Cosenza it was still 76 per cent. The decrease of illiteracy is a direct consequence of the increase of primary popular education. Infant asylums (where the first rudiments of instruction are imparted to children between two and a half and six years of age) and elementary schools have increased in number. There has been a corresponding increase in the number of scholars. Thus:—

Year.	Infant Asylums (Public and Private).		Daily Elementary Schools (Public and Private).	
	Number of Asylums.	Number of Scholars.	Number of Schoolrooms.	Number of Scholars.
1885–86	2083	240,365	53,628	2,252,898
1890–91	2296	278,204	57,077	2,418,692
1897–98	2989	324,751	57,384	2,531,744
1898–99	3205	346,837	60,483	2,636,957

The rate of increase in the public State-supported schools (1,873,723 scholars in 1882–83 and 2,444,288 in 1898–99) has been much greater than in the private schools (163,102 in 1882–83 and 192,669 in 1898–99). School buildings have been improved and the qualifications of teachers raised. Nevertheless, many schools are still defective, both from a hygienic and a teaching point of view; while the economic position of the elementary teachers, who in Italy depend upon the communal administrations and not upon the State, is still in many parts of the country extremely low. The law of 1877 rendering education compulsory for children between six and nine years of age has been the principal cause of the spread of elementary education. The law has been gradually applied in the various communes, but is still imperfectly enforced. At the end of 1898–99 only 66 per cent. out of the whole number of children between six and nine years of age were registered in the lower standards of the elementary and private schools. The evening schools, established for the benefit of those who have only been able to attend the lowest standards of the elementary schools, have to some extent helped to spread education. Their number and that of their scholars have, however, decreased since the withdrawal of State subsidies. In 1895–96 they numbered 4245, with 138,181 scholars. Regimental schools impart elementary education to illiterate soldiers. Whereas the levy of 1894 showed 40 per cent. of the recruits to be completely illiterate, only 27 per cent. were illiterate when the levy was discharged in 1897. Private institutions and working-class associations have for some years striven to improve the intellectual conditions of the working classes. Popular universities have lately attained considerable development in the principal Italian cities. The number of institutes devoted to secondary education remained almost unchanged between 1880–81 and 1895–96. In some places the number has even been diminished by the suppression of private educational institutes.

[1] These figures refer only to the 124 banks which made returns in 1881 and to the 594 which made returns in 1898.

On the other hand, the number of scholars has considerably increased, and shows a ratio superior to the general increase of the population. The greatest increase has taken place in technical education, where it has been much more rapid than in classical education. This is a result of the industrial and commercial development of the country. There are three higher commercial schools, with academic rank, at Venice, Genoa, and Bari, and eleven secondary commercial schools; and the technical and commercial schools for women at Florence and Milan should also be mentioned. The number of agricultural schools has also grown, although the total is relatively small when compared with population. The number of university students has almost doubled, having grown from 11,368 in 1881–82 to 22,257 in 1897–98, exclusive of the students attending university lectures in the lyceums and in the schools of superior studies. The faculties attended by the largest number of students are those of medicine and surgery (6374), law (6315), while those of physical and natural sciences counted 2269, and of letters and philosophy 1351. The schools of practical engineering were in 1898–99 attended by 1218 students. On the whole, the increase has been more rapid in the philosophical and scientific faculties than in those of jurisprudence and medicine. The most frequented State universities are those of Naples, Turin, Rome, Padua, Pavia, and Bologna; and of the free universities, Perugia and Camerino come first.

The number of students in the schools of fine art and in the State musical conservatories has remained almost stationary:—

Year.	Fine Art Students.	Music Students.
1888–89 . . .	1971	794
1897–98 . . .	2198	875

Libraries are numerous in Italy, those even of small cities being often rich in manuscripts and valuable works. Statistics, collected in 1893–94 and 1896, revealed the existence of 1831 libraries, either private (but open to the public) or completely public. Forty-two belonged to the State, 418 to the communal or provincial authorities, 378 were attached to institutes for primary or secondary education, 45 were military, 46 were attached to archives or State departments, 172 to academies, scientific institutes, or chambers of commerce, 478 belonged to mutual benefit societies and circulating libraries, 175 were archiepiscopal, parochial, or seminarist, 35 belonged to other institutes, and 40 to private individuals. There are no statistics of the works read or of the readers, except as regards the State libraries. In 1872 these libraries were visited by 853,900 persons, to whom 1,218,887 books or manuscripts were distributed; in 1898 the number of visitors had grown to 1,294,869, and that of the works and manuscripts read to 1,690,825. The increasing number of books and periodicals printed every year in Italy is a further sign of the improvement in general culture. In 1871 newspapers and reviews numbered 765; in 1895 they numbered 1901, a total equal to 1 per 16,361, as against 1 per 35,034 inhabitants in 1871. Of these periodicals 128 were daily newspapers, 613 weekly, and 458 monthly publications; 566 were political in character, including 87 politico-religious publications. Administrative, juridical, economic, and sociological periodicals numbered 327, while those devoted to agriculture, commerce, industry, or finance were 202. The new works published in 1898 were 9670. Deducting the 926 statutes and parliamentary estimates, 715 religious works, and 604 parliamentary reports, the total is reduced to 7425. Of these 1047 were devoted to agriculture, industry or trade, 942 to medicine, 632 to history and geography, while 596 were school-books. Three hundred and thirty-two works were published in foreign languages, among them being 224 in Latin and 58 in French.

Crime.—Crime, on the whole, has increased in Italy, 526,300 crimes having been reported in 1887, and 839,506 in 1898. This increase consists chiefly of simple contraventions of bye-laws and regulations (equivalent to the English summons), which in Italy, as elsewhere, tend to grow in number as laws and regulations are multiplied and are more strictly enforced. This fails, however, to account for the whole increase, for if contraventions or summonses increased from 168,870 in 1887 to 312,423 in 1898, crimes increased during the same period from 357,430 to 527,383. Analysing these more serious breaches of the law, it is found that murders and homicides decreased by one-third in less than twenty years (5418 in 1880, and 3749 in 1898). As culture spreads, violent crime tends to diminish, but Italy still remains one of the states in which it is most frequent; after Italy come Austria, France, and, at considerable distance, Ireland, Germany, England, and Scotland. Infliction of bodily hurt remains nearly stationary (about 88,000 cases per annum, nearly half of which refer to slight wounds and blows). Libels and insults steadily increase (48,704 in 1887, and 85,332 in 1898). Violent resistance to public authority is shown to be on the increase by the occurrence of 17,301 cases in 1898, as compared with 12,354 in 1887. Crimes against property, such as serious robbery, extortion, and blackmail, fluctuate from year to year; in 1880 they numbered 3947, in 1889 1924, and in 1898 3864. Thefts or petty larcenies vary according to the condition of the country from year to year. In 1887 there were only 89,774, but in 1898, chiefly on account of the distress prevailing in that year, they rose to 137,957. Thus during twenty years murders have decreased, petty offences against persons, frauds, and resistance to authority have increased, and thefts have varied according to distress. Generally speaking, crime, and particularly violent crime, is more common in Lazio, Sardinia, Sicily, and the south than the north.

As in most civilized countries, the number of *suicides* in Italy has increased from year to year:—

Year.	Suicides.
1881	1343
1891	1697
1895	1874
1899	2019

The Italian suicide rate of 6·36 per 1,000,000 is, however, lower than those of Denmark, Switzerland, Germany, and France, while it approximates to that of England. The Italian rate varies in different provinces, it being highest in the more enlightened and industrial north, and lowest in the south. Emilia gives a maximum rate of 10·48 per 100,000, while that of Liguria and Lazio is but little lower. The minimum of 1·27 is found in the Basilicata, though Calabria gives only 2·13. The greatest number of suicides (22 per cent.) are committed with firearms, 20 per cent. by drowning, 17 per cent. by hanging, and 9 per cent. by precipitation from some elevated spot. These percentages vary, however, according to sex.

Charities.—The patrimony of Italian charitable institutions is considerable and is constantly increasing. In 1880 the number of charitable institutions (exclusive of public pawnshops, or *Monti di Pietà*, and other institutions which combine operations of credit with charity) was approximately 22,000, with an aggregate patrimony of nearly two milliards of lire, equal to £80,000,000. The revenue was about 90,000,000 lire, or, after deduction of taxes, interest on debts, expenses of management, &c., 52,000,000 lire, or £2,080,000. Adding to this 31,000,000 lire of communal and provincial subsidies, the product of the labour of inmates, temporary subscriptions, &c., the net revenue available for charity was, during 1880, 96,500,000 lire, or £3,860,000. Of this sum 6,500,000 lire was spent for religious purposes. Between 1881 and 1898 the bequests to existing institutions and sums left for the endowment of new institutions amounted to 294,796,966 lire, or about £11,792,000.

The following table shows the gradual increase of bequests for charitable purposes between 1881 and 1898:—

Year.	Number of Bequests.	Total Value of Legacies in Personal and Real Estate.
		(In lire.)
1881 . .	831	11,254,914
1891 . .	1121	11,406,023
1895 . .	1357	13,787,515
1898 . .	1569	17,245,903

Charitable institutions take, as a rule, the two forms of outdoor and indoor relief and attendance. The latter, or indoor institutions, are the more important in regard to endowment, and consist of hospitals for the infirm (692,000,000 lire of patrimony at the end of 1898); of hospitals for chronic and incurable diseases (29,000,000 lire); of orphan asylums (346,000,000 lire); of

poorhouses and shelters for beggars (143,000,000 lire); of infant asylums or institutes for the first education of children under six years of age (64,000,000 lire); of lunatic asylums (19,000,000 lire); of homes for the deaf and dumb (11,000,000 lire); and of institutes for the blind (14,500,000 lire). The outdoor charitable institutions include those which distribute help in money or food (patrimony, 220,000,000 lire); those which supply medicine and medical help (73,000,000 lire); those which aid mothers unable to rear their own children (1,500,000 lire); those which subsidize orphans and foundlings (1,500,000 lire); those which subsidize educational institutes (45,000,000 lire); and those which supply marriage portions (65,000,000 lire). Between 1881 and 1898 the chief increases took place in the endowments of hospitals (90,000,000 lire); orphan asylums (32,000,000 lire); infant asylums (31,000,000 lire); poorhouses (28,500,000 lire); almshouses (19,000,000 lire); voluntary workhouses (11,000,000 lire); and institutes for the blind (10,500,000 lire).

Italian charity legislation was reformed by the law of 17th July 1890, which attempted to provide efficacious protection for endowments, and to ensure the application of the income to the purposes for which it was intended. The law considers as "charitable institutions" all poorhouses, almshouses, and institutes which partly or wholly give help to able-bodied or infirm paupers, or seek to improve their moral and economic condition; and also the *Congregazioni di carità* (municipal charity boards existing in every commune, and composed of members elected by the municipal council), which administer funds destined for the poor in general. All charitable institutions are under the protection of provincial administrative junta, existing in every province, and empowered to control the management of charitable endowments. The supreme control is vested in the Minister of the Interior. The law also concentrates under the management of the communal charity boards (*Congregazioni di carità*) all the institutions having less than £200 a year income; those intended to assist the poor in one or more communes which together have less than 10,000 inhabitants; and especially those which, in course of time, have either become superfluous or have ceased to promote the objects for which they were instituted. The law of 1890 also empowers every citizen to appeal to the tribunals on behalf of the poor, for whose benefit a given charitable institution may have been intended.

Public pawnshops, or *Monti di Pietà*, numbered 555 in 1896, with a net patrimony of 71,986,698 lire. In that year their income, including revenue from capital, was 10,409,537 lire, and their expenditure 7,505,754. The amount lent on security was 103,830,735 lire.

The *Monti frumentarii*, or co-operative corn deposits, which lend seed corn to farmers, and are repaid after harvest with interest in kind, numbered 1615 in 1894, and possessed a patrimony of 12,000,000 lire.

In addition to the regular charitable institutions, the communal and provincial authorities exercise charity, the former to the extent of 44,000,000, and the latter to the extent of 21,500,000 lire per annum. Part of these sums is given to hospitals, and part spent directly by the communal and provincial authorities. Of the 44,000,000 spent by the communes, about 21,000,000 goes for the sanitary service (doctors, midwives, vaccination), 5,500,000 for the maintenance of foundlings, 4,000,000 for the support of the sick in hospitals, and 2,000,000 for sheltering the aged and needy. Of the 21,500,000 spent by the provincial authorities, 13,000,000 goes to lunatic asylums and 6,000,000 to the maintenance of foundling hospitals.

Religions.—The great majority of Italians are Roman Catholics. Protestants number some 62,000, of whom half are Italian and half foreign. The number of Jews was returned as 38,000, but is certainly higher. There are, besides, in Italy several thousand members of the Greek Orthodox Church. There were, on 31st December 1896, 20,183 parishes in Italy, with the same number of parish priests and about 8000 assistant parish priests. The average size of an Italian parish is 14 square kilometres, with an average population of 1550 souls. The size of parishes varies, however, from province to province, Sicily having larger parishes in virtue of the old Sicilian church laws, and Naples, and some parts of central Italy, having the smallest. The Italian parishes have a total gross revenue, including assignments from the public worship endowment fund, of 32,000,000 lire, or an average of 1572 lire (nearly £63) per parish. Fifty-one per cent. of this gross sum consists of revenue from glebe lands. The average income per parish varies in different localities. The maximum of 3077 lire is found in Sicily, and the minimum of 843 lire in Umbria.

The kingdom is divided into 276 sees and ten abbeys, or prelatures *nullius dioceseos*. Besides, the diocese of San Giovanni di Moriana is administered by a bishop domiciled in France. Except the diocese of Rome, which is administered by the cardinal-vicar, there are in Italy six suburbicarian sees governed by cardinals of the Order of Bishops; 76 immediately subject to the Holy See, 12 of which are archiepiscopal and the rest episcopal; and 193 sees composing the so-called "ecclesiastical provinces," of which 45 are archiepiscopal and 148 episcopal. Excluding the diocese of Rome and suburbicarian sees, each see has an average area of 1111 square kilometres and a population of 121,285 souls. The largest sees exist in Venetia and Lombardy, and the smallest in the provinces of Naples, Leghorn, Forlì, Ancona, Pesaro, Urbino, Caserta, Avellino, and Ascoli. The Italian sees (exclusive of Rome and of the suburbicarian sees) have a total annual revenue of 5,150,000 lire, equal to an average of 20,000 lire per see. The richest is that of Girgenti, with 157,596 lire, and the poorest that of Porto Maurizio, with only 6160 lire.

The laws which govern ecclesiastical affairs in their relation to the State are still that of 7th July 1866, which suppressed religious corporations, converted their property into consolidated stock, instituted the public worship endowment fund (*fondo per il culto*), and regulated the division of the patrimony of the suppressed corporations; and that of 19th June 1873, which extended the law of 1866 to the province and city of Rome, creating a special charitable and religious fund for the city. The objects for which the public worship endowment fund was created, namely, to support worship out of the proceeds of the sale of ecclesiastical properties, have to a great extent been attained. The fund has relieved the State exchequer of the cost of public worship; has gradually furnished to the poorer parish priests an addition to their stipends, raising them to 800 lire per annum, with the prospect of further raising them to 1000 lire; and has contributed to the outlay incurred by the communes for religious purposes. The monastic buildings required for public purposes have been made over to the communal and provincial authorities, while the same authorities have been entrusted with the administration of the ecclesiastical revenues previously set apart for charity and education, and objects of art and historical interest have been consigned to public libraries and museums.

On 30th June 1899, the patrimony of the endowment fund amounted to 440,462,790 lire, of which only 11,817,937 lire were represented by buildings. The rest was made up of capital and interest. The liabilities of the fund (capitalized) amounted to a total of 237,106,310 lire, of which monastic pensions represented 87,167,415 lire; supplementary stipends to priests, 66,025,389 lire; assignments to the Sardinian clergy, and disbursements for worship, previously incumbent upon the State, 24,895,009 lire; other ecclesiastical assignments, 22,984,835 lire. The credit balance was thus 203,356,480 lire. The chief items of annual expenditure drawn from the fund are the supplementary stipends to priests and the pensions to members of suppressed religious houses. In 1898–99 the amounts paid respectively under these headings were 3,446,783 and 4,459,500 lire. The number of persons in receipt of monastic pensions on 30th June 1899 was still 13,255. While this item of expenditure is gradually decreasing by reason of the deaths of those entitled to pensions, the supplementary stipends are gradually increasing. The following table shows the course of the two main categories of the fund from 1876 to 1898–99:—

Year.	Monastic Pensions, Liquidation of Religious Property, and Provision of Shelter for Nuns.	Supplementary Stipends to Bishops and Parochial Clergy, Assignments to Sardinian Clergy, and Expenditure for Education and Charitable Purposes.
	Lire.	Lire.
1876	18,729,311	3,572,794
1881	18,279,440	4,253,045
1885–86 . . .	12,283,487	3,213,007
1890–91 . . .	9,819,106	3,718,642
1898–99 . . .	5,661,969	5,250,512

Roman Charitable and Religious Fund.—The law of 19th June 1873 contained special provisions, in conformity with the character of Rome as the seat of the papacy, and with the situation created by the Law of Guarantees. New parishes were created, old parishes were improved, the property of the suppressed religious corporations was assigned to charitable and educational institutions and to hospitals, while property having no special application was used to form a charitable and religious fund. On 30th June 1899 the balance-sheet of this fund showed a credit amounting to 45,030,151 and a debit of 13,589,414

lire. Expenditure for the year 1898–99 was 2,192,200 lire, and revenue 2,217,133 lire.

Political Constitution.—The constitution of the kingdom of Italy has undergone no substantial change since its promulgation by King Charles Albert on 4th March 1848. Nevertheless, the constitution has been so interpreted that government has become increasingly parliamentary. Some changes have taken place in the number and functions of the departments of State, the number of ministries having been increased from nine to eleven. Under the law of 12th February 1888, the number and the attributes of ministers are fixed by royal decree, each minister being aided by an under-secretary of State, whose duties are settled by regulations drawn up by the minister. The two new ministries are those of the Treasury and of Posts and Telegraphs. The latter was detached from the Ministry of Public Works by a decree dated 10th March 1889; the former was separated from the Ministry of Finance on 24th March 1889. The office of President of the Council of Ministers was, furthermore, created. It may be held by itself or in conjunction with any other portfolio. The Presidency of the Council, however, does not form a State department by itself.

Notwithstanding various proposals for reform, the composition of the Senate remains as it was fixed by the constitution of 1848, senators being chosen by the king from among the categories of persons therein enumerated. The following table shows the composition of the Senate and the categories of persons from which senators are by preference chosen:—

	Senators Created between 3rd April 1848 and 2nd March 1897.	Living and in Discharge of Senatorial Functions on 2nd March 1897.
Ministers, Deputies and Presidents of Provincial Councils (Categories II., V., and XVI.)	387	178
Higher Civil and Military Officials (Categories VI., XV., XVII.)	310	90
Large Taxpayers (Category XXI.)	286	84
Eminent Scientists, Men of Letters, Artists, or men having rendered signal service to the country (Categories XVIII., XIX., and XX.)	135	28
High Ecclesiastical Dignitaries (Category I.)	7	...
Totals	1125	380

Comparing the number of senators with the calculated population of the country on 31st December 1896, it is seen that the 66 provinces of the realm represented in the Senate were represented in very unequal proportions. While seven provinces (Genoa, Palermo, Porto Maurizio, Turin, Leghorn, Naples, and Milan) had each one senator for a unit of population varying from 36,385 to 44,658 inhabitants, four provinces (Treviso, Aquila, Sassari, and Parma) had only one senator for a minimum unit of 250,000 and a maximum of 413,635 inhabitants.

The Chamber of Deputies has been profoundly modified by the franchise extension of 1882, although the status and rights of its members are still those defined by the constitution of 1848. The franchise extension considerably enlarged the electorate, and, except for slight modifications, has not since been changed. On the other hand, the electoral system, which, according to the law of 1882, was to be that known as *scrutinio di lista*, has been repeatedly altered. On 5th May 1891 the *scrutinio di lista* was abandoned in favour of the old system of uninominal constituencies, which still remains in force, although attempts have again been made to return to the *scrutinio di lista*. Under the electoral law now in force (law of 28th March 1895) the electors must possess Italian civil and political rights either by birth or naturalization, must have completed twenty-one years of age, and must know how to read and write. In addition, electors must have gone through the first standard of primary education, and must pay in direct taxation not less than 19·80 lire a year, or a certain house rent, which varies according to the population of the different communes. The reform of 1882 more than tripled the number of electors, who in 1900 numbered more than 2,000,000. In proportion to population there are 7·08 electors per 100 inhabitants throughout the kingdom, but this ratio varies greatly from one district to another, Piedmont having, for instance, 11 per cent. of electors, and Sicily less than 4 per cent. The number of constituencies, which by the law of 1860 was fixed at 443, was raised subsequently to 508. Under the *scrutinio di lista*, in which each elector voted for a number of deputies, the list-constituencies numbered 135, but upon the abolition of the *scrutinio di lista* the number of constituencies again became 508. At present the average number of inhabitants per constituency is slightly more than 61,000, but only 44 of the 508 constituencies have a population approximating to the average, while half of the remainder are below the average and half above, the maximum being 75,000 inhabitants:—

Year.	Number of Constituencies.	Number of Deputies.	Number of Registered Electors.[1] Total.	Per 100 Inhabitants.
1879	508	508	621,896	2·22
1882	135	508	2,017,829	7·07
1890	135	508	2,752,658	9·16
1892	508	508	2,934,445	9·64
1898	508	508	2,247,031	7·12

[1] Exclusive of electors temporarily deprived of their rights owing to their positions as non-commissioned officers or men of the army and navy, or as members of corps organized on a military basis by the State, the provinces, or the communes.

The number of voters has considerably increased, but the proportion of electors who go to the poll has remained about 60 per cent., notwithstanding the reform of 1882:—

Date of General Election.	Number of Voters at First Ballot.	Number of Voters per 100 Registered Electors.
16th May 1880 (before extension of franchise)	369,627	59·44
29th October 1882 (immediately after extension)	1,223,851	60·65
3rd June 1900 (general election)	1,310,480	58·28

The proportion of qualified electors to population is higher in the north than in the south, on account of the greater diffusion of education. The number of voters to registered electors is, however, higher in the south, because the electorate is more organized and more directly under the influence of the upper classes and the party chiefs.

Administration of Justice.—No change has taken place in the organization of civil courts (offices of conciliation, praetors' offices, ordinary tribunals, courts of appeal, Court of Cassation), nor in that of penal courts (praetors' offices, offices of examining magistrates, ordinary tribunals, indictment divisions, courts of appeal, Court of Cassation); some changes have, however, been introduced in the competence and number of these authorities. By the law of 16th June 1892, offices of conciliation were made competent to deal with disputes involving sums up to 100 lire, instead of 50 lire as previously. No money limit

was set to their competence as conciliators in cases where their good offices are requested. Praetors were made competent to deal with cases involving sums above 100 lire, but below the limit (1500 lire) of the competence of the civil tribunals. The changes in the competence of conciliators affected the praetors, since conciliators' sentences, which had been final as long as their competence was limited to 50 lire, became susceptible of appeal before the praetors when relating to sums between 50 and 100 lire. More important were the changes introduced by the promulgation, on 1st January 1890, of a single penal code for the whole kingdom in place of the two codes previously existing. The new code reformed the whole penal system, both as regards the underlying juridical principles and the degrees of punishment. Penalties on the whole were rendered less severe, but were more strictly applied, especially as regards solitary confinement, while money fines were considerably extended as single and optional punishments. The competence of the praetors was reduced, and, in place of dealing with all offences liable to punishment by prison or exile for not more than three months, or by fines up to 300 lire, their action was limited to minor offences and to venal contraventions of the law. A part of their competence passed to the tribunals which now deal with all cases punishable by imprisonment up to ten years and with serious breaches of the law. The tribunals thus encroached upon the competence of the Assize Courts, which, with an assize jury, deal with all crimes liable to penalties of more than ten years' imprisonment, and with all political crimes. These changes in the competence of the tribunals of first instance affected also the courts of appeal, since the competence of the ordinary tribunals, sitting in appeal as judges on penal sentences passed by the praetors, has been enlarged, and these tribunals now deal with a larger proportion of cases. The competence of the courts of appeal proper, which deal principally with sentences of the ordinary tribunals, has on the one hand been restricted by the enlargement of the competence of praetors in regard to cases formerly dealt with by the ordinary tribunals, and on the other has been extended by the enlargement of the competence of the ordinary tribunals to deal with cases formerly reserved for assize courts. The sentences of assize courts continue to be final in points of merit, and can only be impugned on points of form on appeals to the Rome Court of Cassation.

Some changes have taken place in the number of judicial institutions. The tribunals of commerce were abolished in 1888; the *preture* or praetors' offices, which up to 31st December 1891 numbered 1819, were reduced to 1549; and the competence of the courts of cassation has been modified. Prior to 1888 there were five courts of cassation (Turin, Florence, Naples, Palermo, and Rome), which, while instituted for the purpose of ensuring exact observance of the law, dealt in penal cases with the sentences of praetors not otherwise subject to appeal; with sentences of the ordinary tribunals sitting as courts of appeal upon praetors' judgments; with sentences of the courts of appeal proper and of assize courts; and, in civil cases, with sentences pronounced by the courts of appeal. Since 1888, jurisdiction in penal cases has been reserved to the Rome Court of Cassation, which, besides sharing with the other four courts of cassation jurisdiction in civil affairs, possesses special competence to deal with disputes between the judicial and administrative authorities, and between lesser judicial authorities.

The number of commercial and civil suits annually begun increased from 1,201,560 in 1881 to 1,469,300 in 1898. The increase applies not to the higher grades of jurisdiction (appeals of all categories tend to diminish), but to the cases brought before the offices of conciliation and the praetors, which increased from 571,596 in 1875 to 1,340,324 in 1898.

The statistics of civil proceedings vary considerably from province to province. Lombardy, with 25 lawsuits per 1000 inhabitants, holds the lowest place; Emilia comes next with 31 per 1000; Tuscany has 39; Venetia, 42; Calabria, 144; Rome, 146; Apulia, 153; and Sardinia, 360 per 1000. The high average in Sardinia is chiefly due to cases within the competence of the conciliation offices, the difference between Sardinia and the mainland being much less noticeable in regard to cases within the jurisdiction of other courts. The number of penal proceedings, especially those within the competence of praetors, has also increased, chiefly on account of the frequency of minor contraventions of the law referred to in the section *Crime*. As in the case of civil suits, the ratio of criminal proceedings to population varies from province to province, but is, as a rule, much higher in the south than in the north.

The introduction of the new penal code in 1890 modified to some extent the prison system previously existing. A royal decree, dated 1st February 1891, established three classes of prisons:—judiciary prisons, for persons awaiting examination or persons sentenced to arrest, detention, or seclusion for less than six months; penitentiaries of various kinds (*ergastoli*, *case di reclusione*, *detenzione*, or *custodia*), for criminals condemned to long terms of imprisonment; and reformatories, for criminals under age and vagabonds. Certain types of dangerous individuals are relegated to special penal colonies known as *domicilii coatti*, or "forced residences." These establishments are, however, unsatisfactory, and a Bill for their abolition has already been promoted. On 31st December 1898 the number of prisons and cells was as follows:—

	Number of Prisons.	Number of Places.	Cells. For Continual Solitary Confinement.	Cells. For Nocturnal Solitary Confinement.
Judiciary Prisons	1456	65,401	5879	251
Penitentiaries	82	30,759	3589	2432
Reformatories, State	9	1,940	24	1262
Reformatories, Private	34	5,825	...	...
Totals	1581	103,925	9492	3945

Notwithstanding the construction of new prisons and the transformation of old ones, the number of cells for solitary confinement is still insufficient for a complete application of the penal system established by the code of 1890. The total number of prisoners, including minors and inhabitants of enforced residences, which from 76,066 (2·84 per 1000 inhabitants) on 31st December 1871 rose to a maximum of 80,792 on 31st December 1879 (2·87 per 1000), decreased gradually, notwithstanding some slight fluctuations, to a minimum of 60,621 in 1896 (1·94 per 1000), and on 31st December 1898 rose again to 75,470 (2·38 per 1000), of whom 75,470, less than one-tenth, or 7038, were women.

Army.—The organization of the Italian army has undergone no substantial change since the promulgation of the Army Bill of 7th June 1875, in virtue of which the military forces of the kingdom are divided into three categories:—(*a*) Standing army, (*b*) mobile militia, and (*c*) territorial militia. Nevertheless the number of men enrolled in these three categories has continually increased. Thus:—

Date.	Total. Officers.[1]	Total. Men.	Standing Army.	Mobile Militia.	Territorial Militia.
30th Sept. 1871	14,070	521,969	536,039	...	...
,, 1876	17,440	1,028,203	626,934	270,973	143,943
,, 1881	22,482	1,833,554	731,149	294,714	823,970
30th June 1886	31,193	2,464,680	898,505	283,437	1,302,709
,, 1891	36,739	2,821,367	843,160	445,315	1,553,784
,, 1898	35,765	3,221,726	828,543	465,361	1,946,418

[1] Including complementary officers on auxiliary service or in the reserve.

On 30th September 1871 the various categories of the army included only 2 per cent. of the population, but on 30th June 1898 they included 10 per cent. The increase is due to the effect of the Bill of 1875, which rendered all citizens liable to some form of military service until the completion of their 39th year. The above figures would undergo considerable reduction in case of mobilization, on account of deaths, illness, desertions, and foreign residence. Nor would the city guards, customs officers, prison guards, post office and railway employees be included in the mobilized army.

The standing army is divided into twelve army corps and twenty-five divisions. At present the army corps, with their respective divisions, are distributed as follows. The divisions are given in parentheses:—I., Turin (1st Turin, 2nd Novara); II., Alessandria (3rd Alessandria, 4th Cuneo); III., Milan (5th Milan, 6th Brescia); IV., Genoa (7th Piacenza, 8th Genoa); V., Verona (9th Verona, 10th Padua); VI., Bologna (11th Bologna, 12th Ravenna); VII., Ancona (13th Ancona, 14th Chieti); VIII., Florence (15th Florence, 16th Leghorn); IX., Rome (17th Rome, 18th Perugia, 25th Cagliari); X., Naples (19th Naples, 20th Salerno); XI., Bari (21st Bari, 22nd Catanzaro); XII., Palermo (23rd Palermo, 24th Messina).

Ordinary and extraordinary military expenditure for the financial year 1898–99 amounted to 246,647,646 lire, an increase of more than 97,000,000 lire as compared with 1871, when the expenditure was 149,584,632 lire. During the discussion of the military estimates for 1901–2, however, the Italian Chamber, in view of the tendency towards an increase of military expenditure, decided that for the following six years, *i.e.*, from 1st July 1901 until 30th June 1907, Italian military expenditure proper should not exceed the maximum of 239,000,000 lire fixed by the Army Bill of May 1897, and that the sum annually expended on military pensions should not exceed 36,000,000 lire. Thus, in the absence of unforeseen complications, Italian military expenditure may until 1907 be regarded as consolidated at 275,000,000 lire (£11,000,000) per annum, including £9,560,000 for the army proper and £1,440,000 for pensions.

Navy.—The conditions of service in the Italian navy were considerably modified by the Navy Bills of 28th August 1885, 12th July 1888, 30th June 1899, and 1st February 1900. Able-bodied men enrolled for naval service are divided into three categories:—(*a*) Men required for active service, whose number is fixed every year by law; (*b*) able-bodied supernumeraries not required for active service. These two categories are sorted by lot. (*c*) Able-bodied men exempt from active service for family reasons or other causes. Third category men belong to the naval reserve, into which men of the first and second categories pass after twelve years' liability to active service. For purposes of naval organization the Italian coast is divided into three maritime departments, with headquarters at Spezia, Naples, and Venice; and into two *comandi militari*, with headquarters at Taranto and at the island of Maddalena. The *personnel* of the navy consists of the following corps:—(1) General staff; (2) naval engineers, chiefly employed in building and repairing war vessels; (3) sanitary corps; (4) commissariat corps, for supplies and account-keeping; (5) crews. The following table shows the variations in the number of the *personnel* from 1872 to 1898, the increase noticeable from 1886 onwards being due to the circumstance that the Bill of 28th August 1885 abolished absolute exemption from naval service, and assigned certain duty to the third category men formerly exempt:—

Year.	Officers.	Men.	Total.
1872 . .	1173	10,766	11,939
1876 . .	1073	22,611	23,684
1881 . .	980	34,914	35,894
1886 . .	1066	40,884	41,950
1891 . .	2201	71,397	73,598
1896 . .	2322	94,851	97,173
1897 . .	2385	97,501	99,886
1898 . .	2359	100,513	102,872

The *matériel* of the Italian navy has been completely transformed, especially in virtue of the Bill of 31st March 1875. Old types of vessels have been sold or demolished, and replaced by newer types. The number and tonnage of the ships, with their crews, up to the end of 1899 are given in the following table:—

Year.	Total Number of Ships Built, in Course of Construction, or Fitting Out.			Ships in Service.							
				Ships in Service. Total.	Armoured.			Unarmoured.			
	Total.	Armoured.	Unarmoured.		No. of Ships.	Tonnage.	Crews.	No. of Ships.	Tonnage.	Crews.
31st December 1876 . .	73	18	55	65	14	59,330	5638	51	50,812	5,774

Total	18	299	317	49	231	2	35	304,299·9	509,289	1678

At the same date 21 new vessels were in course of construction or were being fitted out for active service; 9 of these were armoured and 12 unarmoured. Of the armoured vessels, 4 were first class and 5 second class battleships; of the unarmoured, 3 were battleships of the fifth and sixth classes, 8 destroyers, and 1 auxiliary vessel.

Naval expenditure has enormously increased since 1871, the total for 1871 having been 22,116,710 lire, and the total for 1898–99 105,438,874 lire, an increase of more than 83,000,000 lire. Violent fluctuations have, however, taken place from year to year, according to the state of Italian finances. In order to obviate this drawback, and to permit the steady execution of a normal programme of shipbuilding, the Italian Chamber, on 4th May 1901, adopted a resolution limiting naval expenditure, inclusive of naval pensions and of premiums on mercantile shipbuilding, to the sum of 121,000,000 lire (£4,840,000) for the following six years, *i.e.*, from 1st July 1901 until 30th June 1907. This sum consists of 106,000,000 lire (£4,240,000) of naval expenditure proper,

5,500,000 lire (£220,000) for naval pensions, and of 9,500,000 lire (£380,000) for premiums upon mercantile shipbuilding. During the financial year ending 30th June 1901 these figures were slightly exceeded, the total naval expenditure being 123,000,000 lire (£4,920,000), made up of 106,000,000 for the navy proper, 5,200,000 for naval pensions, and 11,800,000 for premiums to the mercantile marine.

Finances.—The volume of the Italian budget has considerably increased both as regards income and expenditure. The income of 1,518,535,464 lire in 1881 rose in 1899–1900 to 1,747,928,147 lire; while the expenditure increased from 1,467,648,226 lire in 1881 to 1,742,717,661 in 1899–1900, an increase of about 230,000,000 lire in income and 275,000,000 in expenditure. These figures include not only the categories of "income and expenditure" proper, but also those known as "movement of capital," "railway constructions," and "*partite di giro*," which, while they form part of the Italian budgetary system, do not constitute by themselves real income and expenditure.[1] Considering only income and expenditure proper, the totals from 1882 to 1889–1900 are:—

Financial Year.	Revenue (in Millions of Lire).	Expenditure (in Millions of Lire).	Surpluses or Deficits (in Millions of Lire).
1882	1301·62	1297·62	+4·00
1885–86	1409·10	1432·61	−23·51
1890–91	1540·00	1615·04	−75·04
1895–96	1633·60	1699·07	−65·47
1898–99	1658·82	1626·16	+32·66
1899-1900	1671·52	1633·09	+38·43
1900–1901	1720·73	1652·36	+68·37

The financial year 1862 closed with a deficit of more than 400,000,000 lire, which increased in 1866 to 721,000,000 lire on account of the preparations for the war against Austria. Excepting the increases of deficit in 1868 and 1870, the annual deficits tended thenceforward to decrease, until in 1875 equilibrium between expenditure and revenue was attained, and was maintained until 1881. Advantage was taken of the equilibrium to abolish certain imposts, amongst them the grist tax, which prior to its gradual repeal produced more than 80,000,000 lire a year. From 1885–86 onwards, outlay on public works, military and colonial expenditure, and especially the commercial and financial crises, contributed to produce annual deficits; but owing to drastic reforms introduced in 1894–95 and to careful management the year 1898–99 marked a return of surpluses (nearly 33,000,000 lire), and 1899–1900 gave a surplus of 38,000,000 lire.

The proportion of revenue derived from the various fiscal and other sources during 1899–1900 is shown by the following figures:—

[1] "Movement of capital" consists, as regards "income," of the proceeds of the sale of buildings, Church or Crown lands, old prisons, barracks, &c., or of moneys derived from sale of consolidated stock. Thus 'income" really signifies diminution of patrimony or increase of debt. In regard to "expenditure," "movement of capital" refers to extinction of debt by amortization or otherwise, to purchases of buildings, or to advances made by the State, as, for instance, the Italian instalment of the loan granted by the Powers to the provisional government of Crete. Thus "expenditure" really represents a patrimonial improvement, a creation of credit, or a decrease of indebtedness. The items referring to "railway construction" represent, on the one hand, repayments made to the exchequer by the communes and provinces of money disbursed on their account by the State Treasury; and, on the other, the cost of new railways incurred by the Treasury. The items of the "*partite di giro*" are inscribed both on the credit and debit sides of the budget, and have merely a figurative value, as, for instance, when the rent of a barracks belonging to the State is in the general estimates debited to the War Office and credited to the Treasury, while in the War Office estimate the rent of the same barracks would be debited to the Treasury and credited to the War Office.

	Millions of Lire.	Percentage of Total Revenue.
Crown lands and properties	102·40	6·1
Imposts, taxes, and trade monopolies	1409·71	84·7
Proceeds of public services (posts, telegraphs, &c.)	98·01	6·0
Repayments and contributions from provinces, communes, &c.	23·05	1·4
Sundry revenues	31·23	1·8

The State therefore draws its principal revenues from the imposts, the taxes, and the monopolies. According to the Italian tributary system, "imposts," properly so called, are those upon land, buildings, and personal estate. The impost upon land is based upon the cadastral survey independently of the vicissitudes of harvests, Italian territory being divided for this purpose into nine cadastral compartments. In 1869 the main quota of the impost was increased by one-tenth, in addition to the extra two-tenths previously imposed in 1866. Subsequently, however, it was decided to repeal these additional tenths, the first being abolished in 1886 and the rest in 1887. On account of the inequalities still existing in the cadastral survey, in spite of the law of 1886 (see *Agriculture*, above), great differences are to be found in the land tax assessments in various parts of Italy. Land is not so heavily burdened by the Government quota as by the additional centimes imposed by the provincial and communal authorities. It may be calculated that on an average Italian landowners pay nearly 25 per cent. of their revenues from land in the various forms of government and local land tax. The buildings impost has been assessed since 1866 upon the basis of 12·50 per cent. of "taxable revenue." Taxable revenue corresponds to two-thirds of actual income from factories and to three-fourths of actual income from houses; it is ascertained by the agents of the financial administration. In 1869, however, a third additional tenth was added to the previously existing additional two-tenths, and, unlike the tenths of the land tax, they have not since been abolished. At present the main quota with the additional three-tenths amounts to 16·25 per cent. of taxable income. The imposts on incomes from personal estate (*ricchezza mobile*) were introduced in 1866; it is not a general income tax, but applies to incomes derived from investments, industry, or personal enterprise, but not to landed revenues. It is proportional, and is collected by deduction from salaries and pensions paid to servants of the State, and from interest on consolidated stock; and by register in the cases of professional men, capitalists, or manufacturers. From 1871 to 1894 it was assessed at 13·20 per cent. of taxable income, this quota being formed of 12 per cent. main quota and 1·20 per cent. as an additional tenth. In 1894 the quota, including the additional tenth, was raised to the uniform level of 20 per cent.

Taxes proper are divided into (*a*) taxes on business transactions and (*b*) taxes on articles of consumption. The former apply principally to successions, stamps, registrations, mortgages, &c.; the latter to distilleries, breweries, explosives, native sugar, and matches, though the customs revenue and octrois upon articles of general consumption, such as corn, wine, spirits, meat, flour, petroleum, butter, tea, coffee, and sugar, may be considered as belonging to this class.

The monopolies are those of salt, tobacco, and the *lotto*.

In the financial year 1899–1900 the largest revenue was yielded by the income tax on personal estate or *ricchezza mobile* (289,000,000 lire), and by the customs and maritime dues (244,000,000 lire). The taxes on business transactions yielded 200,000,000 lire; the tobacco monopoly, 196,000,000; the land tax, 106,000,000; the buildings tax, 89,000,000; the salt monopoly, 74,000,000;

the lotto, 71,000,000; the octrois, 53,000,000; and the tax on manufactures, 64,000,000.

Since 1880, while income from the salt and lotto monopolies has remained almost stationary, and that from land tax and octroi has diminished, revenue derived from all other sources has notably increased, especially that from the income tax on personal estate, the customs, and the tobacco monopoly, the yield from which has been doubled as regards the first, and tripled as regards the two latter.

With regard to *expenditure*, the following table demonstrates the chief items which make up the total amount:—

	Millions of Lire.	Percentage.
Consolidated and redeemable debt, pensions, and royal civil list	728·35	44·60
Cost of general administration	45·10	2·76
Cost of collecting taxes, imposts, &c.	163·56	10·00
Cost of civil services (justice, education, agriculture, &c.)	267·56	15·77
Military and naval services	346·82	21·24
Civil and military services in Africa (Eritrea, Somaliland, &c.)	9·11	0·56
Other expenditure (railways, Church lands, &c.)	82·60	5·07
Total	1643·10	100·00

Nearly half the total expenditure is absorbed by interest on debt, which in the financial year 1899–1900 amounted to about 689,000,000 lire, exclusive of the 83,000,000 lire required for civil and military pensions. Debt has continually increased with the development of the State, especially as regards the military and civil services and the provision of railways and public works. The sum paid in interest on debt amounted to 441,000,000 lire in 1871, 486,000,000 in 1881, 640,000,000 in 1891–92, and 689,000,000 in 1899–1900. Next in order of importance comes naval and military expenditure, which in 1899–1900 amounted to 347,000,000 lire, or 243,000,000 for the army and 104,000,000 for the navy.[1] Of the 257,000,000 lire required for the various civil services, 61,000,000 are absorbed by posts and telegraphs, 48,000,000 by education, 32,000,000 by the administration of justice, 26,000,000 by prisons, 18,000,000 by police, while only 12,000,000 are allotted to agriculture, industry, and trade.

Since 1880 military expenditure has risen from 209,000,000 to 239,000,000, and the naval from little more than 40,000,000 to 104,000,000.

At the beginning of the financial year 1899–1900 the value of the patrimony of the State was calculated to be nearly eight milliards (7,974,901,559 lire). At the same time the indebtedness of the State was more than twice as much (16,435,941,523 lire). The credit side included railways, canals, salt, tobacco, telegraphs, &c., for 4,236 million lire; military and naval material, 1651 millions; land, buildings, furniture, and securities, 602 millions; Treasury balance, 655 millions; property of the State services, 632 millions; and scientific and artistic objects, 221 millions. The debit side included consolidated stock and redeemable debt, 14,669 millions; pensions (capitalized), 1634 millions; Treasury debt and State notes having forced currency, 11,482 millions.

Local Government.—Italian local government, or the provincial or communal administrative system, was modified by the law of 10th February 1889 and by posterior enactments. The elective principle has been extended in regard to the choice of syndics or mayors, who were previously royal nominees, but are now elected by a secret ballot of the communal council. In the provincial administrations the functions of the prefects have been curtailed. Whereas the prefect was formerly *ex officio* president of the provincial deputation or executive committee of the provincial council, his duties under the present law are reduced to mere participation in the management of provincial affairs, the president of the provincial deputation being chosen among and elected by the members of the deputation. The most important change introduced by the new law has been the creation in every province of a provincial administrative junta entrusted with the supervision of communal administrations, a function previously discharged by the provincial deputation. Each provincial administrative junta is composed, in part, of Government nominees (the prefect, acting as president, two councillors of the prefecture, and a supernumerary appointed at the beginning of every year by the Minister of the Interior), and in part of elective elements (four members and two supernumeraries), elected by the provincial council for four years, half of whom require to be elected every two years. The acts of communal administration requiring the sanction of the provincial administrative junta are chiefly financial (sale or purchase of property; investments, other than purchases of buildings; loans on mortgage security; leases for more than twelve years; expenditure affecting the communal budget for more than five years; modifications of the octroi and other communal imposts; or changes in police and building regulations). Both communal councils and prefects may appeal to the Government against the decision of the provincial administrative juntas, the Government being guided by the opinion of the Council of State. Besides possessing competence in regard to local government elections, which previously came within the jurisdiction of the provincial deputations, the provincial administrative juntas discharge magisterial functions in administrative affairs, and deal with appeals presented by private persons against acts of the communal and provincial administrations. The juntas are in this respect organs of the administrative jurisprudence created in Italy by the law of 1st May 1890, in order to provide juridical protection for those rights and interests outside the competence of the ordinary tribunals.[1]

The former qualifications for electorship in local government elections (to be an Italian citizen, to be able to read and write, and to have completed the twentieth year of age) have been modified, and it is now sufficient to pay five lire annually in direct taxes, five lire of certain communal taxes, or a certain rental (which varies according to the population of a commune), instead of being obliged to pay, as previously, at least five lire annually of direct taxes to the State. In consequence of this change the number of local electors increased by more than one-third between 1887–89; it decreased, however, as a result of an extraordinary revision of the registers in 1894.

Year.		Number of Qualified Local Electors.	
		Totals.	Per 100 Inhabitants.
1883	Before the Reform	1,849,304	6·43
1887		2,026,619	6·87
1889	After the Reform	3,343,875	11·19
1895		2,772,934	8·94
1898		2,894,592	9·17

[1] During the discussion of the estimates for the financial year 1901–1902 the Chamber and Senate adopted resolutions consolidating Italian military and naval expenditure for the following six years at a total of 396,000,000 lire annually, inclusive of naval and military pensions and of premiums on mercantile shipbuilding (see sections *Army* and *Navy*).

[1] In addition to the magisterial functions of the provincial administrative juntas, and with the same object of providing juridical protection for private interests, otherwise undefended, a fourth section of the Council of State was instituted in 1889, with competence to deal with the following matters: (*a*) To decide with regard to appeals based on pleas of incompetence, abuse of power, or infractions of law, which may be presented by individuals, or corporate personalities, against enactments of local authorities or administrative bodies; (*b*) to decide both as regards merit and form in cases of controversy between the State and its creditors, in matters relating to the interpretation of contracts, public loans, seizures of the temporalities of bishops and priests, and boundary disputes between communes and provinces.

The ratio of local electors to population varies greatly in the different provinces. In Piedmont it is 79 per cent., but in Sicily less than 45 per cent. The ratio of voters to qualified electors tends to increase; it is highest in Campania, Basilicata, and in the south generally; the lowest percentages are given by Emilia and Liguria:—

Year.	Number of Voters.	
	Totals.	Per 100 Qualified Voters.
1887	893,050	44·07
1889	2,002,630	59·89
1895	1,762,081	63·55

Local finance in Italy is regulated by the communal and provincial law of 4th May 1898, which, while retaining the fundamental characteristics of previous legislation, provided more efficacious control over the communes by instituting provincial administrative juntas, empowered to examine and sanction the acts of the communal financial administrations. As has been already explained, the sanction of the provincial administrative junta is necessary for sales or purchases of property, alterations of rates (although in case of increase the junta can only act upon request of ratepayers paying an aggregate of one-twentieth of the local direct taxation), and expenditure affecting the communal budget for more than five years. The provincial administrative junta is, moreover, empowered to order "obligatory" expenditure, such as the upkeep of roads, sanitary works, lighting, police, charities, education, &c., in case such expenditure is neglected by the communal authorities. The cost of fire brigades, infant asylums, evening and holiday schools, is classed as "optional" expenditure. Communal revenues are drawn from the proceeds of communal property, interest upon capital, taxes and local dues. The most important of the local dues is the gate tax, or *dazio di consumo*, which may be either a surtax upon commodities (such as alcoholic drinks or meat), having already paid customs duty at the frontier, in which case the local surtax may not exceed 50 per cent. of the frontier duty, or an exclusively communal duty limited to 10 per cent. on flour, bread, and farinaceous products,[1] and to 20 per cent. upon other commodities.

In addition, the communes have a right to levy a surtax not exceeding 50 per cent. of the quota levied by the State upon lands and buildings; a family tax, or *fuocatico*, upon the total incomes of families, which, for fiscal purposes, are divided into various categories; a tax based upon the rent-value of houses, and other taxes upon cattle, horses, carriages, and servants. Occasional sources of interest are found in the sale of communal property, the realization of communal credits, and the contraction of debt.

According to the statistics for 1897, the total revenue proper of the communes was 554,008,117 lire, of which 157,416,184 lire were yielded by gate tax, or octroi, and 132,961,697 by the surtax on lands and buildings; 21,000,000 lire were furnished by the family tax; 15,000,000 lire by the cattle tax, and 6,000,000 lire by the shop tax. Patrimonial revenues yielded 15,000,000 lire, while new debt was contracted for 81,000,000 lire. Including money raised by loan, revenue balanced expenditure, 97,000,000 being spent in administration; 86,000,000 for local and sanitary police; 77,000,000 for public works; 76,000,000 for education; 27,000,000 for public worship and charity; and 11,000 for general police and administration of justice. Interest on debt absorbed 53,000,000 lire out of a total of 170,000,000 lire of the expenditure classed as "patrimonial burdens," which, *inter alia*, included the cost of tax collection, &c. Since 1880 communal revenue has greatly increased. The chief increases in expenditure come under the heads of "patrimonial burdens," especially as regards interest on debt, local and sanitary police (from 52,000,000 to 86,000,000 lire), and for education (from 50,000,000 to 75,000,000 lire).

The provincial administrations, which act as links between the communes and the State, are entrusted with the management of the affairs of the provinces in general, as distinguished from those of the communes. Their expenditure is likewise classed as "obligatory" and "optional." The former category comprises the maintenance of provincial roads, bridges, and watercourse embankments; secondary education, whenever this is not provided for by private institutions or by the State (elementary education being maintained by the communes), and the maintenance of foundlings and pauper lunatics. "Optional" expenditure includes the cost of services of general public interest, though not strictly indispensable. Provincial revenues are drawn from provincial property, school taxes, tolls, and surtaxes on land and buildings. The provincial surtaxes may not exceed 50 per cent. of the quotas levied by the State. In 1897 the total provincial revenue was 93,306,335 lire, of which 86,500,000 lire were obtained from the surtax upon lands and buildings. Expenditure amounted to 94,222,208 lire, of which the principal items were 19,000,000 for roads and bridges, 13,000,000 for lunatic asylums, 6,000,000 for foundling hospitals, 8,000,000 for interest on debt, and 5,000,000 for police. Like communal revenue, provincial revenue has considerably increased since 1880, principally on account of the increase in the land and building surtax.

The Italian local authorities, communes and provinces alike, have considerably increased their indebtedness since 1882. The ratio of communal and provincial debt per inhabitant has grown from 30·79 lire to 43·70 lire, an increase due in great part to the need for improved buildings, hygienic reforms, and education, but also attributable in part to the manner in which the finances of many communes are administered.

RECENT HISTORY.

Few dates in modern European history equal in significance that of 20th September 1870, when the Italian troops under General Cadorna took possession of Rome in the name of the Italian nation, and completed at one stroke both the work of the Risorgimento and the destruction of the temporal power of the Roman pontiff. The adoption on 2nd October, by 133,681 votes against 1507, of the plebiscitary formula, "We desire our union to the kingdom of Italy under the constitutional monarchical government of King Victor Emmanuel II. and of his successors," merely conferred formal popular sanction upon the act of capitulation previously signed by the papal General Kanzler with the approval of the pope and his advisers.

The Roman Question.

For many years the destruction of the pope's temporal sovereignty had been recognized as a corollary to, if not a synonym for, the complete union of Italy. Dreamers or timorous politicians alone believed compromise possible. "Under the ægis of free institutions we leave to the wisdom of the Italian Government the task of assuring the independence of the spiritual authority of the pontiff"—declared the proclamation by which the provisional junta of Roman citizens called upon the people of the Papal States to accomplish the plebiscite. In the mind of the Italian Government and nation, and of a considerable proportion of the Italian clergy, no necessary connexion existed between the pope's temporal power and his spiritual

[1] At the beginning of 1902 the Italian Parliament sanctioned a Bill providing for the abolition of municipal duties on bread and farinaceous products within three years of the promulgation of the Bill on 1st July 1902.

independence. The Vatican and its supporters held, and hold, a contrary view. Their opposition, indeed, had proved a source of discord between Italy, France, and the Curia ever since Cavour, on 26th March 1861, had declared to the Subalpine parliament, "Only Rome can be the capital of Italy." Cavour's untimely death (6th June 1861) had interrupted his negotiations with Napoleon for the withdrawal of the French garrison from Rome, negotiations which Napoleon had declined to continue with Ricasoli, successor of Cavour, in spite of Ricasoli's declaration that Italy desired to go to Rome, "not with the help of inopportune, insurrectionary elements, but in full agreement with France, in order to restore to the Church that freedom and independence, that simplicity of discipline, whereby she had attained power and renown in the early centuries of her existence." The advent of the weak and tortuous Rattazzi administration (March 1862) had led to the ill-considered Garibaldian enterprise against Rome, which ended pitifully at Aspromonte (29th August 1862), and which increased, on the one hand, the diffidence of France, and on the other, the impatience of the Italian Radical "party of action." Not until 1864 was it possible for the Minghetti–Visconti Venosta cabinet to conclude with France, on the lines laid down by Cavour, a convention (15th September 1864) arranging for the evacuation of Rome by the French troops within two years, on condition that Italy should respect and enforce respect of papal territory, and should, as a pledge of abstention from immediate designs upon Rome, transport her capital from Turin to Florence. The "September convention" has been the subject of prolonged and bitter controversy; but it has not always been borne in mind that in 1864 the approaching downfall of the French empire could not be foreseen, nor that the solution of the Roman question must then have appeared strictly contingent upon the will of Napoleon. As long as France remained directly responsible for the integrity of the papal domain, any attempt to complete Italian unity could but arouse her hostility. The imperial troops once withdrawn, Italy might trust to "moral means," *i.e.*, to the strength of unitary sentiment, and to the efforts of patriotic committees in the papal states, to hasten the consummation of her Risorgimento. If, by guaranteeing papal territory against attack, Minghetti and his colleagues undertook an ungrateful task, and seemed to forego, or indefinitely to postpone, the realization of unitary aspirations, their error was remedied by their successor, La Marmora, who in a note addressed to the French Government on 7th November 1864 formally reserved for Italy freedom in regard to those national aspirations, "which, by their very nature, belonged to the national conscience, and could not be discussed between two Governments." Judged in the light of subsequent events, the September convention is seen to have marked the first stage on the road to Rome, and to have secured for Italy, by the withdrawal of the French garrison, a diplomatic advantage which even Clerical trickery in connexion with the Legion of Antibes failed substantially to affect.

Any expectation that the transfer of the Italian capital to Florence (February 1865) and the evacuation of Rome by the French (December 1866) would have convinced the Vatican of the wisdom of conciliation with Italy was upset by the failure of two Italian missions to Rome, conducted by Vegezzi (April–June 1865) and by Tonello (December 1866). Moreover, the question of a *modus vivendi* between Italy and the papacy was complicated in 1867 by the return of Rattazzi to power. While explicitly accepting and promising loyally to execute the September convention, Rattazzi connived at Garibaldi's ill-starred adventure, which afforded a pretext for the reoccupation of Rome by the French (30th October 1867), and ended in the catastrophe of Mentana (3rd November 1867). Though Rome was again evacuated in the following month, a French garrison, 5000 strong, at Civitavecchia, lent point to Rouher's famous declaration (5th December 1867), that Italy would "never" be allowed to take possession of Rome. In Italy this declaration was met two days later by a resolution in which the Senate reaffirmed the Italian claim to Rome as capital. Anxious to settle the Roman question, or to cast its burden upon other shoulders than his own, Napoleon resorted to the time-worn suggestion of a European conference, a suggestion sterilized in this instance by Bismarck's desire to maintain the French occupation of Civitavecchia as a chronic source of discord between Italy and France. Foiled in this attempt, the French emperor next sought to profit by a proposal from Victor Emmanuel for a return pure and simple to the convention of September, by making such return conditional upon the conclusion of a Franco-Italian offensive and defensive alliance. Austria, already approached by Napoleon on the subject of an anti-Prussian league, had insisted that Italy should be a party to the scheme if only to preclude the renewal of the Prusso-Italian alliance of 1866. In June 1869 negotiations were opened directly between Napoleon and Victor Emmanuel, General Menabrea, in his double capacity as premier and aide-de-camp to the king, being the only Italian minister fully cognizant of the scheme. He, however, insisted that eventual war should not destroy the North German Confederation, and demanded, as a *sine quâ non*, both the recall of the French troops from Civitavecchia and permission for Italy to occupy all the papal states except Rome, and even, under certain conditions, Rome itself. The Italian demands were supported by the Austrian chancellor, Count von Beust, who, in his fervour for the alliance, declared himself ready to guarantee Italy a rectification of her frontier on the eastern Alps; but Napoleon, though at first inclined to accept the Italian conditions, gave way to the adverse influence of M. de la Vallette, who, encouraged by the empress, refused to countenance the clauses relative to Rome. Thus the projected alliance remained in abeyance until pressure of impending hostilities induced Napoleon to reopen negotiations on 16th July 1870.

Mentana.

In the meantime political conditions in Italy underwent considerable change. The Mentana episode and the prolonged French occupation of Civitavecchia profoundly irritated public feeling, while, after a crisis of unprecedented length, the Menabrea cabinet was succeeded (12th December 1869) by a strong administration, in which Giovanni Lanza, Quintino Sella, and Visconti Venosta held the chief portfolios. Sella, strong-willed and clear-headed, was heartily averse from all idea of a French alliance. Better acquainted than his sovereign or his colleagues with the respective conditions of Prussia and France, and consequently less persuaded than they of the certainty of a French victory in an eventual war, he was anxious that Italy should not be entangled by a pact which might prove ruinous, nor be compelled to incur outlay which might endanger the success of his herculean efforts to reorganize Italian finance. He was, moreover, convinced that the moment was approaching for a definitive settlement of the Roman question. When renewed in July 1870, the French proposal for an anti-Prussian league again suffered shipwreck upon the Italian demand for the withdrawal of the garrison from Civitavecchia and for permission to go to Rome. A strong despatch from Beust to the Austrian representative in Paris in support of the Italian demand irritated M. Émile Ollivier, who declared that the French garrison would "never" be withdrawn

from Civitavecchia, and on 25th July, in a letter to the emperor, characterized Beust's proposal to deliver Rome to the Italians as "pitiful and impracticable."

Relations with France. According to M. Ollivier, the only possible basis of alliance with Italy would be a return to the September convention. Without recognizing the sufficiency of such a basis, Visconti Venosta, Italian foreign minister, notified the Duc de Gramont on 29th July that Italy was prepared to execute the convention. On 5th August the French garrison evacuated Civitavecchia. Italy, convinced that France would not sanction her occupation of Rome, set about organizing with Great Britain and Austria a league of neutral Powers, after King Victor Emmanuel, by means of a special envoy, Count Vimercati, had made, on 2nd and 3rd August, a last vain attempt to induce Napoleon at Metz to agree to the Italian condition with regard to Rome. Italian neutrality was, moreover, soon imposed by the *débâcle* of the French army and by the action of the Tsar, who had warned Austria that any breach of neutrality on her part in favour of France would be followed by Russian intervention in support of Germany. Victor Emmanuel's chivalrous desire to render Napoleon a military equivalent for Magenta and Solferino, and the appeals of France for help, failed to shake the attitude of the Italian cabinet, which, apart from other considerations, knew only too well that the condition of the Italian army precluded rapid mobilization of any considerable force. Pressed by his colleague Sella and by the agitation of the Radical "party of action" for an immediate advance upon Rome, Visconti Venosta, on 29th August, addressed a circular note to the Powers, setting forth the reasons which compelled Italy to avail herself of the reserves formulated by La Marmora on 7th November 1864 in regard to the fulfilment of national aspirations.

Even if the fall of the French empire on 4th September 1870 had not released Italy *de facto et de jure* from the September convention, the Italian Government would have been compelled to occupy the papal states. Armed bands were preparing to make an onslaught upon Rome, a mutiny had broken out among the pontifical Zouaves, and in Rome itself signs of incipient revolution were apparent. Before advancing upon Rome King Victor Emmanuel sent Count Ponza di San Martino to the pope with a letter containing protestations of solicitude for the welfare of the Church, and an appeal for a peaceful occupation of Rome upon terms guaranteeing the pontiff's spiritual independence. Pius IX. indignantly rejected the proposal, and the Italian envoy, on 11th September, returned empty-handed to Florence. On the morrow the general forward movement began, Viterbo being occupied the same day, Civitavecchia on 16th September, and Rome on the morning of 20th September. Attempts made by Count von Arnim, Prussian minister to the Holy See, to promote a peaceful occupation of Rome were unavailing to shake the determination of the pope, who instructed General Kanzler, papal commander-in-chief, only to yield to force. As soon as a breach, battered in the wall near Porta Pia, had been stormed by the Italian troops, General Kanzler yielded and signed a formal capitulation. Some 200 men had been killed and wounded on both sides. On 21st September the whole of Rome was occupied except the Leonine City, the occupation being, however, extended to the Leonine City on 22nd September at the special request of the pope for reasons of public order.

The downfall of the temporal power was hailed throughout Italy with unbounded enthusiasm. Abroad, Catholic countries at first received the tidings with resignation, and Protestant countries with joy. In France, where the Government of National Defence had replaced the Empire, M. Crémieux, as president of the Government delegation at Tours, hastened to offer his congratulations to Italy; while M. Senard, French minister at Florence, wrote to Victor Emmanuel: "I desire not to lose a single instant in addressing to your Majesty, on behalf of my Government and in my own name, my sincere congratulations on this happy event."

Italian occupation of Rome. The occupation of Rome caused no surprise to the French Government, which had been forewarned on 11th September of the Italian intentions. On that occasion M. Jules Favre had recognized the September convention to be dead, and, while refusing explicitly to denounce it, had admitted that unless Italy went to Rome the city would become a prey to dangerous agitators. At the same time he made it clear that Italy would occupy Rome upon her own responsibility, though he subsequently telegraphed to M. Senard: "France cannot directly meddle in the Roman question. The temporal power has been a scourge to the world; it has fallen, and we shall not raise it again, but we feel too unfortunate to trample upon it. We shall see the Italian Government go to Rome with pleasure. It is necessary that it should go. Order and peace in Italy are at this price." Agreeably surprised by this attitude on the part of France, Visconti Venosta lost no time in conveying officially the thanks of Italy to the French Government. He doubtless foresaw that the language of MM. Favre, Crémieux, and Senard would not be endorsed by the French Clericals. Prussia, while satisfied at the fall of the temporal power, seemed to fear lest Italy might recompense the absence of French opposition to the occupation of Rome by armed intervention in favour of France. Bismarck, moreover, was indignant at the connivance of the Italian Government in the Garibaldian expedition to Dijon, and was irritated by Visconti Venosta's plea in the Italian parliament for the integrity of French territory. On 10th March 1873 Bismarck, indeed, confessed to the Prussian Herrenhaus that, towards the end of the Franco-German war, he had been disposed to make an arrangement with the Holy See detrimental to Italy. Negotiations for some such arrangement took place between him and Cardinal Ledochowski, but failed through Bismarck's fear of falling a victim to ecclesiastical duplicity. The course of events in France, however, soon calmed German apprehensions. The advent of M. Thiers, his attitude towards the petition of French bishops on behalf of the pope, the recall of M. Senard and the instructions given to his successor, the count of Choiseul, to absent himself from Italy at the moment of Victor Emmanuel's official entry into Rome (2nd July 1871), and the haste displayed in appointing a French ambassador to the Holy See, rapidly cooled the cordiality of Franco-Italian relations and reassured Bismarck on the score of any dangerous intimacy between the two Governments.

The friendly attitude of France towards Italy during the period immediately subsequent to the occupation of Rome seemed to cow and to dishearten the Vatican. For a few weeks the relations between the Curia and the Italian authorities were marked by a conciliatory spirit. The secretary-general of the Italian Foreign Office, Baron Blanc, who had accompanied General Cadorna to Rome, was received almost daily by Cardinal Antonelli, papal secretary of state, in order to settle innumerable questions arising out of the Italian occupation.

Attitude of the Vatican. The royal commissioner for finance, Signor Giacomelli, had, as a precautionary measure, seized the pontifical treasury; but upon being informed by Cardinal Antonelli that among the funds deposited

in the treasury were 1,000,000 crowns of Peter's Pence offered by the faithful to the pope in person, the commissioner was authorized by the Italian council of state not only to restore this sum, but also to indemnify the Holy See for moneys expended for the service of the October coupon of the pontifical debt, that debt having been taken over by the Italian state. On 29th September Cardinal Antonelli further apprised Baron Blanc that he was about to issue drafts for the monthly payment of the 50,000 crowns inscribed in the pontifical budget for the maintenance of the pope, the Sacred College, the apostolic palaces, and the papal guards. The Italian treasury at once honoured all the papal drafts, and thus contributed a first instalment of the 3,225,000 lire per annum afterwards placed by Article 4 of the Law of Guarantees at the disposal of the Holy See. Payments would have been regularly continued had not pressure from the French Clerical party coerced the Vatican into refusing any further instalment.

Once in possession of Rome, and guarantor to the Catholic world of the spiritual independence of the pope, the Italian Government prepared juridically to regulate its relations to the Holy See. A Bill known as the Law of Guarantees was therefore framed and laid before parliament. The measure was an amalgam of Cavour's scheme for a "free Church in a free State," of Ricasoli's Free Church Bill, rejected by parliament four years previously, and of the proposals presented to Pius IX. by Count Ponza di San Martino in September 1870. After a debate lasting nearly two months the Law of Guarantees was adopted in secret ballot on 21st March 1871 by 185 votes against 106. It consisted of two parts. The first, containing thirteen Articles, recognized (Articles 1 and 2) the person of the pontiff as sacred and intangible, and while providing for free discussion of religious questions, punished insults and outrages against the pope in the same way as insults and outrages against the king. Royal honours were attributed to the pope (Article 3), who was further guaranteed the same precedence as that accorded to him by other Catholic sovereigns, and the right to maintain his Noble and Swiss guards. Article 4 allotted the pontiff an annuity of 3,225,000 lire (£129,000) for the maintenance of the Sacred College, the sacred palaces, the congregations, the Vatican chancery, and the diplomatic service. The sacred palaces, museums, and libraries were, by Article 5, exempted from all taxation, and the pope was assured perpetual enjoyment of the Vatican and Lateran buildings and gardens, and of the papal villa at Castel Gandolfo. Articles 6 and 7 forbade access of any Italian official or agent to the above-mentioned palaces or to any eventual conclave or œcumenical council without special authorization from the pope, conclave, or council. Article 8 prohibited the seizure or examination of any ecclesiastical papers, documents, books, or registers of purely spiritual character. Article 9 guaranteed to the pope full freedom for the exercise of his spiritual ministry, and provided for the publication of pontifical announcements on the doors of the Roman churches and basilicas. Article 10 extended immunity to ecclesiastics employed by the Holy See, and bestowed upon foreign ecclesiastics in Rome the rights of Italian citizens. By Article 11, diplomatists accredited to the Holy See, and papal diplomatists while in Italy, were placed on the same footing as diplomatists accredited to the Quirinal. Article 12 provided for the transmission free of cost in Italy of all papal telegrams and correspondence both with bishops and foreign governments, and sanctioned the establishment, at the expense of the Italian state, of a papal telegraph office served by papal officials in communication with the Italian postal and telegraph system. Article 13 exempted all ecclesiastical seminaries, academies, colleges, and schools for the education of priests in the city of Rome, from all interference on the part of the Italian Government.

The Law of Guarantees.

This portion of the law, designed to reassure foreign Catholics, met with little opposition; but the second portion, regulating the relations between State and Church in Italy, was sharply criticized by deputies who, like Sella, recognized the ideal of a "free Church in a free State" to be an impracticable dream. The second division of the law abolished (Article 14) all restrictions upon the right of meeting of members of the clergy. By Article 15 the Government relinquished its rights to apostolic legation in Sicily, and to the appointment of its own nominees to the chief benefices throughout the kingdom. Bishops were further dispensed from swearing fealty to the king, though, except in Rome and suburbs, the choice of bishops was limited to ecclesiastics of Italian nationality. Article 16 abolished the need for royal *exequatur* and *placet* for ecclesiastical publications, but subordinated the enjoyment of temporalities by bishops and priests to the concession of state *exequatur* and *placet*. Article 17 maintained the independence of the ecclesiastical jurisdiction in spiritual and disciplinary matters, but reserved for the state the exclusive right to carry out coercive measures. On 12th July 1871, Articles 268, 269, and 270 of the Italian Penal Code were so modified as to make ecclesiastics liable to imprisonment for periods varying from six months to five years, and to fines from 1000 to 3000 lire, for spoken or written attacks against the laws of the state, or for the fomentation of disorder. An encyclical of Pius IX. to the bishops of the Catholic Church on 15th May 1871 repudiated the Law of Guarantees, and summoned Catholic princes to co-operate in restoring the temporal power. Practically, therefore, the law has remained a one-sided enactment, by which Italy considers herself bound, and of which she has always observed the spirit, even though the exigencies of self-defence may have led in some minor respects to non-observance of the letter. The annuity payable to the pope has, for instance, been made subject to quinquennial prescription, so that in the event of tardy recognition of the law the Vatican could at no time claim payment of more than five years' annuity with interest.

For a few months after the occupation of Rome pressing questions incidental to a new change of capital and to the administration of a new domain distracted public attention from the real condition of Italian affairs. The rise of the Tiber and the flooding of Rome in December 1870 (tactfully used by Victor Emmanuel as an opportunity for a first visit to the new capital) illustrated the imperative necessity of reorganizing the drainage of the city and of constructing the Tiber embankment. In spite of pressure from the French Government, which desired Italy to maintain Florence as the political and to regard Rome merely as the moral capital of the realm, the Government offices and both legislative chambers were transferred in 1871 to the Eternal City. Early in the year the Crown Prince Humbert with the Princess Margherita took up their residence in the Quirinal Palace, which, in view of the Vatican refusal to deliver up the keys, had to be opened by force. Eight monasteries were expropriated to make room for the chief state departments, pending the construction of more suitable edifices. The growth of Clerical influence in France engendered a belief that Italy would soon have to defend with the sword her newly-won unity, while the tremendous lesson of the Franco-Prussian war convinced the military authorities of the need for thorough military reform. General

Ricotti, minister of war, therefore framed an Army Reform Bill designed to bring the Italian army as nearly as possible up to the Prussian standard. Sella, minister of finance, notwithstanding the sorry plight of the Italian exchequer, readily granted the means for the reform. "We must arm," he said, "since we have overturned the papal throne," and he pointed to France as the quarter from which attack was most likely to come.

Though perhaps less desperate than during the previous decade, the condition of Italian finance was precarious indeed. With taxation screwed up to breaking point on personal and real estate, on all forms of commercial and industrial activity, and on salt, flour, and other necessaries of life; with a deficit of £8,500,000 for the current year, and the prospect of a further aggregate deficit of £12,000,000 during the next quinquennium, Sella's heroic struggle against national bankruptcy was still far from a successful termination. He chiefly had borne the brunt and won the laurels of the unprecedented fight against deficit in which Italy had been involved since 1862. As finance minister in the Rattazzi cabinet of that year he had been confronted with a public debt of nearly £120,000,000, and with an immediate deficit of nearly £18,000,000. In 1864, as minister in the La Marmora cabinet, he had again to face an excess of expenditure over income amounting to more than £14,600,000. By the seizure and sale of Church lands, by the sale of state railways, by "economy to the bone," and on one supreme occasion by an appeal to taxpayers to advance a year's quota of the land-tax, he had met the most pressing engagements of that troublous period. The king was persuaded to forego one-fifth of his civil list, ministers and the higher civil servants were required to relinquish a portion of their meagre salaries, but, in spite of all, Sella had found himself in 1865 compelled to propose the most hated of fiscal burdens—a grist tax on cereals. This tax (*macinato*) had long been known in Italy. Vexatious methods of assessment and collection had made it so unpopular that the Italian Government in 1859–60 had thought it expedient to abolish it throughout the realm. Sella hoped by the application of a mechanical meter both to obviate the odium attaching to former methods of collection and to avoid the maintenance of an army of inspectors and tax-gatherers, whose stipends had formerly eaten up most of the proceeds of the impost. Before proposing the reintroduction of the tax, Sella and his friend Ferrara improved and made exhaustive experiments with the meter. The result of their efforts was laid before parliament in one of the most monumental and most painstaking preambles ever prefixed to a Bill. Sella, nevertheless, fell before the storm of opposition which his scheme aroused. Scialoja, who succeeded him, was obliged to adopt a similar proposal, but parliament again proved refractory. Ferrara, successor of Scialoja, met a like fate; but Count Cambray-Digny, finance minister in the Menabrea cabinet of 1868–69, driven to find means to cover a deficit aggravated by the interest on the Venetian debt, succeeded, with Sella's help, in forcing a Grist Tax Bill through parliament, though in a form of which Sella could not entirely approve. When, on 1st January 1869, the new tax came into force, nearly half the flour-mills in Italy ceased work. In many districts the Government was obliged to open mills on its own account. Inspectors and tax-gatherers did their work under police protection, and in several parts of the country riots had to be suppressed *manu militari*. At first the net revenue from the impost was less than £1,100,000; but under Sella's firm administration (1869–73), and in consequence of improvements gradually introduced by him, the net return ultimately exceeded £3,200,000. The parliamentary opposition to the impost, which the Left denounced as "the tax on hunger," was largely factitious. Few, except the open partisans of national bankruptcy, doubted its necessity; yet so strong was the current of feeling worked up for party purposes by opponents of the measure, that Sella's achievement in having by its means saved the financial situation of Italy deserves to rank among the most noteworthy performances of modern parliamentary statesmanship.

Finance.

Under the stress of the appalling financial conditions, represented by chronic deficit, crushing taxation, the heavy expenditure necessary for the consolidation of the kingdom, the reform of the army, and the interest on the pontifical debt, Sella, on 11th December 1871, exposed to parliament the financial situation in all its nakedness. He recognized that considerable improvement had already taken place. Revenue from taxation had risen in a decade from £7,000,000 to £20,200,000; profit on state monopolies had increased from £7,000,000 to £9,400,000; exports had grown to exceed imports; income from the working of telegraphs had tripled itself; railways had been extended from 2200 to 6200 kilometres, and the annual travelling public had augmented from 15,000,000 to 25,000,000 persons. The serious feature of the situation lay less in the income than in the "intangible" expenditure, namely, the vast sums required for interest on the various forms of public debt and for pensions. Within ten years this category of outlay had increased from £8,000,000 to £28,800,000. During the same period the assumption of the Venetian and Roman debts, losses on the issue of loans, and the accumulation of annual deficits, had caused public indebtedness to rise from £92,000,000 to £328,000,000, no less than £100,000,000 of the latter sum having been sacrificed in premiums and commissions to bankers and underwriters of loans. By economies and new taxes Sella had reduced the deficit to less than £2,000,000 in 1871, but for 1872 he found himself confronted with a total expenditure £8,000,000 in excess of revenue. He therefore proposed to make over the treasury service to the state banks, to increase the forced currency, to raise the stamp and registration duties, and to impose a new tax on textile fabrics. An optional conversion of sundry internal loans into consolidated stock at a lower rate of interest was calculated to effect considerable saving. The battle over these proposals was long and fierce. But for the tactics of Rattazzi, leader of the Left, who, by basing his opposition on party considerations, impeded the secession of Minghetti and a part of the Right from the ministerial majority, Sella would have been defeated. On 23rd March 1872, however, he succeeded in carrying his programme, which not only provided for the pressing needs of the moment, but laid the foundation of the much-needed equilibrium between expenditure and revenue.

In the spring of 1873 it became evident that the days of the Lanza–Sella cabinet were numbered. Fear of the advent of a Radical administration under Rattazzi alone prevented the Minghettian Right from revolting against the Government. The Left, conscious of its strength, impatiently awaited the moment of accession to power. Sella, the real head of the Lanza cabinet, was worn out by four years' continuous work, and disheartened by the perfidious misrepresentation in which Italian politicians, particularly those of the Left, have ever excelled. By sheer force of will he compelled the Chamber early in 1873 to adopt some minor financial reforms, but, on 29th April, found himself in a minority on the question

of a credit for a proposed state arsenal at Taranto. Pressure from all sides of the House, however, induced the ministry to retain office until after the debate on the application to Rome and the Papal States of the Religious Orders Bill (originally passed in 1866)—a measure which, with the help of Ricasoli, was carried at the end of May. While leaving intact the general houses of the various confraternities (except that of the Jesuits), the Bill abolished the corporate personality of religious orders, handed over their schools and hospitals to civil administrators, placed their churches at the disposal of the secular clergy, and provided pensions for nuns and monks, those who had families being sent to reside with their relatives, and those who by reason of age or bereavement had no home but their monasteries being allowed to end their days in religious houses specially set apart for the purpose. The proceeds of the sale of the suppressed convents and monasteries were partly converted into pensions for monks and nuns, and partly allotted to the municipal charity boards which had undertaken the educational and charitable functions formerly exercised by the religious orders. To the pope was made over £16,000 per annum as a contribution to the expense of maintaining in Rome representatives of foreign orders; the Sacred College, however, rejected this endowment, and summoned all the suppressed confraternities to reconstitute themselves under the ordinary Italian law of association. A few days after the passage of the Religious Orders Bill, the death of Rattazzi (5th June 1873) removed all probability of the immediate advent of the Left. Sella, uncertain of the loyalty of the Right, challenged a vote on the immediate discussion of further financial reforms, and on 23rd June was overthrown by a coalition of the Left under Depretis with a part of the Right under Minghetti and the Tuscan Centre under Correnti. The Administration which thus fell was unquestionably the most important since the death of Cavour. It had completed national unity, transferred the capital to Rome, overcome the chief obstacles to financial equilibrium, initiated military reform, and laid the foundation of the relations between State and Church.

Religious Orders Bill.

The succeeding Minghetti–Visconti Venosta cabinet—which held office from 10th July 1873 to 18th March 1876—continued in essential points the work of the preceding Administration. Minghetti's finance, though less clear-sighted and less resolute than that of Sella, was on the whole prudent and beneficial. With the aid of Sella he concluded conventions for the redemption of the chief Italian railways from their French and Austrian proprietors. By dint of expedients he gradually overcame the chronic deficit, and, owing to the normal increase of revenue, ended his term of office with the announcement of a surplus of some £720,000. The question whether this surplus was real or only apparent has been much debated, but there is no reason to doubt its substantial reality. It left out of account a sum of £1,000,000 for railway construction which was covered by credit, but, on the other hand, took no note of £360,000 expended in the redemption of debt. Practically, therefore, the Right, of which the Minghetti cabinet was the last representative administration, left Italian finance with a surplus of £80,000. Outside the all-important domain of finance, the attention of Minghetti and his colleagues was principally absorbed by strife between Church and State, army reform, and railway redemption. For some time after the occupation of Rome the pope, in order to substantiate the pretence that his spiritual freedom had been diminished, avoided the creation of cardinals and the nomination of bishops. On 22nd December 1873, however, he unexpectedly created twelve cardinals, and subsequently proceeded to nominate a number of bishops. Visconti Venosta, who had retained the portfolio for foreign affairs in the Minghetti cabinet, at once drew the attention of the European Powers to this proof of the pope's spiritual freedom and of the imaginary nature of his "imprisonment" in the Vatican. At the same time he assured them that absolute liberty would be guaranteed to the deliberations of a conclave. In relation to the Church in Italy, Minghetti's policy was less perspicacious. He let it be understood that the announcement of the appointment of bishops and the request for the royal *exequatur* might be made to the Government impersonally by the congregation of bishops and regulars, by a municipal council or by any other corporate body—a concession of which the bishops were quick to take advantage, but which so irritated Italian political opinion that, in July 1875, the Government was compelled to withdraw the temporalities of ecclesiastics who had neglected to apply for the *exequatur*, and to evict sundry bishops who had taken possession of their palaces without authorization from the state. Parliamentary pressure further obliged Bonghi, minister of public instruction, to compel clerical seminaries either to forego the instruction of lay pupils or to conform to the laws of the state in regard to inspection and examination, an ordinance which gave rise to conflicts between ecclesiastical and lay authorities, and led to the forcible dissolution of the Mantua seminary and to the suppression of the Catholic university in Rome.

Minghetti.

More noteworthy than its management of internal affairs were the efforts of the Minghetti cabinet to strengthen and consolidate national defence. Appalled by the weakness or, rather, the non-existence of the navy, Admiral Saint-Bon, with his coadjutor, Signor Brin, addressed himself earnestly to the task of recreating the fleet, which had never recovered from the effects of the disaster of Lissa. During his three years of office he laid the foundation upon which Brin was afterwards to build up a new Italian navy. Simultaneously General Ricotti matured the army reform scheme which he had elaborated under the preceding Administration. His Bill, adopted by parliament on 7th June 1875, still forms the ground plan of the Italian army. Besides providing for an extensive system of fortification and territorial defence, it fixed the period of military liability for able-bodied men at nineteen years, beginning on the completion of the twentieth and ending with the thirty-ninth year of their age. Recruits were divided into three categories. Infantry, artillery, and engineer recruits of the first category were made liable to serve from two to three years with the colours, cavalry recruits four years, and carabineer recruits five. After discharge from active service, men belonging to the infantry, artillery, and engineers pass into the standing army reserve until completion of their twenty-eighth year, and cavalrymen and carabineers until completion of their twenty-ninth year. From the beginning of their twenty-ninth to the end of their thirty-second year first-category men of the infantry, artillery, and engineers are placed in the *milizia mobile* (a formation corresponding to the first levy of the German *Landwehr*), and for the last seven years of their military liability pass into the territorial or local militia (approximately equivalent to the second levy of the *Landwehr*). First-category cavalrymen and carabineers, after completing their twenty-ninth year, are placed immediately in the territorial militia, since the *milizia mobile* possesses no cavalry or carabineer cadres. The second category

Military and naval reform.

consists of supernumerary recruits for whom no place exists in the standing army. These belong for eight years to the standing army reserve, whence they pass for four years into the *milizia mobile*, and finally for seven years into the territorial militia. The third category is made up of men legally exempt from military service with the colours (*i.e.*, only sons, eldest sons of widows, eldest brothers of families of orphans, brothers of soldiers killed or wounded on active service, &c.), who belong for nineteen years to the territorial militia. This category represents at least 30 per cent. of the total annual levy. Voluntary, or one year's service with the colours, is admitted in the case of those who have successfully completed five years' instruction in the elementary schools and who pay the War Office a sum varying from £48 to £64, according to the arm in which they serve. The number of recruits annually incorporated in the active army is fixed every year by parliament on proposal of the war minister. At the time of the application of the Ricotti law, the annual levy was approximately 65,000, but has since grown to exceed 95,000. Theoretically, the army now comprises 784,424 men, including 14,414 officers and 216,723 men in active service and 6294 officers and 546,771 men of the standing army reserve. The *milizia mobile* consists approximately of 500,000 officers and men, and the territorial or local militia approximately of 2,100,000 officers and men. Considerations of economy, however, preclude the effectual training of anything like these totals. The outlay necessitated by the adoption of the Ricotti Bill amounted to £6,600,000 ordinary and £800,000 extraordinary expenditure per annum, a total which has by degrees been increased to and consolidated at the present level of £9,560,000.

Foreign policy under the Right.

It may be accounted as a piece of rare fortune for Italy that during the whole period 1869–76 the direction of her foreign policy remained in the experienced hands of Visconti Venosta, a statesman whose trustworthiness, dignity, and moderation even political opponents have been compelled to recognize. Diplomatic records fail to substantiate the accusations of lack of initiative and instability of political criterion currently brought against him by contemporaries. As foreign minister of a young state which had attained unity in defiance of the most formidable religious organization in the world and in opposition to the traditional policy of France, it could but be Visconti Venosta's aim to uphold the dignity of his country while convincing European diplomacy that United Italy was an element of order and progress, and that the spiritual independence of the Roman pontiff had suffered no diminution. Prudence, moreover, counselled avoidance of all action likely to serve the predominant anti-Italian party in France as a pretext for violent intervention in favour of the pope. On the occasion of the Metrical Congress, which met in Paris in 1872, he, however, successfully protested against the recognition of the Vatican delegate, Father Secchi, as a representative of a "state," and obtained from Count de Rémusat, French foreign minister, a formal declaration that the presence of Father Secchi on that occasion could not constitute a diplomatic precedent. The irritation displayed by Bismarck at the Francophil attitude of Italy towards the end of the Franco-German war gave place to a certain show of goodwill when the great chancellor found himself in his turn involved in a struggle against the Vatican and when the policy of M. Thiers began to strain Franco-Italian relations. M. Thiers had consistently opposed the Emperor Napoleon's pro-Italian policy. In the case of Italy, as in that of Germany, he frankly regretted the constitution of powerful homogeneous states upon the borders of France. Personal pique accentuated this feeling in regard to Italy. The refusal of Victor Emmanuel II. to meet M. Thiers at the opening of the Mont Cenis tunnel (a refusal not unconnected with offensive language employed at Florence in October 1870 by M. Thiers during his European tour, and with his instructions to the French minister to remain absent from Victor Emmanuel's official entry into Rome) had wounded the *amour propre* of the French statesman, and had decreased whatever inclination he might otherwise have felt to oppose the French Clerical agitation for the restoration of the temporal power, and for French interference with the Italian Religious Orders Bill. Consequently relations between France and Italy became so strained that in 1873 both the French minister to the Quirinal and the Italian minister to the Republic remained for several months absent from their posts. At this juncture the emperor of Austria invited Victor Emmanuel to visit the Vienna Exhibition, and the Italian Government received a confidential intimation that acceptance of the invitation to Vienna would be followed by a further invitation from Berlin. Perceiving the advantage of a visit to the imperial and apostolic court after the Italian occupation of Rome and the suppression of the religious orders, and convinced of the value of more cordial intercourse with the German empire, Visconti Venosta and Minghetti advised their sovereign to accept both the Austrian and the subsequent German invitations. The visit to Vienna took place on 17th to 22nd September, and that to Berlin on 22nd to 26th September 1873, the Italian monarch being accorded in both capitals a most cordial reception, although the contemporaneous publication of La Marmora's famous pamphlet, *More Light on the Events of 1866*, prevented intercourse between the Italian ministers and Bismarck from being entirely confidential. Visconti Venosta and Minghetti, moreover, wisely resisted the chancellor's pressure to override the Law of Guarantees and to engage in an Italian *Kulturkampf*. Nevertheless the royal journey contributed notably to the establishment of cordial relations between Italy and the central Powers, relations which were further strengthened by the visit of the Emperor Francis Joseph to Victor Emmanuel at Venice in April 1875, and by that of the German emperor to Milan in October of the same year. Meanwhile M. Thiers had given place to Marshal MacMahon, who effected a decided improvement in Franco-Italian relations by recalling from Civitavecchia the cruiser *Orénoque*, which since 1870 had been stationed in that port at the disposal of the pope in case he should desire to quit Rome. The foreign policy of Visconti Venosta may be said to have reinforced the international position of Italy without sacrifice of dignity, and without the vacillation and short-sightedness which was to characterize the ensuing administrations of the Left.

The fall of the Right on 18th March 1876 was an event destined profoundly and in many respects adversely to affect the course of Italian history. Theoretically, it may be argued that the advent of the new men, and the ultra-democratic ideas associated with the historic Left, was not only inevitable, but beneficial, since the concentration of power for a long period in the hands of the representatives of any one class or region of a country could not fail to be detrimental; practically, however, it is essential that new men should equal those whom they replace in personal integrity and aptitude for government. Except at rare and not auspicious intervals, the Right had held office from 1849 to 1876. Its rule was associated in the popular mind with severe administration; hostility to the democratic elements represented by Garibaldi, Crispi,

Depretis, and Bertani; ruthless imposition and collection of taxes in order to meet the financial engagements forced upon Italy by the vicissitudes of her Risorgimento; strong predilection for Piedmontese, Lombards, and Tuscans, and a steady determination, not always scrupulous in its choice of means, to retain executive power and the most important administrative offices of the state for the *consorteria*, or close corporation, of its own adherents. For years the men of the Left had worked to inoculate the electorate with suspicion of Conservative methods and with hatred of the imposts which they nevertheless knew to be indispensable to sound finance. In regard to the grist tax especially, the agitators of the Left had placed their party in a radically false position. Moreover, the redemption of the railways by the state—contracts for which had been signed by Sella in 1875 on behalf of the Minghetti cabinet with Rothschild at Basel and with the Austrian Government at Vienna—had been fiercely opposed by the Left, although its members were for the most part convinced of the utility of the operation. When, at the beginning of March 1876, these contracts were submitted to parliament, a group of Tuscan deputies, under Cesare Correnti, joined the opposition, and on 18th March took advantage of a chance motion concerning the date of discussion of an interpellation on the grist tax to place the Minghetti cabinet in a minority. Depretis, ex-pro-dictator of Sicily, and successor of Rattazzi in the leadership of the Left, was entrusted by the king with the formation of a Liberal ministry.

First Depretis Cabinet.

Besides the premiership, Depretis assumed the portfolio of finance; Nicotera, an ex-Garibaldian of somewhat tarnished reputation, but a man of energetic and conservative temperament, was placed at the ministry of the interior; public works were entrusted to Zanardelli, a Radical doctrinaire of considerable juridical attainments; General Mezzacapo and Signor Brin replaced General Ricotti and Admiral Saint-Bon at the War Office and Ministry of Marine; while to Mancini and Coppino, prominent members of the Left, were allotted the portfolios of justice and public instruction. Great difficulty was experienced in finding a foreign minister willing to challenge comparison with Visconti Venosta. Several diplomatists in active service were approached, but, partly on account of their refusal, and partly from the desire of the Left to avoid giving so important a post to a diplomatist bound by ties of friendship or of interest to the Right, the choice fell upon Melegari, Italian minister at Bern.

The new ministers had long since made monarchical professions of faith, but, up to the moment of taking office, were nevertheless considered to be tinged with an almost revolutionary hue. The king alone appeared to feel no misgiving. His shrewd sense of political expediency and his loyalty to constitutional principles saved him from the error of obstructing the advent and driving into an anti-dynastic attitude politicians who had succeeded in winning popular favour. Indeed, the patriotism and loyalty of the new ministers were above suspicion. Danger lay rather in entrusting men schooled in political conspiracy and in unscrupulous parliamentary opposition with the government of a young state still beset by enemies at home and abroad. As an opposition party the Left had lived upon the facile credit of political promises, but had no well-considered programme nor other discipline nor unity of purpose than that born of the common eagerness of its leaders for office and their common hostility to the Right. Neither Depretis, Nicotera, Crispi, Cairoli, nor Zanardelli was disposed permanently to recognize the superiority of any one chief. The dissensions which broke out among them within a few months of the accession of their party to power never afterwards disappeared, except at rare moments when it became necessary to unite in preventing the return of the Conservatives. Considerations such as these could not be expected to appeal to the nation at large, which hailed the advent of the Left as the dawn of an era of unlimited popular sovereignty, diminished administrative pressure, reduction of taxation, and general prosperity. The programme of Depretis corresponded only in part to these expectations. Its chief points were extension of the franchise, incompatibility of a parliamentary mandate with an official position, strict enforcement of the rights of the State in regard to the Church, protection of freedom of conscience, maintenance of the military and naval policy inaugurated by the Conservatives, acceptance of the railway redemption contracts, consolidation of the financial equilibrium, abolition of the forced currency, and, eventually, fiscal reform. The long-promised abolition of the grist tax was not explicitly mentioned, opposition to the railway redemption contracts was transformed into approval, and the vaunted reduction of taxation replaced by lip-service to the Conservative deity of financial equilibrium. The railway redemption contracts were in fact immediately voted by Parliament, with a clause pledging the Government to legislate in favour of farming out the railways to private companies.

Programme of the Left.

Nicotera, minister of the interior, began his administration of home affairs by a sweeping change in the *personnel* of the prefects, sub-prefects, and public prosecutors, but found himself obliged to incur the wrath of his supporters by prohibiting Radical meetings likely to endanger public order, and by enunciating administrative principles which would have befitted an inveterate Conservative. In regard to the Church, he instructed the prefects strictly to prevent infraction of the law against religious orders. At the same time the cabinet, as a whole, brought in a Clerical Abuses Bill, threatening with severe punishment priests guilty of disturbing the peace of families, of opposing the laws of the state, or of fomenting disorder. Depretis, for his part, was compelled to declare impracticable the immediate abolition of the grist tax, and to frame a Bill for the increase of revenue, acts which caused the secession of some sixty Radicals and Republicans from the ministerial majority, and gave the signal for an agitation against the premier similar to that which he himself had formerly undertaken against the Right. The first general election under the Left (November 1876) had yielded the cabinet the overwhelming majority of 421 Ministerialists against 87 Conservatives, but the very size of the majority rendered it unmanageable. The Clerical Abuses Bill provoked further dissensions: Nicotera was severely affected by revelations concerning his political past; Zanardelli refused to sanction the construction of a railway in Calabria in which Nicotera was interested; and Depretis saw fit to compensate the supporters of his Bill for the increase of revenue by decorating at one stroke sixty ministerial deputies with the Order of the Crown of Italy. A further derogation from the ideal of democratic austerity was committed by adding £80,000 per annum to the king's civil list (14th May 1877) and by burdening the state exchequer with royal household pensions amounting to £20,000 a year. The civil list, which the law of 10th August 1862 had fixed at £650,000 a year, but which had been voluntarily reduced by the king to £530,000 in 1864, and to £490,000 in 1867, was thus raised to £570,000 a year. Almost the only respect in which the Left could boast a decided improvement over the administration of the Right was the energy displayed by Nicotera in combating brigandage and the maffia in Calabria and Sicily. Successes achieved in

those provinces failed, however, to save Nicotera from the wrath of the Chamber, and on 14th December 1877 a cabinet crisis arose over a question concerning the secrecy of telegraphic correspondence. Depretis thereupon reconstructed his administration, excluding Nicotera, Melegari, and Zanardelli, placing Crispi at the home office, entrusting Magliani with finance, and himself assuming the direction of foreign affairs.

In regard to foreign affairs, the *début* of the Left as a governing party was scarcely more satisfactory than its home policy. Since the war of 1866 the Left had advocated an Italo-Prussian alliance in opposition to the Francophil tendencies of the Right. On more than one occasion Bismarck had maintained direct relations with the chiefs of the Left, and had in 1870 worked to prevent a Franco-Italian alliance by encouraging the "party of action" to press for the occupation of Rome. Besides, the Left stood for anticlericalism and for the retention by the State of means of coercing the Church, in opposition to the men of the Right, who, with the exception of Sella, favoured Cavour's ideal of "a free Church in a free State," and the consequent abandonment of state control over ecclesiastical government. Upon the outbreak of the Prussian *Kulturkampf* the Left had pressed the Right to introduce an Italian counterpart to the Prussian May laws, especially as the attitude of Thiers and the hostility of the French Clericals obviated the need for sparing French susceptibilities. Visconti Venosta and Minghetti, partly from aversion to a Jacobin policy, and partly from a conviction that Bismark sooner or later would undertake his *Gang nach Canossa*, regardless of any tacit engagement he might have assumed towards Italy, had wisely declined to be drawn into any infraction of the Law of Guarantees. It was, however, expected that the chiefs of the Left, upon attaining office, would turn resolutely towards Prussia in search of a guarantee against the Clerical menace embodied in the *régime* of Marshal Macmahon. On the contrary, Depretis and Melegari, both of whom were imbued with French Liberal doctrines, adopted towards the Republic an attitude so deferential as to arouse suspicion in Vienna and Berlin. Depretis recalled Nigra from Paris and replaced him by General Cialdini, whose ardent plea for Italian intervention in favour of France in 1870, and whose comradeship with Marshal Macmahon in 1859, would, it was supposed, render him *persona gratissima* to the French Government. This calculation was falsified by events. Incensed by the elevation to the rank of embassies of the Italian legation in Paris and the French legation to the Quirinal, and by the introduction of the Italian Bill against clerical abuses, the French Clerical party not only attacked Italy and her representative, General Cialdini, in the Chamber of Deputies, but promoted a monster petition against the Italian Bill. Even the *coup d'État* of 16th May 1877 (when Macmahon dismissed the Jules Simon cabinet for opposing the Clerical petition) hardly availed to change the attitude of Depretis. As a precaution against an eventual French attempt to restore the temporal power, orders were hurriedly given to complete the defences of Rome, but in other respects the Italian Government maintained its subservient attitude. Yet at that moment the adoption of a clear line of policy, in accord with the central Powers, might have saved Italy from the loss of prestige entailed by her bearing in regard to the Russo-Turkish war and the Austrian acquisition of Bosnia, and might have prevented the disappointment subsequently occasioned by the outcome of the Congress of Berlin. In the hope of inducing the European Powers to "compensate" Italy for the increase of Austrian influence on the Adriatic, Crispi undertook in the autumn of 1877, with the approval of the king, and in spite of the half-disguised opposition of Depretis, a semi-official mission to Paris, Berlin, London, and Vienna. The mission appears not to have been an unqualified success, though Crispi afterwards affirmed in the Chamber (4th March 1886) that Depretis might in 1877 "have harnessed fortune to the Italian chariot." Depretis, anxious only to avoid "a policy of adventure," let slip whatever opportunity may have presented itself, and neglected even to deal energetically with the impotent but mischievous Italian agitation for a "rectification" of the Italo-Austrian frontier. He greeted the treaty of San Stefano (3rd March 1878) with undisguised relief, and, by the mouth of the king, congratulated Italy (7th March 1878) on having maintained with the Powers friendly and cordial relations "free from suspicious precautions," and upon having secured for herself "that most precious of alliances, the alliance of the future"—a phrase of which the empty rhetoric was to be bitterly demonstrated by the Berlin Congress and the French occupation of Tunis.

Foreign policy of the Left.

The entry of Crispi into the Depretis cabinet (December 1877) placed at the ministry of the interior a strong hand and sure eye at a moment when they were about to become imperatively necessary. Crispi was the only man of truly statesmanlike calibre in the ranks of the Left. Formerly a friend and disciple of Mazzini, with whom he had broken on the question of the monarchical form of government which Crispi believed indispensable to the unification of Italy, he had afterwards been one of Garibaldi's most efficient coadjutors and an active member of the "party of action." Passionate, not always scrupulous in his choice and use of political weapons, intensely patriotic, loyal with a loyalty based rather on reason than sentiment, quick-witted, prompt in action, determined and pertinacious, he possessed in eminent degree many qualities lacking in other Liberal chieftains. Hardly had he assumed office when the unexpected death of Victor Emmanuel II. (9th January 1878) stirred national feeling to an unprecedented depth and placed the continuity of monarchical institutions in Italy upon trial before Europe. For thirty years Victor Emmanuel had been the centre point of national hopes, the token and embodiment of the struggle for national redemption. He had led the country out of the despondency which followed the defeat of Novara and the abdication of Charles Albert, through all the vicissitudes of national unification to the final triumph at Rome. His disappearance snapped the chief link with the heroic period and removed from the helm of state a ruler of large heart, great experience, and civil courage, at a moment when elements of continuity were needed and vital problems of internal reorganization had still to be faced. Crispi adopted the measures necessary to ensure the tranquil accession of King Humbert with a quick energy which precluded any Radical or Republican demonstrations. His influence decided the choice of the Roman Pantheon as the late monarch's burial-place, in spite of formidable pressure from the Piedmontese, who wished Victor Emmanuel II. to rest with the Sardinian kings at Superga. He also persuaded the new ruler to inaugurate, as King Humbert I., the new dynastical epoch of the kings of Italy, instead of continuing as Humbert IV. the succession of the kings of Sardinia. Before the commotion caused by the death of Victor Emmanuel had passed away, the decease of Pius IX. (7th February 1878) placed further demands upon Crispi's sagacity and promptitude. Like Victor Emmanuel, Pius IX. had been bound up with the history of the Risorgimento, but, unlike him, had

Crispi.

Deaths of Victor Emmanuel II. and Pius IX.

represented and embodied the anti-national, reactionary spirit. Having once let slip the opportunity which presented itself in 1846–48, of placing the papacy at the head of the unitary movement, he had seen himself driven from Rome, despoiled piecemeal of papal territory, reduced to an attitude of perpetual protest, and finally confined, voluntarily, but still confined, within the walls of the Vatican. Ecclesiastically, he had become the instrument of the triumph of Jesuit influence, and had in turn set his seal upon the dogma of the Immaculate Conception, the Syllabus, and Papal Infallibility. Yet, in spite of all, his jovial disposition and good-humoured cynicism saved him from unpopularity, and rendered his death an occasion of mourning. Notwithstanding the pontiff's bestowal of the apostolic benediction *in articulo mortis* upon Victor Emmanuel, the attitude of the Vatican had remained so inimical as to make it doubtful whether the conclave would be held in Rome. Crispi, whose strong anti-clerical convictions did not prevent him from regarding the papacy as pre-eminently an Italian institution, was determined both to prove to the Catholic world the practical independence of the government of the Church and to retain for Rome so potent a centre of universal attraction as the presence of the future pope. The Sacred College of cardinals having decided to hold the conclave abroad, Crispi assured them of absolute freedom if they remained in Rome, or of protection to the frontier should they migrate, but warned them that, once evacuated, the Vatican would be occupied in the name of the Italian Government and be lost to the Church as headquarters of the papacy. The cardinals thereupon overruled their former decision, and the conclave was held in Rome, the new pope, Cardinal Pecci, being elected on 20th February 1878 without let or hindrance. The Italian Government not only prorogued the Chamber during the conclave to prevent unseemly inquiries or demonstrations on the part of deputies, but by means of Mancini, minister of justice, and Cardinal di Pietro, assured the new pope protection during the settlement of his outstanding personal affairs, an assurance of which Leo XIII., on the evening after his election, took full advantage. At the same time the duke of Aosta, commander of the Rome army corps, ordered the troops to render royal honours to the pontiff should be officially appear in the capital. King Humbert addressed to the pope a letter of congratulation upon his election, and received a courteous reply. The improvement thus signalized in the relations between Quirinal and Vatican was further exemplified on 18th October 1878, when the Italian Government accepted a papal formula with regard to the granting of the royal *exequatur* for bishops, whereby they, upon nomination by the Holy See, recognized state control over, and made application for, the payment of their temporalities.

Leo XIII.

The Depretis–Crispi cabinet did not long survive the opening of the new reign. Crispi's position was shaken by a morally plausible but juridically untenable charge of bigamy, while on 8th March the election of Cairoli, an opponent of the ministry and head of the extremer section of the Left, to the presidency of the Chamber, induced Depretis to tender his resignation to the new king.

Cairoli.

Cairoli succeeded in forming an administration, in which his friend Count Corti, Italian ambassador at Constantinople, accepted the portfolio of foreign affairs, Zanardelli the ministry of the interior, and Seismit Doda the ministry of finance. Though the cabinet had no stable majority, it induced the Chamber to sanction a commercial treaty which had been negotiated with France and a general "autonomous" customs tariff. The commercial treaty was, however, rejected by the French Chamber in June 1878, a circumstance necessitating the application of the Italian general tariff, which implied a 10 to 20 per cent. increase in the duties on the principal French exports. A highly imaginative financial exposition by Seismit Doda, who announced a surplus of £2,400,000, paved the way for a Grist Tax Reduction Bill, which Cairoli had taken over from the Depretis programme. The Chamber, though convinced of the danger of this reform, the perils of which were incisively demonstrated by Sella, voted by an overwhelming majority for an immediate reduction of the impost by one-fourth, and its complete abolition within four years. Cairoli's premiership was, however, destined to be cut short by an attempt made upon the king's life in November 1878, during a royal visit to Naples, by a miscreant named Passanante. In spite of the courage and presence of mind of Cairoli, who received the dagger thrust intended for the king, public and parliamentary indignation found expression in a vote which compelled the ministry to resign.

Though brief, Cairoli's term of office was momentous in regard to foreign affairs. The treaty of San Stefano had led to the convocation of the Berlin Congress, and though Count Corti was by no means ignorant of the rumours concerning secret agreements between Germany, Austria, and Russia, and Germany, Austria, and Great Britain, he scarcely seemed alive to the possible effect of such agreements upon Italy. Replying on 9th April 1878 to interpellations by Visconti Venosta and other deputies on the impending Congress of Berlin, he appeared free from apprehension lest Italy, isolated, might find herself face to face with a change of the balance of power in the Mediterranean, and declared that in the event of serious complications Italy would be "too much sought after rather than too much forgotten." The policy of Italy in the congress, he added, would be to support the interests of the young Balkan nations. Wrapped in this optimism, Count Corti proceeded, as first Italian delegate, to Berlin, where he found himself obliged, on 28th May, to join reluctantly in sanctioning the Austrian occupation of Bosnia and Herzegovina. On 8th July the revelation of the Anglo-Ottoman treaty for the British occupation of Cyprus took the congress by surprise. Italy, who had made the integrity of the Ottoman Empire a cardinal point of her Eastern policy, felt this change of the Mediterranean *status quo* the more severely inasmuch as, in order not to strain her relations with France, she had turned a deaf ear to Austrian, Russian, and German advice to prepare to occupy Tunis in agreement with Great Britain. Count Corti had no suspicion that France had adopted a less disinterested attitude towards similar suggestions from Bismarck and Lord Salisbury. He therefore returned from the German capital with "clean" but empty hands, a plight which found marked disfavour in Italian eyes, and stimulated anti-Austrian Irredentism. Ever since Venetia had been ceded by Austria to the Emperor Napoleon, and by him to Italy, after the war of 1866, secret revolutionary committees had been formed in the northern Italian provinces to prepare for the "redemption" of Trent and Trieste. For twelve years these committees had remained comparatively inactive, but in 1878 the presence of the ex-Garibaldian Cairoli at the head of the Government, and popular dissatisfaction at the spread of Austrian sway on the Adriatic, encouraged them to begin a series of noisy demonstrations. On the evening of the signature at Berlin of the clause sanctioning the Austrian occupation of Bosnia and Herzegovina, an Irredentist riot took place before the Austrian consulate at Venice. The

Italy and the Berlin Congress.

Irredentism.

Italian Government attached little importance to the occurrence, and believed that a diplomatic expression of regret would suffice to allay Austrian irritation. Austria, indeed, might easily have been persuaded to ignore the Irredentist agitation, had not the equivocal attitude of Cairoli and Zanardelli cast doubt upon the sincerity of their regret. The former at Pavia (15th October 1878), and the latter at Arco (3rd November), declared publicly that Irredentist manifestations could not be prevented under existing laws, but gave no hint of introducing any law to sanction their prevention. "Repression, not prevention," became the official formula, the enunciation of which by Cairoli at Pavia caused Count Corti and two other ministers to resign.

The fall of Cairoli, and the formation of a second Depretis cabinet in 1878, brought no substantial change in the attitude of the Government towards Irredentism, nor was the position improved by the return of Cairoli to power in the following July. Though aware of Bismarck's hostility towards Italy, of the conclusion of the Austro-German alliance of 1879, and of the undisguised ill-will of France, Italy not only made no attempt to crush an agitation as mischievous as it was futile, but granted a state funeral to General Avezzana, president of the Irredentist League. In Bonghi's mordant phrase, the foreign policy of Italy during this period may be said to have been characterized by "enormous intellectual impotence counterbalanced by equal moral feebleness." Home affairs were scarcely better managed. Parliament had degenerated into a congeries of personal groups, whose members were eager only to overturn cabinets in order to secure power for the leaders and official favours for themselves. Depretis, who had succeeded Cairoli in December 1878, fell in July 1879, after a vote in which Cairoli and Nicotera joined the Conservative opposition. On 12th July Cairoli formed a new Administration, only to resign on 24th November, and to reconstruct his cabinet with the help of Depretis. The administration of finance was as chaotic as the condition of parliament. The £2,400,000 surplus announced by Seismit Doda proved to be a myth. Nevertheless Magliani, who succeeded Seismit Doda, had neither the perspicacity nor the courage to resist the abolition of the grist tax. The first vote of the Chamber for the immediate diminution of the tax, and for its total abolition on 1st January 1883, had been opposed by the Senate. A second Bill was passed by the Chamber on 18th July 1879, providing for the immediate repeal of the grist tax on minor cereals, and for its total abolition on 1st January 1884. While approving the repeal in regard to minor cereals, the Senate (24th January 1880) again rejected the repeal of the tax on grinding wheat as prejudicial to national finance. After the general election of 1880, however, the Ministeralists, aided by a number of factious Conservatives, passed a third Bill repealing the grist tax on wheat (10th July 1880), the repeal to take effect from 1st January 1884 onwards. The Senate, in which the partizans of the ministry had been increased by numerous appointments *ad hoc*, finally set the seal of its approval upon the measure. Notwithstanding this prospective loss of revenue, parliament showed great reluctance to vote any new impost, although hardly a year previously it had sanctioned (30th June 1879) Depretis's scheme for spending during the next eighteen years £43,200,000 in building 5000 kilometres of railway, an expenditure not wholly justified by the importance of the lines, and useful principally as a source of electoral sops for the constituents of ministerial deputies. The unsatisfactory financial condition of the Florence, Rome, and Naples municipalities necessitated state help, but the Chamber nevertheless proceeded with a light heart (23rd February 1881) to sanction the issue of a foreign loan for £26,000,000, with a view to the abolition of the forced currency, thus adding to the burdens of the exchequer a load which three years later again dragged Italy into the gulf of chronic deficit.

Finance.

In no modern country is error or incompetence on the part of administrators more swiftly followed by retribution than in Italy; both at home and abroad she is hemmed in by political and economic conditions which leave little margin for folly, and still less for "mental and moral insufficiency" such as had been displayed by the Left. Nemesis came in the spring of 1881, in the form of the French invasion of Tunis. Guiccioli, the biographer of Sella, observes that Italian politicians find it especially hard to resist "the temptation of appearing crafty." The men of the Left believed themselves subtle enough to retain the confidence and esteem of all foreign Powers while coquetting at home with elements which some of these Powers had reason to regard with suspicion. Italy, in constant danger from France, needed good relations with Austria and Germany, but could only attain the goodwill of the former by firm treatment of the revolutionary Irredentist agitation, and of the latter by clear demonstration of Italian will and ability to cope with all anti-monarchical forces. Depretis and Cairoli did neither the one nor the other. Hence, when opportunity offered firmly to establish Italian predominance in the central Mediterranean by an occupation of Tunis, they found themselves deprived of those confidential relations with the central Powers, and even with Great Britain, which might have enabled them to use the opportunity to full advantage. The conduct of Italy in declining the suggestions received from Count Andrassy and General Ignatieff on the eve of the Russo-Turkish war—that Italy should seek compensation in Tunis for the extension of Austrian sway in the Balkans—and in subsequently rejecting the German suggestion to come to an arrangement with Great Britain for the occupation of Tunis as compensation for the British occupation of Cyprus, was certainly due to fear lest an attempt on Tunis should lead to a war with France, for which Italy knew herself to be totally unprepared. This very unpreparedness, however, rendered still less excusable her treatment of the Irredentist agitation, which brought her within a hair's-breadth of a conflict with Austria. Although Cairoli, upon learning of the Anglo-Ottoman convention in regard to Cyprus, had advised Count Corti of the possibility that Great Britain might seek to placate France by conniving at a French occupation of Tunis, neither he nor Count Corti had any inkling of the verbal arrangement made between Lord Salisbury and M. Waddington at the instance of Bismarck, that, when convenient, France should occupy Tunis, an agreement afterwards confirmed (with a reserve as to the eventual attitude of Italy) in despatches exchanged in July and August 1878 between the Quai d'Orsay and Downing Street. Almost up to the moment of the French occupation of Tunis the Italian Government believed that Great Britain, if only out of gratitude for the bearing of Italy in connexion with the Dulcigno demonstration in the autumn of 1880, would prevent French acquisition of the Regency. Ignorant of the assurance conveyed to France by Lord Granville that the Gladstone cabinet would respect the engagements of the Beaconsfield–Salisbury administration, Cairoli, in deference to Italian public opinion, endeavoured to neutralize the activity of the French consul Roustan by the appointment of an equally energetic Italian consul, Signor Macciò. The rivalry between these two officials in Tunis contributed not a little to strain

Tunis.

Franco-Italian relations, but it is doubtful whether France would have precipitated her action had not General Menabrea, Italian ambassador in London, urged his Government to purchase the Tunis–Goletta railway from the English company by which it had been constructed. A French attempt to purchase the line was upset in the English courts, and the railway was finally secured by Italy at a price more than eight times its real value. This pertinacity engendered a belief in France that Italy was about to undertake in Tunis a more aggressive policy than necessary for the protection of her commercial interests. M. Roustan therefore hastened to extort from the bey concessions calculated to neutralize the advantages which Italy had hoped to secure by the possession of the Tunis–Goletta line, and at the same time the French Government prepared at Toulon an expeditionary corps for the occupation of the Regency. In the spring of 1881 the Kroumir tribe was reported to have attacked a French force on the Algerian border, and on 9th April M. Roustan informed the bey of Tunis that France would chastise the assailants. The bey issued futile protests to the Powers. On 26th April the island of Tabarca was occupied by the French, Biserta was seized on 2nd May, and on 12th May the bey signed the treaty of Bardo accepting the French protectorate. France undertook the maintenance of order in the Regency, and assumed the representation of Tunis in all dealings with other countries.

Italian indignation at the French *coup de main* was the deeper on account of the apparent duplicity of the Government of the Republic. On 11th May the French foreign minister, M. Barthélémy de Saint Hilaire, had officially assured the Italian ambassador in Paris that France "had no thought of occupying Tunis or any part of Tunisian territory, beyond some points of the Kroumir country." This assurance, dictated by M. Jules Ferry to M. de Saint Hilaire in the presence of the Italian ambassador, and by him telegraphed *en clair* to Rome, was considered a binding pledge that France would not materially alter the *status quo* in Tunis. Documents subsequently published have somewhat attenuated the responsibility of M. Ferry and M. de Saint Hilaire for this breach of faith, and have shown that the French forces in Tunis acted upon secret instructions from General Farre, minister of war in the Ferry cabinet, who pursued a policy diametrically opposed to the official declarations made by the premier and the foreign minister. Even had this circumstance been known at the time, it could scarcely have mitigated the intense resentment of the whole Italian nation at an event which was considered tantamount not only to the destruction of Italian aspirations to Tunis, but to the ruin of the interests of the numerous Italian colony and to a constant menace against the security of the Sicilian and south Italian coasts.

Had the blow thus struck at Italian influence in the Mediterranean induced politicians to sink for a while their personal differences and to unite in presenting a firm front to foreign nations, the crisis in regard to Tunis might not have been wholly unproductive of good. Unfortunately, on this, as on other critical occasions, deputies proved themselves incapable of common effort to promote general welfare. While excitement over Tunis was at its height, but before the situation was irretrievably compromised to the disadvantage of Italy, Cairoli had been compelled to resign by a vote of want of confidence in the Chamber. The only politician capable of dealing adequately with the situation was Sella, leader of the Right, and to him the crown appealed. The faction leaders of the Left, though divided by personal jealousies and mutually incompatible ambitions, agreed that the worst evil which could befall Italy would be the return of the Right to power, and conspired to preclude the possibility of a Sella cabinet. An attempt by Depretis to recompose the Cairoli ministry proved fruitless, and after eleven precious days had been lost, King Humbert was obliged, on 19th April 1881, to refuse Cairoli's resignation. The conclusion of the treaty of Bardo on 12th May, however, compelled Cairoli to sacrifice himself to popular indignation. Again Sella was called upon, but again the dog-in-the-manger policy of Depretis, Cairoli, Nicotera, and Baccarini, in conjunction with the intolerant attitude of some extreme Conservatives, proved fatal to his endeavours. Depretis then succeeded in recomposing the Cairoli cabinet without Cairoli, Mancini being placed at the Foreign Office. Except in regard to an increase of the army estimates, urgently demanded by public opinion, the new ministry had practically no programme. Public opinion was further irritated against France by the massacre of some Italian workmen at Marseilles on the occasion of the return of the French expedition from Tunis, and Depretis, in response to public feeling, found himself obliged to mobilize a part of the militia for military exercises. In this condition of home and foreign affairs occurred disorders at Rome in connexion with the transfer of the remains of Pius IX. from St Peter's to the basilica of San Lorenzo. Most of the responsibility lay with the Vatican, which had arranged the procession in the way best calculated to irritate Italian feeling, but little excuse can be offered for the failure of the Italian authorities to maintain public order. In conjunction with the occupation of Tunis, the effect of these disorders was to exhibit Italy as a country powerless to defend its interests abroad or to keep peace at home. The scandal and the pressure of foreign Catholic opinion compelled Depretis to pursue a more energetic policy, and to publish a formal declaration of the intangibility of the Law of Guarantees.

Growth of the Triple Alliance.

Meanwhile a conviction was spreading that the only way of escape from the dangerous isolation of Italy lay in closer agreement with Austria and Germany. Depretis tardily recognized the need for such agreement, if only to remove the "coldness and invincible diffidence" which, by subsequent confession of Mancini, then characterized the attitude of the central Powers; but he was opposed to any formal alliance, lest it might arouse French resentment, while the new Franco-Italian treaty was still unconcluded, and the foreign loan for the abolition of the forced currency had still to be floated. He, indeed, was not disposed to concede to public opinion anything beyond an increase of the army, a measure insistently demanded by Garibaldi and the Left. The Right likewise desired to strengthen both army and navy, but advocated cordial relations with Berlin and Vienna as a guarantee against French domineering, and as a pledge that Italy would be vouchsafed time to effect her armaments without disturbing financial equilibrium. The Right also hoped that closer accord with Germany and Austria would compel Italy to conform her home policy more nearly to the principles of order prevailing in those empires. More resolute than Right or Left was the Centre, a small group led by Sidney Sonnino, a young politician of unusual fibre, which sought in the press and in parliament to spread a conviction that the only sound basis for Italian policy would be close alliance with the central Powers and a friendly understanding with Great Britain in regard to Mediterranean affairs. The principal Italian public men were divided in opinion on the subject of an alliance. Peruzzi, Lanza, and Bonghi pleaded for equal friendship with all Powers, and especially with France; Crispi, Minghetti, Cadorna, and others, including Blanc, secretary-general to the Foreign

Office, openly favoured a pro-Austrian policy. Austria and Germany, however, scarcely reciprocated these dispositions. The Irredentist agitation had left profound traces at Berlin as well as at Vienna, and had given rise to a distrust of Depretis which nothing had yet occurred to allay. Nor, in view of the comparative weakness of Italian armaments, could eagerness to find an ally be deemed conclusive proof of the value of Italian friendship. Count di Robilant, Italian ambassador at Vienna, warned his Government not to yield too readily to pro-Austrian pressure, lest the dignity of Italy be compromised or her desire for an alliance be granted on onerous terms. Mancini, foreign minister, who was as anxious as Depretis for the conclusion of the Franco-Italian commercial treaty, gladly followed this advice, and limited his efforts to the maintenance of correct diplomatic relations with the central Powers. Except in regard to the Roman question, the advantages and disadvantages of an Italian alliance with Austria and Germany counterbalanced each other. A *rapprochement* with France and a continuance of the Irredentist movement could not fail to arouse Austro-German hostility; but, on the other hand, to draw near to the central Powers would inevitably accentuate the diffidence of France. In the one hypothesis, as in the other, Italy could count upon the moral support of Great Britain, but could not make of British friendship the keystone of a Continental policy. Apart from resentment against France on account of Tunis, there remained the question of the temporal power of the pope to turn the scale in favour of Austria and Germany. Danger of foreign interference in the relations between Italy and the papacy had never been so great since the Italian occupation of Rome as when, in the summer of 1881, the disorders during the transfer of the remains of Pius IX. had lent an unwonted ring of plausibility to the papal complaint concerning the "miserable" position of the Holy See. Bismarck at that moment had entered upon his pilgrimage to Canossa, and was anxious to obtain from the Vatican the support of German Catholics. What resistance could Italy have offered had the German chancellor, seconded by Austria, and assuredly supported by France, called upon Italy to revise the Law of Guarantees in conformity with Catholic exigencies, or had he taken the initiative of making papal independence the subject of an international conference? Friendship and alliance with Catholic Austria and powerful Germany could alone lay this spectre. This was the only immediate advantage Italy could hope to obtain by drawing nearer the central Powers.

The political conditions of Europe favoured the realization of Italian desires. Growing rivalry between Austria and Russia in the Balkans rendered the continuance of the "League of the Three Emperors" a practical impossibility. The Austro-German alliance of 1879 formally guaranteed the territory of the contracting parties, but Austria could not count upon effectual help from Germany in case of war, since Russian attack upon Austria would certainly have been followed by French attack upon Germany. As in 1869–70, it therefore became a matter of the highest importance for Austria to retain full disposal of all her troops by assuring herself against Italian aggression. The Tsar, Alexander III., under the impression of the assassination of his father, desired, however, the renewal of the *Dreikaiserbund*, both as a guarantee of European peace and as a conservative league against revolutionary parties. The German emperor shared this desire, but Bismarck and the Austrian emperor wished to substitute for the imperial league some more advantageous combination. Hence a tacit understanding between Bismarck and Austria that the latter should profit by Italian resentment against France to draw Italy into the orbit of the Austro-German alliance. For the moment Germany was to hold aloof lest any active initiative on her part should displease the Vatican, of whose help Bismarck stood in need.

At the beginning of August 1881 the Austrian press mooted the idea of a visit from King Humbert to the Emperor Francis Joseph. Count di Robilant, anxious that Italy should not seem to beg a smile from the central Powers, advised Mancini to receive with caution the suggestions of the Austrian press. Depretis took occasion to deny, in a form scarcely courteous, the probability of the visit. Robilant's opposition to a precipitate acceptance of the Austrian hint was founded upon fear lest King Humbert at Vienna might be pressed to disavow Irredentist aspirations, and upon a desire to arrange for a visit of the Emperor Francis Joseph to Rome in return for King Humbert's visit to Vienna. Seeing the hesitation of the Italian Government, the Austrian and German semi-official press redoubled their efforts to bring about the visit. By the end of September the idea had gained such ground in Italy that the visit was practically settled, and on 7th October Mancini informed Robilant (who was then in Italy) of the fact. Though he considered such precipitation impolitic, Robilant, finding that confidential information of Italian intentions had already been conveyed to the Austrian Government, sought an interview with King Humbert, and on 17th October started for Vienna to settle the conditions of the visit. Depretis, fearing to jeopardize the impending conclusion of the Franco-Italian commercial treaty, would have preferred the visit to take the form of an act of personal courtesy between sovereigns. The Austrian Government, for its part, desired that the king should be accompanied by Depretis, though not by Mancini, lest the presence of the Italian foreign minister should lend to the occasion too marked a political character. Mancini, unable to brook exclusion, insisted, however, upon accompanying the king. King Humbert with Queen Margherita reached Vienna on the morning of 27th October, and stayed at the Hofburg until 31st October. The visit was marked by the greatest cordiality, Count Robilant's fears of inopportune pressure with regard to Irredentism proving groundless. Both in Germany and Austria the visit was construed as a preliminary to the adhesion of Italy to the Austro-German alliance. Count Hatzfeldt, on behalf of the German Foreign Office, informed the Italian ambassador in Berlin that whatever was done at Vienna would be regarded as having been done in the German capital. Nor did nascent irritation in France prevent the conclusion of the Franco-Italian commercial treaty, which was signed at Paris on 3rd November.

In Italy public opinion as a whole was favourable to the visit, especially as it was not considered an obstacle to the projected increase of the army and navy. Doubts, however, soon sprang up as to its effect upon the minds of Austrian statesmen, since on 8th November the language employed by Baron de Kallay and Count Andrassy to the Hungarian delegations on the subject of Irredentism was scarcely calculated to soothe Italian susceptibilities. But on 9th November the European situation was suddenly modified by the formation of the Gambetta cabinet, and, in view of the policy of revenge with which Gambetta was supposed to be identified, it became imperative for Bismarck to assure himself that Italy would not be enticed into a Francophil attitude by any concession Gambetta might offer. As usual when dealing with weaker nations, the German chancellor resorted to intimidation. He not only re-established the Prussian legation to the Vatican, suppressed since 1874, and omitted from the imperial

message to the Reichstag (17th November 1881) all reference to King Humbert's visit to Vienna, but took occasion on 29th November to refer to Italy as a country tottering on the verge of revolution, and opened in the German semi-official press a campaign in favour of an international guarantee for the independence of the papacy. These manœuvres produced their effect upon Italian public opinion. In the long and important debate upon foreign policy in the Italian Chamber of Deputies (6th to 9th December) the fear was repeatedly expressed lest Bismarck should seek to purchase the support of German Catholics by raising the Roman question. Mancini, still unwilling frankly to adhere to the Austro-German alliance, found his policy of "friendship all round" impeded by Gambetta's uncompromising attitude in regard to Tunis. Bismarck nevertheless continued his press campaign in favour of the temporal power until, reassured by Gambetta's decision to send M. Roustan back to Tunis to complete as minister the anti-Italian programme begun as consul, he finally instructed his organs to emphasize the common interests of Germany and Italy on the occasion of the opening of the St Gothard tunnel. But the effect of the German press campaign could not be effaced in a day. At the new year's reception of deputies King Humbert aroused enthusiasm by a significant remark that Italy intended to remain "mistress in her own house"; while Mancini addressed to Count de Launay, Italian ambassador in Berlin, a haughty despatch, repudiating the supposition that the pope might (as Bismarckian emissaries had suggested to the Vatican) obtain abroad greater spiritual liberty than in Rome, or that closer relations between Italy and Germany, such as were required by the interests and aspirations of the two countries, could be made in any way contingent upon a modification of Italian freedom of action in regard to home affairs.

The sudden fall of Gambetta (26th January 1882) having removed the fear of immediate European complications, the cabinets of Berlin and Vienna again displayed diffidence towards Italy. So great was Bismarck's distrust of Italian parliamentary instability, his doubts of Italian capacity for offensive warfare, and his fear of the Francophil tendencies of Depretis, that for many weeks the Italian ambassador at Berlin was unable to obtain audience of the chancellor. But for the Tunisian question Italy might again have been drawn into the wake of France. Mancini tried to impede the organization of French rule in the Regency by refusing to recognize the treaty of Bardo, yet so careless was Bismarck of Italian susceptibilities, that he instructed the German consul at Tunis to recognize French decrees. Partly under the influence of these circumstances, and partly in response to persuasion by Baron Blanc, secretary-general for foreign affairs, Mancini instructed Count di Robilant to open negotiations for an Italo-Austrian alliance—instructions which Robilant neglected until questioned by Count Kalnoky on the subject. The first exchange of ideas between the two Governments proved fruitless, since Kalnoky, somewhat Clerically-minded, was averse from guaranteeing the integrity of all Italian territory, and Mancini was equally unwilling to guarantee to Austria permanent possession of Trent and Trieste. Mancini, moreover, wished the treaty of alliance to provide for reciprocal protection of the chief interests of the contracting Powers, Italy undertaking to second Austria-Hungary in the Balkans, and Austria and Germany pledging themselves to support Italy in Mediterranean questions. Without some such proviso Italy would, in Mancini's opinion, be exposed single-handed to French resentment. At the request of Kalnoky, Mancini defined his proposal in a memorandum, but the illness of himself and Depretis, combined with an untoward discussion in the Italian press on the failure of the Austrian emperor to return in Rome King Humbert's visit to Vienna, caused negotiations to drag. The pope, it transpired, had refused to receive the emperor if he came to Rome on a visit to the Quirinal, and Francis Joseph, though anxious to return King Humbert's visit, was unable to offend the feelings of his Catholic subjects. Meanwhile (11th May 1882) the Italian parliament adopted the new Army Bill, involving a special credit of £5,100,000 for the creation of two new army corps, by which the war footing of the regular army was raised to nearly 850,000 men and the ordinary military estimates to £8,000,000 per annum. Garibaldi, who, since the French occupation of Tunis, had ardently worked for the increase of the army, had thus the satisfaction of seeing his desire realized before his death at Caprera, on 2nd June 1882. "In spirit a child, in character a man of classic mould," Garibaldi had remained the nation's idol, an almost legendary hero whose place none could aspire to fill. Gratitude for his achievements and sorrow for his death found expression in universal mourning wherein king and peasant equally joined. Before his death, and almost contemporaneously with the passing of the Army Bill, negotiations for the alliance were renewed. Encouraged from Berlin, Kalnoky agreed to the reciprocal territorial guarantee, but declined reciprocity in support of special interests. Mancini had therefore to be content with a declaration that the allies would act in mutually friendly intelligence. Depretis made some opposition, but finally acquiesced, and the treaty of triple alliance was signed on 20th May 1882, five days after the promulgation of the Franco-Italian commercial treaty in Paris. Though partial revelations have been made, the exact tenor of the treaty of triple alliance has never been divulged. It is known to have been concluded for a period of five years, to have pledged the contracting parties to join in resisting attack upon the territory of any one of them, and to have specified the military disposition to be adopted by each in case attack should come either from France, or from Russia, or from both simultaneously. The Italian General Staff is said to have undertaken, in the event of war against France, to operate with two armies on the north-western frontier against the French armée des Alpes, of which the war strength is about 250,000 men. A third Italian army would, if expedient, pass into Germany, to operate against either France or Russia. Austria undertook to guard the Adriatic on land and sea, and to help Germany by checkmating Russia on land. Germany would be sufficiently employed in carrying on war against two fronts. Kalnoky desired that both the terms of the treaty and the fact of its conclusion should remain secret, but Bismarck and Mancini hastened to hint at its existence, the former in the Reichstag on 12th June 1882, and the latter in the Italian semi-official press. A revival of Irredentism in connexion with the execution of an Austrian deserter named Oberdank, who after escaping into Italy endeavoured to return to Austria with explosive bombs in his possession, and the cordial references to France made by Depretis at Stradella (8th October 1882), prevented the French Government from suspecting the existence of the alliance, or from ceasing to strive after a Franco-Italian understanding. Suspicion was not aroused until March 1883, when Mancini, in defending himself against strictures upon his refusal to co-operate with Great Britain in Egypt, practically revealed the existence of the treaty, thereby irritating France and destroying Depretis's secret hope of finding in the triple alliance the advantage of an Austro-German guarantee without the disadvantage of French enmity. In Italy the revelation

Death of Garibaldi.

Signature of the Treaty, 1882.

of the treaty was hailed with satisfaction except by the Clericals, who were enraged at the blow thus struck at the restoration of the pope's temporal power, and by the Radicals, who feared both the inevitable breach with republican France and the reinforcement of Italian constitutional parties by intimacy with strong monarchical states such as Germany and Austria. These very considerations naturally combined to recommend the fact to constitutionalists, who saw in it, besides the territorial guarantee, the elimination of the danger of foreign interference in the relations between Italy and the Vatican, such as Bismarck had recently threatened and such as France was believed ready to propose.

Nevertheless, during its first period (1882–87) the triple alliance failed to ensure cordiality between the contracting Powers. Mancini exerted himself in a hundred ways to soothe French resentment. He not only refused to join Great Britain in the Egyptian expedition, but agreed to suspend Italian consular jurisdiction in Tunis, and deprecated suspicion of French designs upon Morocco. His efforts were worse than futile. France remained cold, while Bismarck and Kalnoky, distrustful of the Radicalism of Depretis and Mancini, assumed towards their ally an attitude almost hostile. Possibly Germany and Austria may have been influenced by the secret treaty signed between Austria, Germany, and Russia on 21st March 1884, and ratified during the meeting of the three emperors at Skiernewice in September of that year, by which Bismarck, in return for "honest brokerage" in the Balkans, is understood to have obtained from Austria and Russia a promise of benevolent neutrality in case Germany should be "forced" to make war upon a fourth Power—France. Guaranteed thus against Russian attack, Italy became in the eyes of the central Powers a negligible quantity, and was treated accordingly. Though kept in the dark as to the Skiernewice arrangement, the Italian Government soon discovered from the course of events that the triple alliance had practically lost its object, European peace having been assured without Italian cooperation. Meanwhile France provided Italy with fresh cause for uneasiness by abating her hostility to Germany. Italy in consequence drew nearer to Great Britain, and at the London conference on the Egyptian financial question sided with Great Britain against Austria and Germany. At the same time negotiations took place with Great Britain for an Italian occupation of Massawa, and Mancini, dreaming of a vast Anglo-Italian enterprise against the Mahdi, expatiated in the spring of 1885 upon the glories of an Anglo-Italian alliance, an indiscretion which drew upon him a scarcely-veiled *démenti* from London. Again speaking in the Chamber, Mancini claimed for Italy the principal merit in the conclusion of the triple alliance, but declared that the alliance left Italy full liberty of action in regard to interests outside its scope, "especially as there was no possibility of obtaining protection for such interests from those who by the alliance had not undertaken to protect them." These words, which revealed the absence of any stipulation in regard to the protection of Italian interests in the Mediterranean, created lively dissatisfaction in Italy and corresponding satisfaction in France. They hastened Mancini's downfall (17th June 1885), and prepared the advent of Count di Robilant, who three months later succeeded Mancini at the Italian Foreign Office. Robilant, for whom the Skiernewice pact was no secret, followed a firmly independent policy throughout the Bulgarian crisis of 1885–86, declining to be drawn into any action beyond that required by the treaty of Berlin and the protection of Italian interests in the Balkans. Italy, indeed, came out of the Eastern crisis with enhanced prestige and with her relations to Austria greatly improved. Towards Prince Bismarck Robilant maintained an attitude of dignified independence, and as, in the spring of 1886, the moment for the renewal of the triple alliance drew near, he profited by the development of the Bulgarian crisis and the threatened Franco-Russian understanding to secure from the central Powers "something more" than the bare territorial guarantee of the original treaty. This "something more" consisted, at least in part, of the arrangement, with the help of Austria and Germany, of an Anglo-Italian naval understanding having special reference to the Eastern question, but providing for common action by the British and Italian fleets in the Mediterranean in case of war. A vote of the Italian Chamber on 4th February 1887, in connexion with the disaster to Italian troops at Dogali, in Abyssinia, brought about the resignation of the Depretis–Robilant cabinet. The crisis dragged for three months, and before its definitive solution by the formation of a Depretis–Crispi ministry, Robilant succeeded (17th March 1887) in renewing the triple alliance on terms more favourable to Italy than those obtained in 1882. Not only did he secure concessions from Austria and Germany corresponding in some degree to the improved state of the Italian army and navy, but, in virtue of the Anglo-Italian understanding, assured the practical adhesion of Great Britain to the European policy of the central Powers, a triumph probably greater than any registered by Italian diplomacy since the completion of national unity.

First renewal of the Triple Alliance.

The period between May 1881 and July 1887 occupied, in the region of foreign affairs, by the negotiation, conclusion, and renewal of the triple alliance, by the Bulgarian crisis, and by the dawn of an Italian colonial policy, was marked at home by urgent political and economic problems, and by the parliamentary phenomena known as *trasformismo*. On 29th June 1881 the Chamber adopted a Franchise Reform Bill, which increased the electorate from 600,000 to 2,000,000 by lowering the fiscal qualification from 40 to 19·80 lire in direct taxation, and by extending the suffrage to all persons who had passed through the two lower standards of the elementary schools, and practically to all persons able to read and write. The immediate result of the reform was to increase the political influence of large cities where the proportion of illiterate workmen was lower than in the country districts, and to exclude from the franchise numbers of peasants and small proprietors who, though of more conservative temperament and of better economic position than the artizan population of the large towns, were often unable to fulfil the scholarship qualification. On 12th April 1883 the forced currency was formally abolished by the resumption of treasury payments in gold with funds obtained through a loan of £14,500,000 issued in London on 5th May 1882. Owing to the hostility of the French market, the loan was covered with difficulty, and, though the gold premium fell and commercial exchanges were temporarily facilitated by the resumption of cash payments, it is doubtful whether these advantages made up for the burden of £640,000 additional annual interest thrown upon the exchequer. On 6th March 1885 parliament finally sanctioned the conventions by which state railways were farmed out to three private companies—the Mediterranean, Adriatic, and Sicilian. The railways redeemed in 1875–76 had been worked in the interval by the Government at a heavy loss. A commission of inquiry reported in favour of private management. The conventions, concluded for a period of sixty years, but terminable by either party

Internal reforms.

after twenty or forty years, retained for the state the possession of the lines, but sold rolling stock to the companies, arranged various schedules of state subsidy for lines projected or in course of construction, guaranteed interest on the bonds of the companies, and arranged for the division of revenue between the companies, the reserve fund, and the state. National control of the railways was secured by a proviso that the directors must be of Italian nationality. Depretis and his colleague Genala, minister of public works, experienced great difficulty in securing parliamentary sanction for the conventions, not so much on account of their defective character, as from the opposition of local interests anxious to extort new lines from the Government. In fact, the conventions were only voted by a majority of twenty-three votes after the Government had undertaken to increase the length of new state-built lines from 1500 to 2500 kilometres. Unfortunately, the calculation of probable railway revenue on which the conventions had been based proved to be enormously exaggerated. For many years the 37½ per cent. of the gross revenue (less the cost of maintaining the rolling stock, incumbent on the state) scarcely sufficed to pay the interest on debts incurred for railway construction and on the guaranteed bonds. A competent German authority has calculated that, on the whole, railways have cost Italian taxpayers £8,000,000 a year. Gradually the increase of traffic consequent upon the industrial development of Italy has decreased the annual losses of the state, but the position of the Government in regard to the railways still remains so unsatisfactory that the basis of the conventions will probably be radically altered on the expiration of the first period of twenty years in 1905.

The railway conventions.

Intimately bound up with the forced currency, the railway conventions, and public works was the financial question in general. From 1876, when equilibrium between expenditure and revenue had first been attained, taxation yielded steady annual surpluses, which in 1881 reached the satisfactory level of £2,120,000. The gradual abolition of the grist tax on minor cereals diminished the surplus in 1882 to £236,000, and in 1883 to £110,000, while the total repeal of the grist tax on wheat, which took effect on 1st January 1884, coincided with the opening of a new and disastrous period of deficit. True, the repeal of the grist tax was not the only, nor possibly even the principal, cause of the deficit. The policy of "fiscal transformation" inaugurated by the Left increased revenue from indirect taxation from £17,000,000 in 1876 to more than £24,000,000 in 1887, by substituting heavy corn duties for the grist tax, and by raising the sugar and petroleum duties to unprecedented levels. But partly from lack of firm financial administration, partly through the increase of military and naval expenditure (which in 1887 amounted to £9,000,000 for the army, while special efforts were made to strengthen the navy), and principally through the constant drain of railway construction and public works, the demands upon the exchequer grew largely to exceed the normal increase of revenue, and necessitated the contraction of new debts. In their anxiety to remain in office Depretis and the Finance Minister, Magliani, never hesitated to mortgage the financial future of their country. No concession could be denied to deputies, or groups of deputies, whose support was indispensable to the life of the cabinet, nor, under such conditions, was it possible to place any effective check upon administrative abuses in which politicians or their electors were interested. Railways, roads, and harbours which contractors had undertaken to construct for reasonable amounts were frequently made to cost thrice the original estimates. Minghetti, in a trenchant exposure of the parliamentary condition of Italy during this period, cites a case in which a credit for certain public works was, during a debate in the Chamber, increased by the Government from £6,600,000 to £9,000,000 in order to conciliate local political interests. In the spring of 1887 Genala, minister of public works, was taken to task for having sanctioned expenditure of £80,000,000 on railway construction while only £40,000,000 had been included in the estimates. As most of these credits were spread over a series of years, succeeding Administrations found their financial liberty of action destroyed, and were obliged to cover deficit by constant issues of consolidated stock. Thus the deficit of £940,000 for the financial year 1885–86 rose to nearly £2,920,000 in 1887–88, and in 1888–89 attained the terrible level of £9,400,000.

Finance.

Nevertheless, in spite of many and serious shortcomings, the long series of Depretis administrations was marked by the adoption of some useful measures. Besides the realization of the formal programme of the Left, consisting of the repeal of the grist tax, the abolition of the forced currency, the extension of the suffrage, and the development of the railway system, Depretis laid the foundation for land tax re-assessment by introducing a new cadastral survey. Unfortunately, the new survey was made largely optional, so that provinces which had reason to hope for a diminution of land tax under a revised assessment hastened to complete their survey, while others, in which the average of the land tax was, and is, below a normal assessment, have neglected to comply with the provisions of the scheme. Hence, pending compulsory completion of the survey, the Land Tax Equalization Bill has resulted in loss to the exchequer. An important undertaking, known as the Agricultural Inquiry, brought to light vast quantities of information valuable for future agrarian legislation. The year 1885 saw the introduction and adoption of a measure embodying the principle of employers' liability for accidents to workmen, a principle subsequently extended and more equitably defined in the spring of 1899. An effort to encourage the development of the mercantile marine was made in the same year, and a convention was concluded with the chief lines of passenger steamers to retain their fastest vessels as auxiliaries to the fleet in case of war. Sanitation and public hygiene received a potent impulse from the cholera epidemic of 1884, many of the unhealthiest quarters in Naples and other cities being demolished and rebuilt, with funds chiefly furnished by the state. The movement was strongly supported by King Humbert, whose intrepidity in visiting the most dangerous spots at Busca and Naples while the epidemic was at its height, reassuring the panic-stricken inhabitants by his presence, excited the enthusiasm of his people and the admiration of Europe.

During the accomplishment of these and other reforms the condition of parliament underwent profound change. By degrees the Administrations of the Left had ceased to rely solely upon the Liberal sections of the Chamber, and had carried their most important Bills with the help of the Right. This process of transformation was not exclusively the work of Depretis, but had been initiated as early as 1873, when a portion of the Right under Minghetti had, by joining the Left, overturned the Lanza–Sella cabinet. In 1876 Minghetti himself had fallen a victim to a similar defection of Conservative deputies. The practical annihilation of the old Right in the elections of 1876 opened a new parliamentary era. Reduced in number to less than one hundred, and radically changed in spirit and composition, the Right gave way, if not to despair, at least to a despondency unsuited to an

"Trasformismo."

opposition party. Though on more than one occasion personal rancour against the men of the Moderate Left prevented the Right from following Sella's advice and regaining, by timely coalition with cognate parliamentary elements, a portion of its former influence, the bulk of the party, with singular inconsistency, drew nearer and nearer to the Liberal cabinets. The process was accelerated by Sella's illness and death (14th March 1884), an event which cast profound discouragement over the more thoughtful of the Conservatives and Moderate Liberals, by whom Sella had been regarded as a supreme political reserve, as a statesman whose experienced vigour and patriotic sagacity might have been trusted to lift Italy from any depth of folly or misfortune. By a strange anomaly the Radical measures brought forward by the Left diminished instead of increasing the distance between it and the Conservatives. Numerically insufficient to reject such measures, and lacking the fibre and the cohesion necessary for the pursuance of a far-sighted policy, the Right thought prudent not to employ its strength in uncompromising opposition, but rather, by supporting the Government, to endeavour to modify Radical legislation in a Conservative sense. In every case the calculation proved fallacious. Radical measures were passed unmodified, and the Right was compelled sadly to accept the accomplished fact. Thus it was with the abolition of the grist tax, the reform of the suffrage, the railway conventions, and many other Bills. When, in course of time, the extended suffrage increased the Republican and Extreme Radical elements in the Chamber, and the Liberal "Pentarchy" (composed of Crispi, Cairoli, Nicotera, Zanardelli, and Baccarini) assumed an attitude of bitter hostility to Depretis, the Right, obeying the impulse of Minghetti, rallied openly to Depretis, lending him aid without which his prolonged term of office would have been impossible. The result was parliamentary chaos, baptized *trasformismo*. In May 1883 this process received official recognition by the elimination of the Radicals Zanardelli and Baccarini from the Depretis cabinet, while in the course of 1884 a Conservative, Signor Biancheri, was elected to the presidency of the Chamber, and another Conservative, General Ricotti, appointed to the War Office. Though Depretis, at the end of his life in 1887, showed signs of repenting of the confusion thus created, he had established a parliamentary system destined largely to sterilize and vitiate the political life of Italy.

Colonial policy.

Contemporaneously with the vicissitudes of home and foreign policy under the Left there grew up in Italy a marked tendency towards colonial enterprise. The tendency itself dated from 1869, when a congress of the Italian chambers of commerce at Genoa had urged the Lanza cabinet to establish a commercial depôt on the Red Sea. On 11th March 1870 an Italian shipper, Signor Rubattino, had bought the bay of Assab, with the neighbouring island of Darmakieh, from the local Sultan Berehan for £1880, the funds being furnished by the Government. In consequence of this purchase an exchange of despatches had taken place in 1871 between the Italian foreign minister, Visconti Venosta, and the Egyptian Government, the latter being unwilling to recognize the sovereignty of Berehan over Assab or his right to sell territory to a foreign Power. So decided was Egyptian opposition that Visconti Venosta thought it opportune not to occupy Assab, but to allow the question to slumber. No further step was taken until, at the end of 1879, Rubattino prepared to establish a commercial station at Assab. The British Government made inquiry as to his intentions, and on 19th April 1880 received a formal undertaking from Cairoli that Assab would never be fortified nor be made a military establishment. Meanwhile (January 1880) stores and materials were landed, and Assab was permanently occupied. Eighteen months later a party of Italian sailors and explorers under Lieutenant Biglieri and Signor Giulietti were massacred in Egyptian territory. Egypt, however, refused to make thorough inquiry into the massacre, and was only prevented from occupying Raheita and coming into conflict with Italy by the good offices of Lord Granville, who dissuaded the Egyptian Government from enforcing its sovereignty. On 20th September 1881 Berehan formally accepted Italian protection, and in the following February an Anglo-Italian convention established the Italian title to Assab on condition that Italy should formally recognize the suzerainty of the Porte and of the khedive over the Red Sea coast, and should prevent the transport of arms and munitions of war through the territory of Assab. This convention was never recognized by the Porte nor by the Egyptian Government. A month later (10th March 1882) Rubattino made over his establishment to the Italian Government, and on 12th June the Chamber adopted a Bill constituting Assab an Italian crown colony.

The Egyptian Question.

Within four weeks of the adoption of this Bill the bombardment of Alexandria by the British fleet (11th July 1882) opened an era destined profoundly to affect the colonial position of Italy. The revolt of Arabi Pasha (September 1881) had led to the meeting of an ambassadorial conference at Constantinople under the presidency of the Italian ambassador, Count Corti. The conference had been promoted by Mancini, Italian minister for foreign affairs, in the hope of preventing European intervention in Egypt and the permanent establishment of an Anglo-French condominium to the detriment of Italian influence. Prior to the meeting of the conference Italy had proposed to the Powers that a mandate be conferred upon Turkey to intervene in the Egyptian crisis, and the Porte hastened to despatch to Cairo a high commissioner, Dervish Pasha, whose arrival at Cairo led to the sanguinary riots of 11th June 1882. At the opening of the conference (23rd June 1882) Italy secured the signature of a self-denying protocol whereby all the great Powers undertook to avoid isolated action in their own individual interests; but the rapid development of the crisis in Egypt, and the refusal of France to co-operate with Great Britain in the restoration of order, necessitated vigorous action by the latter alone. In view of the French refusal, Lord Granville on 27th July invited Italy to join in restoring order in Egypt; but Mancini and Depretis, in spite of the efforts of Crispi, then in London, declined the offer. Financial considerations, lack of proper transports for an expeditionary corps, fear of displeasing France, dislike of a "policy of adventure," misplaced deference towards the ambassadorial conference in Constantinople, and unwillingness to thwart the current of Italian sentiment in favour of the Egyptian "nationalists," were the chief motives of the Italian refusal, which had the effect of somewhat estranging Great Britain and Italy. Anglo-Italian relations, however, regained their normal cordiality two years later, and found expression in the support lent by Italy to the British proposal at the London conference on the Egyptian question (July 1884), for which Great Britain officially returned thanks. About the same time Mancini was informed by the Italian agent in Cairo that Great Britain would be well disposed towards an Italian occupation of a part of the Red Sea coast. Having sounded Lord Granville, Mancini received encouragement to seize Beilul and Massawa, in view of the projected restriction of the Egyptian zone of military occupation. Lord Granville

further inquired whether Italy would co-operate in pacifying the Sudan, and received an affirmative reply. Italian action was hastened by news that, in December 1884, an exploring party under Signor Bianchi, royal commissioner for Assab, had been massacred in the Haussa country, an event which aroused in Italy a desire to punish the assassins and to obtain satisfaction for the still unpunished massacre of Signor Giulietti and his companions. Partly to satisfy public opinion, partly in order to profit by the favourable disposition of the British Government, and partly in the hope of remedying the error committed in 1882 by refusal to co-operate with Great Britain in Egypt, the Italian Government in January 1885 despatched an expedition under Admiral Caimi and Colonel Saletta to occupy Massawa and Beilul. The occupation, effected on 5th February, was accelerated by fear lest Italy might be forestalled by France or Russia, both of which Powers were suspected of desiring to establish themselves firmly on the Red Sea and to exercise a protectorate over Abyssinia. News of the occupation reached Europe simultaneously with the tidings of the fall of Khartum, an event which disappointed Italian hopes of military co-operation with Great Britain in the Sudan. The resignation of the Gladstone–Granville cabinet further precluded the projected Italian occupation of Suakin, and the Italians, wisely refraining from an independent attempt to succour Kassala, then besieged by the Mahdists, bent their efforts to the increase of their zone of occupation around Massawa. Arafali, 50 miles south, and Arkiko, 9 miles south-east, of Massawa were occupied during the month of April. The extension of the Italian zone excited the suspicions of Johannes, negus of Abyssinia, whose apprehensions were assiduously fomented by Alula, ras of Tigré, and by French and Greek adventurers. In order to reassure the negus, Captain Ferrari and Dr Nerazzini were despatched on a mission to Abyssinia. The mission was apparently successful, and arrangements were made with the negus for the ratification of undertakings entered into by Ferrari and Nerazzini by means of a second mission under General Pozzolini. Protection inopportunely accorded by Italy to enemies of Ras Alula, however, induced the Abyssinians to assume an attitude so hostile that the Pozzolini mission had to be abandoned. In January 1886 Ras Alula raided the village of Wa, to the west of Zula, but towards the end of the year (23rd November) Wa was occupied by the irregular troops of General Gené, who had superseded Colonel Saletta at Massawa. Angered by this step, Ras Alula took prisoners the members of an Italian exploring party commanded by Count Salimbeni, and held them as hostages for the evacuation of Wa. General Gené nevertheless reinforced Wa and pushed forward to Saati a detachment from Arkiko. On 25th January 1887 Ras Alula attacked Saati, but was repulsed with loss. On the following day, however, the Abyssinians succeeded in surprising, near the village of Dogali, an Italian force of 524 officers and men under Colonel De Cristoforis, who were convoying provisions to the garrison of Saati. The Abyssinians, 20,000 strong, speedily overwhelmed the small Italian force, which, after exhausting its ammunition, was destroyed where it stood. One man only escaped. Four hundred and seven men and twenty-three officers were killed outright, and one officer and eighty-one men wounded. Dead and wounded alike were horribly mutilated by order of Alula. Fearing a new attack, General Gené withdrew his forces from Saati, Wa, and Arafali; but the losses of the Abyssinians at Saati and Dogali had been so heavy as to dissuade Alula from further hostilities.

Disaster of Dogali.

In Italy the disaster of Dogali produced consternation, and caused the fall of the Depretis–Robilant cabinet. The Chamber, eager for revenge, voted a credit of £200,000, and sanctioned the despatch of reinforcements. General Gené was reprimanded, and superseded by General Saletta, who fortified Massawa and prepared to resist further attack. Meanwhile Signor Crispi, who, though averse from colonial adventure, desired to vindicate Italian honour, entered the Depretis cabinet as minister of the interior, and obtained from parliament a new credit of £800,000. In November 1887 a strong expedition under General di San Marzano raised the strength of the Massawa garrison to nearly 20,000 men. The British Government, desirous of preventing an Italo-Abyssinian conflict, which could but strengthen the position of the Mahdists, despatched Sir Gerald Portal from Massawa on 29th October to mediate with the negus. The mission proved fruitless. Sir Gerald Portal returned to Massawa on 25th December 1887, and warned the Italians that Johannes was preparing to attack them in the following spring with an army of 100,000 men. On 28th March 1888 the negus indeed descended from the Abyssinian high plateau in the direction of Saati, but finding the Italian position too strong to be carried by assault, temporized and opened negotiations for peace. His tactics failed to entice the Italians from their position, and on 3rd April sickness among his men compelled Johannes to withdraw the whole Abyssinian army to Ghinda. Danger being past, General di San Marzano was recalled from Massawa and the colonial garrison considerably reduced. The negus next marched against Menelek, king of Shoa, whose neutrality Italy had purchased with 5000 Remington rifles and a supply of ammunition, but found him with 80,000 men too strongly entrenched to be successfully attacked. Tidings of a new Mahdist incursion into Abyssinian territory reached the negus at that moment, and induced him to postpone the settlement of his quarrel with Menelek until the dervishes had been chastised. Marching towards the Nile, he joined battle with the Mahdists, but on 10th March 1889 was defeated and killed near Metammeh. His death gave rise to an Abyssinian war of succession between Mangashà, natural son of Johannes, and Menelek, grandson of the Negus Sella-Sellassié. Menelek, by means of Count Antonelli, resident in the Shoa country, requested Italy to execute a diversion in his favour by occupying Asmarà and other points on the high plateau. Antonelli profited by the situation to obtain Menelek's signature to a treaty fixing the frontiers of the Italian colony and defining Italo-Abyssinian relations. The treaty, signed at Ucciali on 2nd May 1889, arranged for regular intercourse between Italy and Abyssinia; conceded to Italy a portion of the high plateau, with the positions of Halai, Saganeiti, and Asmarà; fixed an import and export duty of 8 per cent. *ad valorem* on caravans entering and leaving Ethiopia for Massawa; reserved to Menelek the exclusive right to import firearms; arranged for reciprocal extradition of criminals; prohibited the slave trade, and accorded to Italy special commercial privileges. The main point of the treaty, however, lay in clause 17: "His Majesty the King of Kings of Ethiopia *consents* to make use of the Government of His Majesty the King of Italy for the treatment of all questions concerning other Powers and Governments." Upon this clause Italy founded her claim to a protectorate over Abyssinia. In September 1889 the treaty of Ucciali was ratified in Italy by Menelek's lieutenant, the Degiacc Makonnen, who was received by the Italian Government with great pomp and ceremony. Makonnen further concluded with the Italian premier, Crispi, a convention whereby Italy recognized

Abyssinia.

Treaty of Ucciali.

Menelek as emperor of Ethiopia, Menelek recognized the Italian colony, and arranged for a special Italo-Abyssinian currency and for a loan. On 11th October Italy communicated article 17 of the treaty of Ucciali to the European Powers, interpreting it as a valid title to an Italian protectorate over Abyssinia. Russia alone neglected to take note of the communication, and persisted in the hostile attitude she had assumed at the moment of the occupation of Massawa. Meanwhile the Italian mint coined thalers bearing the portrait of King Humbert, with an inscription referring to the Italian protectorate, and on 1st January 1890 a royal decree conferred upon the colony the name of "Eritrea."

Operations in Abyssinia.

In the colony itself General Baldissera, who had replaced General Saletta, delayed the movement against Mangashà desired by Menelek. The Italian general would have preferred to wait until his intervention was requested by both pretenders to the Abyssinian throne. Pressed by the home Government, he, however, instructed a native ally to occupy the important positions of Keren and Asmarà, and prepared himself to take the offensive against Mangashà and Ras Alula. The latter retreated south of the river Mareb, leaving the whole of the cis-Mareb territory, including the provinces of Hamasen, Agameh, Seraè, and Okulè-Kusai, in Italian hands. General Orero, successor of Baldissera, pushed offensive action more vigorously, and on 26th January 1890 entered Adowa, a city considerably to the south of the Mareb—an imprudent step which aroused Menelek's suspicions, and had hurriedly to be retraced. Mangashà, seeing further resistance to be useless, submitted to Menelek, who at the end of February ratified at Makallé the additional convention to the treaty of Ucciali, but refused to recognize the Italian occupation of the Mareb. The negus, however, conformed to article 17 of the treaty of Ucciali by requesting Italy to represent Abyssinia at the Brussels anti-slavery conference, an act which strengthened Italian illusions as to Menelek's readiness to submit to their protectorate. Menelek had previously notified the chief European Powers of his coronation at Entotto (14th December 1889), but Germany and Great Britain replied that such notification should have been made through the Italian Government. Germany, moreover, wounded Menelek's pride by employing merely the title of "highness." The negus took advantage of the incident to protest against the Italian text of article 17, and to contend that the Amharic text contained no equivalent for the word "*consent*," but merely stipulated that Abyssinia "*might*" make use of Italy in her relations with foreign Powers. On 28th October 1890 Count Antonelli, negotiator of the treaty, was despatched to settle the controversy, but on arriving at Addis Abbaba, the new residence of the negus, found agreement impossible either with regard to the frontier or the protectorate. After protracted negotiations, during which Antonelli was induced to sign a draft treaty apparently arranging for the delimitation of the Italo-Abyssinian boundary and for the maintenance of article 17 with the original discrepancy between the Italian and Amharic texts, the Italian plenipotentiary, finding that he had again been duped, repudiated his signature and left Addis Abbaba in haste (February 1891). On 10th April Menelek communicated to the Powers his views with regard to the Italian frontier, and announced his intention of re-establishing the ancient boundaries of Ethiopia as far as Khartum to the north-west and Victoria Nyanza to the south. Meanwhile the Marquis di Rudini, who had succeeded Crispi as Italian premier, had authorized the abandonment of article 17 even before he had heard of the failure of Antonelli's negotiations. Rudini was glad to leave the whole dispute in abeyance and to make with the local ras, or chieftains, of the high plateau an arrangement securing for Italy the cis-Mareb provinces of Seraè and Okulè-Kusai under the rule of an allied native chief named Bath-Agos.

First Crispi Cabinet.

The period 1887–90 was marked in Italy by great political activity. The entry of Crispi into the Depretis cabinet as minister of the interior (4th April 1887) introduced into the Government an element of vigour which had long been lacking. Though sixty-eight years of age, Crispi possessed an activity, a rapidity of decision, and an energy in execution with which none of his contemporaries could vie. Within four months the death of Depretis (29th July 1887) opened for Crispi the way to the premiership. Besides assuming the presidency of the council of ministers and retaining the ministry of the interior, Crispi took over the portfolio of foreign affairs which Depretis had held since the resignation of Count di Robilant. One of the first questions with which he had to deal was that of conciliation between Italy and the Vatican. At the end of May the pope, in an allocution to the cardinals, had spoken of Italy in terms of unusual cordiality, and had expressed a wish for peace. A few days later Signor Bonghi, one of the framers of the Law of Guarantees, published in the *Nuova Antologia* a plea for reconciliation on the basis of an amendment to the Law of Guarantees and recognition by the pope of the Italian title to Rome. The chief incident of the movement towards conciliation consisted, however, in the publication of a pamphlet entitled *La Conciliazione* by Father Tosti, a close friend and confidant of the pope, extolling the advantages of peace between Vatican and Quirinal. Tosti's pamphlet was known to represent papal ideas, and Tosti himself was *persona grata* to the Italian Government. Reconciliation seemed within sight when suddenly Tosti's pamphlet was placed on the Index, ostensibly on account of a phrase, "The whole of Italy entered Rome by the breach of Porta Pia; the king cannot restore Rome to the pope, since Rome belongs to the Italian people." On 4th June 1887 the official Vatican organ, the *Osservatore Romano*, published a letter written by Tosti to the pope conditionally retracting the views expressed in the pamphlet. The letter had been written at the pope's request, on the understanding that it should not be published. On 15th June the pope addressed to Cardinal Rampolla del Tindaro, secretary of state, a letter reiterating in uncompromising terms the papal claim to the temporal power, and at the end of July Cardinal Rampolla reformulated the same claim in a circular to the papal nuncios abroad. The dream of conciliation was at an end, but the Tosti incident had served once more to illustrate the true position of the Vatican in regard to Italy. It became clear that neither the influence of the regular clergy, of which the Society of Jesus is the most powerful embodiment, nor that of foreign clerical parties, which largely control the Peter's Pence fund, would ever permit renunciation of the papal claim to temporal power. France, and the French Catholics especially, feared lest conciliation should diminish the reliance of the Vatican upon France, and consequently French hold over the Vatican. The Vatican, for its part, felt its claim to temporal power to be too valuable a pecuniary asset and too efficacious an instrument of Church discipline lightly to be thrown away. The legend of an "imprisoned pope," subject to every whim of his gaolers, had never failed to arouse the pity and loosen the purse-strings of the faithful;

Tosti and conciliation.

Terms of the "Roman Question."

dangerous innovators and would-be reformers within the Church could be compelled to bow before the symbol of the temporal power, and their spirit of submission tested by their readiness to forego the realization of their aims until the head of the Church should be restored to his rightful domain. More important than all was the interest of the Roman Curia, composed almost exclusively of Italians, to retain in its own hands the choice of the pontiff and to maintain the predominance of the Italian element and the Italian spirit in the ecclesiastical hierarchy. Conciliation with Italy would expose the pope and his Italian *entourage* to suspicion of being unduly subject to Italian political influence—of being, in a word, more Italian than Catholic. Such a suspicion would inevitably lead to a movement in favour of the internationalization of the Curia and of the papacy. In order to avoid this danger it was therefore necessary to refuse all compromise, and, by perpetual reiteration of a claim incompatible with Italian territorial unity, to prove to the Church at large that the pope and the Curia were more Catholic than Italian. Such rigidity of principle need not be extended to the affairs of everyday contact between the Vatican and the Italian authorities, with regard to which, indeed, a tacit *modus vivendi* was easily attainable. Italy, for her part, could not go back upon the achievements of the Risorgimento by restoring Rome or any portion of Italian territory to the pope. She had hoped by conciliation to arrive at an understanding which should have ranged the Church among the conservative and not among the disruptive forces of the country, but she was keenly desirous to retain the papacy as a preponderatingly Italian institution, and was ready to make whatever formal concessions might have appeared necessary to reassure foreign Catholics concerning the reality of the pope's spiritual independence. The failure of the conciliation movement left profound irritation between Vatican and Quirinal, an irritation which, on the Vatican side, found expression in vivacious protests and in threats of leaving Rome; and, on the Italian side, in the deposition of the syndic of Rome for having visited the cardinal-vicar, in the anti-clerical provisions of the new Penal Code, and in the inauguration (9th June 1889) of a monument to Giordano Bruno on the very site of his martyrdom.

The internal situation inherited by Crispi from Depretis was no sinecure. Extravagant expenditure on railways and public works, loose administration of finance, the cost of colonial enterprise, the growing demands for the army and navy, the impending tariff war with France, and the over-speculation in building and in industrial ventures, which had absorbed all the floating capital of the country, had combined to produce a state of affairs calling for firm and radical treatment. Crispi, burdened by the premiership and by the two most important portfolios in the cabinet, was, however, unable to exercise efficient control over all departments of state. Nevertheless his administration was by no means unfruitful. Zanardelli, minister of justice, secured in June 1888 the adoption of a new Penal Code; state surveillance was extended to the *opere pie*, or charitable institutions; municipal franchise was reformed by granting what was practically manhood suffrage, with residential qualification, provision being made for minority representation; and the central state administration was reformed by a Bill fixing the number and functions of the various ministries. The management of finance was scarcely satisfactory, for though Giolitti, who had succeeded Magliani and Perazzi at the treasury, suppressed the former's illusory "pension fund," he lacked the fibre necessary to deal with the enormous deficit of nearly £10,000,000 in 1888–89, the existence of which both Perazzi and he had recognized. The most successful feature of Crispi's term of office was his strict maintenance of order and the suppression of Radical and Irredentist agitation. So vigorous was his treatment of Irredentism that he dismissed without warning his colleague Seismit Doda, minister of finance, for having failed to protest against Irredentist speeches delivered in his presence at Udine. Firmness such as this secured for him the support of all constitutional elements, and after three years' premiership his position was infinitely stronger than at the outset. The general election of 1890 gave the cabinet an almost unwieldy majority, comprising four-fifths of the Chamber. A lengthy term of office seemed to be opening out before him when, on 31st January 1891, Crispi, speaking in a debate upon an unimportant Bill, angrily rebuked the Right for its noisy interruptions. The rebuke infuriated the Conservative deputies, who, protesting against Crispi's words in the name of the "sacred memories" of their party, precipitated a division and placed the cabinet in a minority. The incident, whether due to chance or guile, brought about the resignation of Crispi. A few days later he was succeeded in the premiership by the Marquis di Rudini, leader of the Right, who formed a coalition cabinet with Nicotera and a part of the Left.

The sudden fall of Crispi wrought a great change in the character of Italian relations with foreign Powers. His policy had been characterized by extreme cordiality towards Austria and Germany, by a close understanding with Great Britain in regard to Mediterranean questions, and by an apparent animosity towards France, which at one moment seemed likely to lead to war. Shortly before the fall of the Depretis–Robilant cabinet Count Robilant had announced the intention of Italy to denounce the commercial treaties with France and Austria, which would lapse on 31st December 1887, and had intimated his readiness to negotiate new treaties. On 24th June 1887, in view of a possible rupture of commercial relations with France, the Depretis–Crispi cabinet introduced a new general tariff. The probability of the conclusion of a new Franco-Italian treaty was small, both on account of the protectionist spirit of France and of French resentment at the renewal of the triple alliance, but even such slight probability vanished after a visit paid to Bismarck by Crispi (October 1887) within three months of his appointment to the premiership. Crispi entertained no *à priori* animosity towards France, but was strongly convinced that Italy must emancipate herself from the position of political dependence on her powerful neighbour which had vitiated the foreign policy of the Left. So far was he from desiring a rupture with France, that he had subordinated acceptance of the portfolio of the interior in the Depretis cabinet to an assurance that the triple alliance contained no provision for offensive warfare. But his ostentatious visit to Friedrichsruh, and a subsequent speech at Turin, in which, while professing sentiments of friendship and esteem for France, he eulogized the personality of Bismarck, aroused against him a hostility on the part of the French which he was never afterwards able to allay. France was equally careless of Italian susceptibilities, and in April 1888 M. Goblet made a futile but irritating attempt to enforce at Massawa the Ottoman *régime* of the capitulations in regard to non-Italian residents. In such circumstances the negotiations for the new commercial treaty could but fail, and though the old treaty was prolonged by special arrangement for two months, differential tariffs were put in force on both sides of the frontier on 29th February 1888. The value of French exports into Italy decreased immediately by one-half, while Italian

Rudini.

exports to France decreased by nearly two-thirds. At the end of 1889 Signor Crispi abolished the differential duties against French imports and returned to the general Italian tariff, but France declined to follow his lead, and maintained her prohibitive dues. Meanwhile the enthusiastic reception accorded to the young German emperor on the occasion of his visit to Rome in October 1888, and the cordiality shown towards King Humbert and Crispi at Berlin in May 1889, increased the tension of Franco-Italian relations; nor was it until after the fall of Prince Bismarck in March 1890 that Crispi adopted towards the Republic a more friendly attitude by sending an Italian squadron to salute President Carnot at Toulon. The chief advantage derived by Italy from Crispi's foreign policy was the increase of confidence in her Government on the part of her allies and of Great Britain. On the occasion of the incident raised by M. Goblet with regard to Massawa, Bismarck made it clear to France that, in case of complications, Italy would not stand alone; and when in February 1888 a strong French fleet appeared to menace the Italian coast, the British Mediterranean squadron demonstrated its readiness to support Italian naval dispositions. Moreover, under Crispi's hand Italy awoke from the apathy of former years and gained consciousness of her place in the world. The conflict with France, the operations in Eritrea, the vigorous interpretation of the triple alliance, the questions of Morocco and Bulgaria, were all used by him as means to stimulate national sentiment. With the instinct of a true statesman, he felt the pulse of the people, divined their need for prestige, and their preference for a Government heavy-handed rather than lax. How great had been Crispi's power was seen by contrast with the policy of the Rudini cabinet which succeeded him in February 1891. Crispi's so-called "megalomania" gave place to retrenchment in home affairs and to a deferential attitude towards all foreign Powers. The premiership of Rudini was hailed by the Radical leader, Cavallotti, as a pledge of the non-renewal of the triple alliance, against which the Radicals began a vociferous campaign. Their tactics, however, produced a contrary effect, for Rudini, accepting proposals from Berlin, renewed the alliance in June 1891 for a period of twelve years. None of Rudini's public utterances justify the supposition that he assumed office with the intention of allowing the alliance to lapse on its expiry in May 1892; indeed, he frankly declared it to form the basis of his foreign policy. The attitude of several of his colleagues was more equivocal, but though they coquetted with French financiers in the hope of obtaining the support of the Paris Bourse for Italian securities, the precipitate renewal of the alliance destroyed all probability of a close understanding with France. The desire of Rudini to live on the best possible terms with all Powers was further evinced in the course of a visit paid to Monza by M. de Giers in October 1891, when the Russian statesman was apprised of the entirely defensive nature of Italian engagements under the triple alliance. At the same time he carried to a successful conclusion negotiations begun by Crispi for the renewal of commercial treaties with Austria and Germany upon terms which to some extent compensated Italy for the reduction of her commerce with France, and concluded with Great Britain conventions for the delimitation of British and Italian spheres of influence in north-east Africa. In home affairs his Administration was weak and vacillating, nor did the economies effected in naval and military expenditure and in other departments suffice to strengthen the position of a cabinet which had disappointed the hopes of its supporters. On 14th April 1892 dissensions between ministers concerning the financial programme led to a cabinet crisis, and though Rudini succeeded in reconstructing his administration, he was defeated in the Chamber on 5th May and obliged to resign. King Humbert, who, from lack of confidence in Rudini, had declined to allow him to dissolve parliament, entrusted Signor Giolitti, a Piedmontese deputy, sometime treasury minister in the Crispi cabinet, with the formation of a ministry of the Left, which contrived to obtain six months' supply on account, and dissolved the Chamber.

Second renewal of the Triple Alliance.

Giolitti.

The ensuing general election (November 1892), marked by unprecedented violence and abuse of official pressure upon the electorate, fitly ushered in what proved to be the most unfortunate period of Italian history since the completion of national unity. The influence of Giolitti was based largely upon the favour of a court clique, and especially of Rattazzi, minister of the royal household. Early in 1893 a scandal arose in connexion with the management of state banks, and particularly of the Banca Romana, whose managing director, Signor Tanlongo, had issued £2,500,000 of duplicate bank-notes. Giolitti scarcely improved matters by creating Tanlongo a member of the Senate, and by denying in parliament the existence of any mismanagement. The Senate, however, manifested the utmost hostility to Tanlongo, whom Giolitti, in consequence of an interpellation in the Chamber, was compelled to arrest. Arrests of other prominent persons followed, and on 3rd February the Chamber authorized the prosecution of De Zerbi, a Neapolitan deputy accused of corruption. On 20th February De Zerbi suddenly expired. For a time Giolitti successfully opposed inquiry into the conditions of the state banks, but on 21st March was compelled to sanction an official investigation by a parliamentary commission composed of seven members. On 23rd November the report of the commission was read to the Chamber amid intense excitement. It established that all Italian cabinets since 1880 had grossly neglected the state banks; that the two preceding cabinets had been aware of the irregularities committed by Tanlongo; that Tanlongo had heavily subsidized the press, paying as much as £20,000 for that purpose in 1888 alone; that a number of deputies, including several ex-ministers, had received from him loans of a considerable amount, which they had apparently made no effort to refund; that Giolitti had deceived the Chamber with regard to the state banks, and was open to suspicion of having, after the arrest of Tanlongo, abstracted a number of documents from the latter's papers before placing the remainder in the hands of the judicial authorities. In spite of the gravity of the charges formulated against many prominent men, the report merely "deplored" and "disapproved" of their conduct, without proposing penal proceedings. Fear of extending still farther a scandal which had already attained huge dimensions, and the desire to avoid any further shock to national credit, convinced the commissioners of the expediency of avoiding a long series of prosecutions. The report, however, sealed the fate of the Giolitti cabinet, and on 24th November it resigned amid general execration.

Bank scandals.

Apart from the lack of scruple manifested by Giolitti in the bank scandals, he exhibited incompetence in the conduct of foreign and home affairs. On 16th and 18th August 1893 a number of Italian workmen were massacred at Aigues-Mortes. The French authorities, under whose eyes the massacre was perpetrated, did nothing to prevent or repress it, and the mayor of Marseilles even refused to admit the wounded Italian workmen to the municipal

Aigues-Mortes massacre.

hospital. These occurrences provoked anti-French demonstrations in many parts of Italy, and revived the chronic Italian rancour against France. The Italian foreign minister, Signor Brin, began by demanding the punishment of the persons guilty of the massacre, but hastened to accept as satisfactory the anodyne measures adopted by the French Government. Giolitti removed the prefect of Rome for not having prevented an expression of popular anger, and presented formal excuses to the French consul at Messina for a demonstration against that consulate. In the following December the French tribunal at Angoulême acquitted all the authors of the massacre. At home Signor Giolitti displayed the same weakness. Riots at Naples in August 1893 and symptoms of unrest in Sicily found him, as usual, unprepared and vacillating. The closing of the French market to Sicilian produce, the devastation wrought by the phylloxera, and the decrease of the sulphur trade had combined to produce in Sicily a discontent of which Socialist agitators took advantage to organize the workmen of the towns and the peasants of the country into groups known as *fasci*. The movement had no well-defined object. Here and there it was based upon a bastard Socialism, in other places it was made a means of municipal party warfare under the guidance of the local maffia, and in some districts it was simply popular effervescence against the local octrois on bread and flour. As early as January 1893 a conflict had occurred between the police and the populace, in which several men, women, and children were killed, an occurrence used by the agitators further to inflame the populace. Instead of maintaining a firm policy, Giolitti allowed the movement to spread until, towards the autumn of 1893, he became alarmed and drafted troops into the island, though in numbers insufficient to restore order. At the moment of his fall the movement assumed the aspect of an insurrection, and during the interval between his resignation (24th November) and the formation of a new Crispi cabinet (10th December) conflicts between the public forces and the rioters were frequent. The return of Crispi to power—a return imposed by public opinion as that of the only man capable of dealing with the desperate situation—marked the turning-point of the crisis. Intimately acquainted with the conditions of his native island, Crispi adopted efficacious remedies. The *fasci* were suppressed, Sicily was filled with troops, the reserves were called out, a state of siege proclaimed, military courts instituted, and the whole movement crushed in a few weeks. The chief agitators were either sentenced to heavy terms of imprisonment or were compelled to flee the country. A simultaneous insurrection at Massa-Carrara was crushed with similar vigour. Crispi's methods aroused great outcry in the Radical press, but the severe sentences of the military courts were in time tempered by the royal prerogative of amnesty.

Insurrection in Sicily.

But it was not alone in regard to public order that heroic measures were necessary. The financial situation inspired serious misgivings. While engagements contracted by Depretis in regard to public works had more than neutralized the normal increase of revenue from taxation, the whole credit of the state had been affected by the severe economic and financial crises of the years 1889–93. The state banks, already hampered by maladministration, were encumbered by huge quantities of real estate which had been taken over as compensation for unredeemed mortgages. Baron Sidney Sonnino, minister of finance in the Crispi cabinet, found a prospective deficit of £7,080,000, and in spite of economies was obliged to face an actual deficit of more than £6,000,000. Drastic measures were necessary to limit expenditure and to provide new sources of revenue. Sonnino applied, and subsequently amended, the Bank Reform Bill passed by the previous Administration (10th August 1893) for the creation of a supreme state bank, the Bank of Italy, which was entrusted with the liquidation of the insolvent Banca Romana. The new law forbade the state banks to lend money on real estate, limited their powers of discounting bills and securities, and reduced the maximum of their paper currency. In order to diminish the gold premium, which under Giolitti had risen to 16 per cent., forced currency was given to the existing notes of the banks of Italy, Naples, and Sicily, while special state notes were issued to meet immediate currency needs. Measures were enforced to prevent Italian holders of consols from sending their coupons abroad to be paid in gold, with the result that, whereas in 1893 £3,240,000 had been paid abroad in gold for the service of the January coupons and only £680,000 in paper in Italy, the same coupon was paid a year later with only £1,360,000 abroad and £2,540,000 at home. Economies for more than £1,000,000 were immediately effected, taxes, calculated to produce £2,440,000, were proposed to be placed upon land, incomes, salt, and corn, while the existing income-tax upon consols (fixed at 8 per cent. by Cambray-Digny in 1868, and raised to 13·20 per cent. by Sella in 1870) was increased to 20 per cent. irrespectively of the stockholders' nationality. These proposals met with opposition so fierce as to cause a cabinet crisis, but Sonnino, who resigned office as minister of finance, returned to power as minister of the treasury, promulgated some of his proposals by royal decree, and in spite of vehement opposition secured their ratification by the Chamber. The tax upon consols, which, in conjunction with the other severe fiscal measures, was regarded abroad as a pledge that Italy intended at all costs to avoid bankruptcy, caused a rise in Italian stocks. When the Crispi cabinet fell in March 1896 Sonnino had the satisfaction of seeing revenue increased by £3,400,000, expenditure diminished by £2,800,000, the gold premium reduced from 16 to 5 per cent., consolidated stock at 95 instead of 72, and, notwithstanding the expenditure necessitated by the Abyssinian war, financial equilibrium practically restored.

Financial crisis.

While engaged in restoring order and in supporting Sonnino's courageous struggle against bankruptcy, Crispi became the object of fierce attacks from the Radicals, Socialists, and Anarchists. On 16th June an attempt by an anarchist named Lega was made on Crispi's life; on 24th June President Carnot was assassinated by the anarchist Caserio; and on 30th June an Italian journalist was murdered at Leghorn for a newspaper attack upon anarchism—a series of outrages which led the Government to frame and parliament to adopt (11th July) a Public Safety Bill for the prevention of anarchist propaganda and crime. At the end of July the trial of the persons implicated in the Banca Romana scandal revealed the fact that among the documents abstracted by Giolitti from the papers of the bank manager, Tanlongo, were several bearing upon Crispi's political and private life. On 11th December Giolitti laid these and other papers before the Chamber, in the hope of ruining Crispi, but upon examination most of them were found to be worthless, and the rest of so private a nature as to be unfit for publication. The effect of the incident was rather to increase detestation of Giolitti than to damage Crispi. The latter, indeed, prosecuted the former for libel and for abuse of his position when premier, but after many vicissitudes, including the flight of Giolitti to Berlin in order to avoid arrest, the Chamber refused authorization for the

Attacks on Crispi.

prosecution, and the matter dropped. A fresh attempt of the same kind was then made against Crispi by the Radical leader Cavallotti, who advanced unproven charges of corruption and embezzlement. These attacks were, however, unavailing to shake Crispi's position, and in the general election of May 1895 his Government obtained a majority of nearly 200 votes. Nevertheless public confidence in the efficacy of the parliamentary system and in the honesty of politicians was seriously diminished by these unsavoury occurrences, which, in combination with the acquittal of all the defendants in the Banca Romana trial and the abandonment of the proceedings against Giolitti, reinforced to an alarming degree the propaganda of the revolutionary parties.

The foreign policy of the second Crispi Administration, in which the portfolio of foreign affairs was held by Baron Blanc, was, as before, marked by a cordial interpretation of the triple alliance and by close accord with Great Britain. A strong Italian squadron took part in the opening of the North Sea Canal at Kiel, and in the Armenian question Italy seconded with energy the diplomacy of Austria and Germany, while the Italian fleet joined the British Mediterranean squadron in a demonstration off the Syrian coast. Graver than any foreign question were the complications in Eritrea. Under the arrangement concluded in 1891 by Rudini with native chiefs in regard to the Italo-Abyssinian frontier districts, relations with Abyssinia had remained comparatively satisfactory. Towards the Sudan, however, the Mahdists, who had recovered from a defeat inflicted by an Italian force at Agordat in 1890, resumed operations in December 1893. Colonel Arimondi, commander of the colonial forces in the absence of the military governor, General Baratieri, attacked and routed a dervish force 10,000 strong on 21st December. The Italian troops, mostly native levies, numbered only 2200 men. The dervish loss was more than 1000 killed, while the total Italian casualties amounted to less than 250. General Baratieri, upon returning to the colony, decided to execute a *coup de main* against the dervish base at Kassala, both in order to relieve pressure from that quarter and to preclude a combined Abyssinian and dervish attack upon the colony at the end of 1894. An agreement had been concluded with Great Britain on 15th April 1891, to the effect that, were Kassala occupied by the Italians, the place should be transferred to the Egyptian Government as soon as the latter should be in a position to restore order in the Sudan. Concentrating a little army of 2600 men, Baratieri surprised and captured Kassala on 17th July 1894, and garrisoned the place with native levies under Italian officers. Meanwhile Menelek, jealous of the extension of Italian influence to a part of Somaliland and to the Benadir coast, had, with the support of France and Russia, completed his preparations for asserting his authority as independent suzerain of Ethiopia. On 11th May 1893 he denounced the treaty of Ucciali, but the Giolitti cabinet, absorbed by the bank scandals, paid no heed to his action. Possibly an adroit repetition in favour of Mangashà and against Menelek of the policy formerly followed in favour of Menelek against the negus Johannes might have consolidated Italian influence in Abyssinia by preventing the ascendency of any single chieftain. The Italian Government, however, neglected this opening, and Mangashà came to terms with Menelek. Consequently the efforts of Crispi and his envoy, Colonel Piano, to conclude a new treaty with Menelek in June 1894 not only proved unsuccessful, but formed a prelude to troubles on the Italo-Abyssinian frontier. Bath-Agos, the native chieftain who ruled the Okulé-Kusai and the cis-Mareb provinces on behalf of Italy, intrigued with Mangashà, ras of the trans-Mareb province of Tigré, and with Menelek, to raise a revolt against Italian rule on the high plateau. In December 1894 the revolt broke out, but Major Toselli with a small force marched rapidly against Bath-Agos, whom he routed and killed at Halai. General Baratieri, governor of Eritrea, having reason to suspect the complicity of Mangashà in the revolt, called upon him to furnish troops for a projected Italo-Abyssinian campaign against the Mahdists. Mangashà made no reply, and Baratieri crossed the Mareb and advanced to Adowa. This movement, intended to overawe the Tigrins, failed in its effect, since Baratieri four days later was obliged to evacuate Adowa and return northwards. Mangashà thereupon took the offensive and attempted to occupy the village of Coatit in Okulé-Kusai, but was forestalled and defeated by Baratieri on 13th January 1895. Hurriedly retreating to Senafé, hard pressed by the Italians, who shelled Senafé on the evening of 15th January, Mangashà was obliged to abandon his camp and provisions to Baratieri, who also secured a quantity of correspondence establishing the complicity of Menelek and Mangashà in the revolt of Bath-Agos.

Complications in Eritrea.

The comparatively facile success achieved by Baratieri against Mangashà seems to have led him to undervalue his enemy, and to forget that Menelek, negus and king of Shoa, had an interest in allowing Mangashà to be crushed, in order that the imperial authority and the superiority of Shoan over Tigrin arms might be the more strikingly asserted. After obtaining the establishment of an apostolic prefecture in Eritrea under the charge of Italian Franciscans, Baratieri expelled from the colony the French Lazarist missionaries for their alleged complicity in the Bath-Agos insurrection, and in March 1895 undertook the conquest of Tigré. Occupying Adigrat and Makallè, he reached Adowa on 1st April, and thence pushed forward to Axum, the holy city of Abyssinia. These places were garrisoned, and during the rainy season Baratieri returned to Italy, where he was received with unbounded enthusiasm. Whether he or the Crispi cabinet had any inkling of the enterprise to which they were committed by the occupation of Tigré is more than doubtful. Certainly Baratieri made no adequate preparations to repel an Abyssinian attempt to reconquer the province. Early in September both Mangashà and Menelek showed signs of activity, and on 20th September Makonnen, ras of Harrar, who up till then had been regarded as a friend and quasi-ally by Italy, expelled all Italians from his territory and marched with 30,000 men to join the negus. On returning to Eritrea, Baratieri mobilized his native reserves and pushed forward columns under Major Toselli and General Arimondi as far south as Amba Alagi. Mangashà fell back before the Italians, who obtained several minor successes; but on 6th December Toselli's column, 2000 strong, which through a misunderstanding continued to hold Amba Alagi, was almost annihilated by the Abyssinian vanguard of 40,000 men. Toselli and all but three officers and 300 men fell at their posts after a desperate resistance. Arimondi, collecting the survivors of the Toselli column, retreated to Makallè and Adigrat. At Makallè, however, he left a small garrison in the fort, which on 7th January was invested by the Abyssinian army. Repeated attempts to capture the fort having failed, Menelek and Makonnen opened negotiations with Baratieri for its capitulation, and on 21st January the garrison, under Major Galliano, who had heroically defended the position, were permitted to march out with the honours of war. Meanwhile Baratieri received reinforcements from Italy, but remained

Conquest of Tigré.

undecided as to the best plan of campaign. Thus a month was lost, during which the Abyssinian army advanced to Hausen, a position slightly south of Adowa. The Italian commander attempted to treat with Menelek, but his negotiations merely enabled the Italian envoy, Major Salsa, to ascertain that the Abyssinians were nearly 100,000 strong, mostly armed with rifles and well supplied with artillery. The Italians, including camp-followers, numbered less than 25,000 men, a force too small for effective action, but too large to be easily provisioned at 200 miles from its base, in a roadless, mountainous country, almost devoid of water. For a moment Baratieri thought of retreat, especially as the hope of creating a diversion from Zeila towards Harrar had failed in consequence of the British refusal to permit the landing of an Italian force without the consent of France. The defection of a number of native allies (who, however, were attacked and defeated by Colonel Stevani on 18th February) rendered the Italian position still more precarious, but Baratieri, unable to make up his mind, continued to manœuvre in the hope of drawing an Abyssinian attack. These futile tactics exasperated the home Government, which on 22nd February despatched General Baldissera, with strong reinforcements, to supersede Baratieri. On 25th February Crispi telegraphed to Baratieri, denouncing his operations as "military phthisis," and urging him to decide upon some strategic plan. Baratieri, anxious probably to obtain some success before the arrival of Baldissera, and alarmed by the rapid diminution of his stores, which precluded further immobility, called a council of war (29th February) and obtained the approval of the divisional commanders for a plan of attack. During the night the army advanced towards Adowa in three divisions, under Generals Dabormida, Arimondi, and Albertone, each division being between 4000 and 5000 strong, and a brigade 5300 strong, under General Ellena, remaining in reserve. All the divisions, save that of Albertone, consisted chiefly of Italian troops. During the march Albertone's native division mistook the road, and found itself obliged to delay the Arimondi column by retracing its steps. Marching rapidly, however, Albertone outdistanced the other columns, but, in consequence of allowing his men an hour's rest, arrived upon the scene of action when the Abyssinians, whom it had been hoped to surprise at dawn, were ready to receive the attack. Pressed by overwhelming forces, the Italians, after a violent combat, began to give way. The Dabormida division, unsupported by Albertone, found itself likewise engaged in a separate combat against superior numbers. Similarly the Arimondi brigade was attacked by 30,000 Shoans, and encumbered by the *débris* of Albertone's troops. Baratieri vainly attempted to push forward the reserve, but the Italians were already overwhelmed, and the battle—or rather, series of distinct engagements—ended in a general rout. The Italian loss is estimated to have been more than 6000, of whom 3125 were whites. Between 3000 and 4000 prisoners were taken by the Abyssinians, including General Albertone, while Generals Arimondi and Dabormida were killed and General Ellena wounded. The Abyssinians lost more than 5000 killed and 8000 wounded. Baratieri, after a futile attempt to direct the retreat, fled in haste and reached Adi-Cajè before the *débris* of his army. Thence he despatched telegrams to Italy throwing blame for the defeat upon his troops, a proceeding which subsequent evidence proved to be as unjustifiable as it was unsoldierlike. Placed under court-martial for his conduct, Baratieri was acquitted of the charge of having been led to give battle by other than military considerations, but the sentence "deplored that in such difficult circumstances the command should have been given to a general so inferior to the exigencies of the situation."

Battle of Adowa.

In Italy the news of the defeat of Adowa caused deep discouragement and dismay. On 5th March the Crispi cabinet resigned before an outburst of indignation which the Opposition had assiduously fomented, and five days later a new cabinet was formed by General Ricotti, who, however, made over the premiership to the Marquis di Rudini. The latter, though leader of the Right, had long been intriguing with Cavallotti, leader of the Extreme Left, to overthrow Crispi, but without the disaster of Adowa his plan would scarcely have succeeded. The first act of the new cabinet was to confirm instructions given by its predecessor to General Baldissera (who had succeeded General Baratieri on 2nd March) to treat for peace with Menelek if he thought desirable. Baldissera opened negotiations with the negus through Major Salsa, and simultaneously reorganized the Italian army. The negotiations having failed, he marched to relieve the beleaguered garrison of Adigrat; but Menelek, discouraged by the heavy losses at Adowa, broke up his camp and returned southwards to Shoa. At the same time Baldissera detached Colonel Stevani with four native battalions to relieve Kassala, then hard pressed by the Mahdists. Kassala was relieved on 1st April, and Stevani a few days later severely defeated the dervishes at Mount Mokram and Tucruff. Returning from Kassala (which Italy decided to hold until it could be transferred to the Anglo-Egyptian forces then moving towards Dongola), Colonel Stevani rejoined Baldissera, who on 4th May relieved Adigrat after a well-executed march. By adroit negotiations with Mangashà the Italian general obtained the release of all the Italian prisoners in Tigré, and towards the end of May withdrew his whole force north of the Mareb. Active hostilities over, most of the Italian troops were ordered home; and after a fruitless attempt by the pope to induce Menelek to release the Italian prisoners in the Shoa province, Major Nerazzini was despatched as special envoy to the negus to arrange terms of peace. On 26th October Nerazzini succeeded in concluding, at Addis Abbaba, a provisional treaty abolishing the treaty of Ucciali; recognizing the absolute independence of Eritrea; postponing for one year the definitive delimitation of the Italo-Abyssinian boundary, but allowing the Italians meanwhile to hold the strong Mareb–Belesa–Muna line; and arranging for the release of the Italian prisoners after ratification of the treaty in exchange for an indemnity of which the amount was to be fixed by the Italian Government. The treaty having been duly ratified, and an indemnity of £400,000 paid to Menelek, the Shoan prisoners were released, and Major Nerazzini once more returned to Abyssinia with instructions to secure, if possible, Menelek's assent to the definitive retention of the Mareb–Belesa–Muna line by Italy. Before Nerazzini could reach Addis Abbaba, Rudini, in order partially to satisfy the demands of his Radical supporters for the abandonment of the colony, announced in the Chamber the intention of Italy to limit her occupation to the triangular zone between the points Asmarà, Keren, and Massawa, and, possibly, to withdraw to Massawa alone. This declaration, of which Menelek was swiftly apprised by French agents, rendered it impossible for Nerazzini to obtain more than a boundary leaving to Italy but a small portion of the high plateau and ceding to Abyssinia the fertile provinces of Seraè and Okulé-Kusai. The fall of the Rudini cabinet in June 1898, however, enabled Signor Ferdinando Martini and Captain Cicco di Cola, who had been appointed respectively civil

Abyssinian settlement.

governor of Eritrea and minister resident at Addis Abbaba, to prevent the cession of Seraè and Okulé-Kusai, and to secure the assent of Menelek to Italian retention of the Mareb–Belesa–Muna frontier. Eritrea has now approximately the same extent as before the revolt of Bath-Agos, except in regard (1) to Kassala, which was transferred to the Anglo-Egyptian authorities on 25th December 1897, in pursuance of the above-mentioned Anglo-Italian convention; and (2) to slight rectifications of its northern and eastern boundaries by conventions recently concluded between the Eritrean and the Anglo-Egyptian authorities. Under Signor Ferdinando Martini's able administration the cost of the colony to Italy has been reduced to £260,000 per annum, its trade and agriculture have vastly improved, and the discovery of gold in the neighbourhood of Asmarà now justifies the hope that it may ere long become a source of profit to Italy.

While marked in regard to Eritrea by vacillation and undignified readiness to yield to Radical clamour, the policy of the Marquis di Rudini was in other respects chiefly characterized by a desire to demolish Crispi and his supporters. Actuated by rancour against Crispi, he on 29th April 1896 authorized the publication of a Green Book on Abyssinian affairs, in which, without the consent of Great Britain, the confidential Anglo-Italian negotiations in regard to the Abyssinian war were disclosed. This publication, which amounted to a gross breach of diplomatic confidence, might have endangered the cordiality of Anglo-Italian relations, had not the esteem of the British Government for General Ferrero, Italian ambassador in London, induced it to overlook the incident. Fortunately for Italy, the Marquis Visconti Venosta shortly afterwards consented to assume the portfolio of foreign affairs, which had been resigned by Duke Caetani di Sermoneta, and again to place, after an interval of twenty years, his unrivalled experience at the service of his country. In September 1896 he succeeded in concluding with France a treaty with regard to Tunis in place of the old Italo-Tunisian treaty, denounced by the French Government a year previously. During the Greco-Turkish war of 1897 Visconti Venosta laboured to maintain the European concert, joined Great Britain in preserving Greece from the worst consequences of her folly, and lent moral and material aid in establishing an autonomous government in Crete. At the same time he mitigated the Francophil tendencies of some of his colleagues, accompanied King Humbert and Queen Margherita on their visit to Homburg in September 1897, and, by loyal observance of the spirit of the triple alliance, retained for Italy the confidence of her allies without forfeiting the goodwill of France.

The home administration of the Rudini cabinet compared unfavourably with that of foreign affairs. Bound by a secret understanding with the Radical leader Cavallotti, an able but unscrupulous demagogue, Rudini was compelled to bow to Radical exigencies. He threw all the influence of the Government against Crispi, who was charged with complicity in embezzlements perpetrated by Favilla, managing director of the Bologna branch of the Bank of Naples. After being subjected to persecution for nearly two years, Crispi's character was substantially vindicated by the report of a parliamentary commission appointed to inquire into his relations with Favilla. True, the commission proposed and the Chamber adopted a vote of censure upon Crispi's conduct in 1894, when, as premier and minister of the interior, he had borrowed £12,000 from Favilla to replenish the secret service fund, and had subsequently repaid the money as instalments for secret service were in due course furnished by the treasury. Though irregular, his action was to some extent justified by the depletion of the secret service fund under Giolitti and by the abnormal circumstances prevailing in 1893–94, when he had been obliged to quell the insurrections in Sicily and Massa-Carrara. But the Rudini–Cavallotti alliance was destined to produce other results than those of the campaign against Crispi. Pressed by Cavallotti, Rudini in March 1897 dissolved the Chamber and conducted the general election in such a way as to crush by Government pressure the partisans of Crispi, and greatly to strengthen the (Socialist, Republican, and Radical) revolutionary parties. More than ever at the mercy of the Radicals and of their revolutionary allies, Rudini continued so to administer public affairs that subversive propaganda and associations obtained unprecedented extension. The effect was seen in May 1898, when, in consequence of a rise in the price of bread, disturbances occurred in southern Italy. The corn duty was reduced to meet the emergency, but the disturbed area extended to Naples, Foggia, Bari, Minervino-Murge, Molfetta, and thence along the line of railway which skirts the Adriatic coast. At Faenza, Piacenza, Cremona, Pavia, and Milan, where subversive associations were stronger, it assumed the complexion of a political revolt. From 7th to 9th May Milan remained practically in the hands of the mob. A palace was sacked, barricades were erected, and for forty-eight hours the troops under General Bava-Beccaris, notwithstanding the employment of artillery, were unable to restore order. In view of these occurrences, Rudini authorized the proclamation of a state of siege at Milan, Florence, Leghorn, and Naples, delegating the suppression of disorder to special military commissioners. By these means order was restored, though not without considerable loss of life at Milan and elsewhere. At Milan alone the official returns confessed to eighty killed and several hundred wounded, a total generally considered below the real figures. As in 1894, excessively severe sentences were passed by the military tribunals upon revolutionary leaders and other persons considered to have been implicated in the outbreak, but successive royal amnesties obliterated these condemnations within three years.

Riots of May, 1898.

No Italian administration since the death of Depretis underwent so many metamorphoses as that of the Marquis di Rudini. Modified a first time within five months of its formation (July 1896) in connexion with General Ricotti's Army Reform Bill, and again in December 1897, when Zanardelli entered the cabinet, it was reconstructed for a third time at the end of May 1898 upon the question of a Public Safety Bill, but fell for the fourth and last time on 18th June 1898, on account of public indignation at the results of Rudini's home policy as exemplified in the May riots. On 29th June Rudini was succeeded in the premiership by General Luigi Pelloux, a Savoyard, whose only title to office was the confidence of the king. The Pelloux cabinet possessed no clear programme except in regard to the Public Safety Bill, which it had taken over from its predecessor. Presented to parliament in November 1898, the Bill was read a second time in the following spring, but its third reading was violently obstructed by the Socialists, Radicals, and Republicans of the Extreme Left. After a series of scenes and scuffles the Bill was promulgated by royal decree, the decree being post-dated to allow time for the third reading. Again obstruction precluded debate, and on 22nd July 1899 the decree automatically acquired force of law, pending the adoption of a Bill of indemnity by the Chamber. In February 1900 it was, however, quashed by the supreme court on a point of procedure, and the Public Safety Bill

Pelloux and obstruction.

as a whole had again to be presented to the Chamber. In view of the violence of Extremist obstruction, an effort was made to reform the standing orders of the Lower House, but parliamentary feeling ran so high that General Pelloux thought it expedient to appeal to the country. The general election of June 1900 not only failed to reinforce the cabinet, but largely increased the strength of the extreme parties (Radicals, Republicans, and Socialists), who in the new Chamber numbered nearly 100 out of a total of 508. General Pelloux therefore resigned, and on 24th June a Moderate Liberal cabinet was formed by the aged Signor Saracco, president of the Senate. Within five weeks of its formation King Humbert was shot by an anarchist assassin named Bresci while leaving an athletic festival at Monza, where his Majesty had distributed the prizes (29th July 1900). The death of the unfortunate monarch, against whom an attempt had previously been made by the anarchist Acciarito (22nd April 1897), caused an outburst of profound sorrow and indignation. Though not a great monarch, King Humbert had, by his unfailing generosity and personal courage, won the esteem and affection of his people. During the cholera epidemic at Naples and Busca in 1884, and the Ischia earthquake of 1885, he, regardless of danger, brought relief and encouragement to sufferers, and rescued many lives. More than £100,000 of his civil list was annually devoted to charitable purposes. Humbert was succeeded by his only son, Victor Emmanuel III. (born 11th November 1869), a liberal-minded and well-educated prince, who at the time of his father's assassination was returning from a cruise in the eastern Mediterranean. The remains of King Humbert were laid to rest in the Pantheon at Rome beside those of his father, Victor Emmanuel II. (9th August). Two days later Victor Emmanuel III. swore fidelity to the constitution before the assembled Houses of Parliament and in the presence of his consort, Elena of Montenegro, whom he had married in October 1896. During the first year of the new reign (1st June 1901) the royal household was gladdened by the birth of a princess, named Yolanda Margherita of Savoy.

Death of King Humbert.

Accession of King Victor Emmanuel III.

The later course of Italian foreign policy was marked by many vicissitudes. Admiral Canevaro, who had gained distinction as commander of the international forces in Crete (1896–98), assumed the direction of foreign affairs in the first period of the Pelloux administration. His diplomacy, though energetic, lacked steadiness. Soon after taking office he completed the negotiations begun by the Rudini administration for a new commercial treaty with France (October 1898), whereby Franco-Italian commercial relations were placed upon a normal footing after a breach which had lasted for more than ten years. By the despatch of a squadron to Central America he obtained satisfaction for injuries inflicted thirteen years previously upon an Italian subject by the United States of Colombia. In December 1898 he convoked a diplomatic conference in Rome to discuss secret means for the repression of anarchist propaganda and crime in view of the assassination of the empress of Austria by an Italian anarchist (Luccheni), but it is doubtful whether results of practical value were achieved. The action of the Tsar of Russia in convening the Peace Conference at The Hague in May 1900 gave rise to a question as to the right of the Vatican to be officially represented, and Admiral Canevaro, supported by Great Britain and Germany, succeeded in preventing the invitation of a papal delegate. Shortly afterwards his term of office was brought to a close by the failure of an attempt to secure for Italy a coaling station at San Mun and a sphere of influence in China; but his policy of active participation in Chinese affairs was continued in a modified form by his successor, the Marquis Visconti Venosta, who, entering the reconstructed Pelloux cabinet in May 1899, retained the portfolio of foreign affairs in the ensuing Saracco administration, and secured the despatch of an Italian expedition, 2000 strong, to aid in repressing the Chinese outbreak and in protecting Italian interests in the Far East (July 1900). With characteristic foresight, Visconti Venosta promoted an exchange of views between Italy and France in regard to the Tripolitan hinterland, which the Anglo-French convention of 1899 had placed within the French sphere of influence—a modification of the *status quo ante* considered highly detrimental to Italian aspirations in Tripoli. For this reason the Anglo-French convention had caused profound irritation in Italy, and had tended somewhat to diminish the cordiality of Anglo-Italian relations. Visconti Venosta is believed, however, to have obtained from France a formal declaration that France would not transgress the limits assigned to her influence by the convention. Similarly, in regard to Albania, Visconti Venosta exchanged notes with Austria with a view to the prevention of any misunderstanding through the conflict between Italian and Austrian interests in that part of the Adriatic coast. Upon the fall of the Saracco cabinet (9th February 1901) Visconti Venosta was succeeded at the foreign office by Signor Prinetti, a Lombard manufacturer, of strong temperament, but without previous diplomatic experience. The new minister continued in most respects the policy of his predecessor. The outset of his administration was marked by Franco-Italian *fêtes* at Toulon (10th to 14th April 1901), when the Italian fleet returned a visit paid by the French Mediterranean squadron to Cagliari in April 1899; and by the despatch of three Italian warships to Prevesa to obtain satisfaction for damage done to Italian subjects by Turkish officials.

Foreign affairs.

The Saracco administration, formed after the obstructionist crisis of 1899–1900 as a cabinet of transition and pacification, was overthrown in February 1901 in consequence of its vacillating conduct towards a dock strike at Genoa. It was succeeded by a Zanardelli cabinet, in which the portfolio of the interior was allotted to Signor Giolitti. Composed mainly of elements drawn from the Left, and dependent for a majority upon the support of the subversive groups of the Extreme Left, the formation of this cabinet gave the signal for a vast working-class movement, during which the Socialist party sought to extend its political influence by means of strikes and the organization of labour leagues among agricultural labourers and artisans. The movement was confined chiefly to the northern and central provinces. During the first six months of 1901 the strikes numbered 600, and involved more than 1,000,000 workmen, many of whom obtained some temporary or permanent increase of pay. Encouraged rather than opposed by the Government, and kept, on the whole, within legal bounds by the Socialists, who had every reason to avoid embarrassing excesses, the movement constituted an important development in the economic and political life of Italy—economic, as marking a strong departure towards labour organization, and political, as proving the ascendancy acquired by the Socialist party, which, though represented by only twenty-eight deputies in the Chamber, threatened to become a dominant factor in Italian politics. A fatal strike riot at Berra, near Ferrara, at the end of June 1901, during which the troops were obliged to use their firearms, induced the Socialists, however, to engage in a campaign against the army, and caused a

Zanardelli-Giolitti Cabinet.

split between the ministerial and anti-ministerial members of the party. The two factions then entered upon a struggle for mastery, the former in the hope of realizing Socialist aims by pacific legislative means, and the latter in order to maintain the violent revolutionary attitude characteristic of Italian Socialism.

After the adoption of heroic measures for the restoration of Italian finance in 1894–95, the condition of the Italian exchequer remained as satisfactory as is possible in a country where interest on national debt absorbs nearly one-half of the total revenue. Income largely increased without further taxation; trade and industry more than recovered from the depression of 1893–94; military expenditure remained stationary at the level of £9,560,000 fixed by the Army Bill of May 1897, while military pensions were consolidated at £1,440,000; the naval estimates, of about £4,000,000 a year, were supplemented by special credits for shipbuilding; banking institutions (including the Bank of Naples, which was saved from failure by an operation effected in 1897 by Signor Luzzatti, treasury minister) greatly strengthened their position, and largely liquidated the enormous quantities of real estate by which they were encumbered through the crisis of 1889–93. Savings banks returns showed satisfactory progress, co-operation in all its forms rapidly developed, and the creation of a State institute for insuring the working classes against illness and destitution marked a step towards the realization of an ideal long entertained by Italian economists and statesmen. Agriculture began slowly to adopt modern methods, though hampered by lack of adequate markets, and suffering more than it could profit by the unwholesome effect of high protective duties. The most serious defects in the public life of Italy were to be found in parliamentary instability and the consequent interference of favour-hunting deputies with the working of State departments, in excessive bureaucracy, and in faulty administration of justice. Nevertheless Italy, with her popular monarchy, comparatively strong defensive organizations, valuable alliances, and sober, intelligent, and industrious people, promised, if honestly and firmly governed, to develop gradually into a strong and prosperous state. Taxation, though heavy, was not unbearable, and the discontent existing in parts of the country was dangerous to the State only in so far as it was fomented by, and served as a handle for, Socialist and Clerical agitators.

(H. W. S.)

LITERATURE SINCE 1880.

The period between 1880 and 1902 is interesting to the student of Italian literature, apart from the intrinsic merit of the writers representing it, chiefly from the fact of its embracing almost the entire literary effort of the younger, and necessarily much altered, generation which sprang up after the unification of Italy. The period was also characterized by the increased impulse towards national culture given to all classes by the new order of things. This impulse took two parallel directions: on the one side we have a return to a deeper and more organized investigation of the first origins and developments of national literature, on the other a tendency to realize more and more broadly the influence of foreign history and of the new currents in foreign literature and research. Therefore, because of this influence exercised by the thought of other nations on the minds of the younger generation, many writers who would otherwise have remained in the sphere of literature pure and simple come to be classed among historical or scientific writers, while for merits of style their achievement is such that they cannot be overlooked even in a purely literary survey of the period. The first name we meet of those still living in 1902 among those who may be called the fathers of the period is that of Giosuè Carducci (*q.v.*), one of the grandest literary and poetic figures of his time. His genius has admirably summed up the two above-mentioned tendencies, insomuch that his poetic production, ranging from 1850 to the publication of a complete edition of his work in 1896, came upon Italy like a burst of fresh life and renewed vigour, while his essays inaugurated a broader, fuller, and in many ways till then unknown method of literary criticism.

The greater part of Carducci's work is anterior to the present period, but he was brought into more fraternal contact with the aims of the younger generation by the efforts of Angelo Sommaruga, who became, about 1880, the publisher of a group of young unknown writers all destined to some, and a few to great, accomplishment. The period of his prosperity was a strange one for Italy. The first ten years of the newly constituted kingdom had passed more in stupor than activity; original contributions to literature had been scarce, and publishers had preferred bringing out inferior translations of not always admirable French authors to encouraging the original work of Italians—work which it must be confessed was generally mediocre and entirely lifeless. Sommaruga's creation, a literary review called *La Cronaca Bizantina*, gathered together such beginners as Giovanni Marradi, Matilde Serao, Edoardo Scarfoglio, Guido Magnoni, and Gabriele d'Annunzio. In order to obtain the sanction of what he considered an enduring name, the founder turned to Giosuè Carducci, then living in retirement at Bologna, discontented with his fate, and still not generally known by the public of his own country. The activity of Sommaruga exercised a great influence on Giosuè Carducci. Within the next few years he published the three admirable volumes of his *Confessioni e Battaglie*, the *Ça Ira* sonnets, the *Nuove Odi Barbari*, and a considerable number of articles, pamphlets, and essays, which in their collected edition form the most living part of his work. His lyrical production, too, seemed to reach its perfection in those five years of tense, unrelenting work; for the *Canzone di Legnano*, the Odes to Rome and to Monte Mario, the Elegy on the urn of Percy Bysshe Shelley, the ringing rhymes of the *Intermezzo*, in which he happily blended the satire of Heine with the lyrical form of his native poetry—all belong to this period, together with the essays on Leopardi and on Parini, the admirable

discussions in defence of his *Ça Ira*, and the pamphlet called *Eterno Femminino regale*, a kind of self-defence, undertaken to explain the origin of the Alcaic metre to the Queen of Italy, which marks the beginning of the last evolution in Carducci's work (1881). The revolutionary spirits of the day, who had always looked upon Giosuè Carducci as their bard and champion, fell away from him after this poem written in honour of a queen, and the poet, wounded by the attitude of his party, wrote what he intended to be his defence and his programme for the future in pages that will remain amongst the noblest and most powerful of contemporary literature. From that time Carducci appears in a new form, evolved afterwards in his last Odes, *Il Piemonte*, *La Bicocca di San Giacomo*, the Ode to the daughter of Francesco Crispi on her marriage, and the one to the church where Dante once prayed, *Alla Chiesetta dei Polenta*, which is like the withdrawing into itself of a warlike soul weary of its battle.

The same qualities which placed Carducci among the classics of Italy in his earlier days remained consistently with him in later life. His thought flows limpid, serene, sure of itself above an undercurrent of sane and vigorous if pagan philosophy. Patriotism, the grandeur of work, the soul-satisfying power of justice, are the poet's dominant ideals. For many years the national struggle for liberty had forced the best there was in heart and brain into the atmosphere of political intrigue and from one battlefield to another; Carducci therefore found a poetry emasculated by the deviation into other channels of the intellectual virility of his country. On this mass of patriotic doggerel, of sickly, languishing sentimentality as insincere as it was inane, he grafted a poetry not often tender, but always violently felt and thrown into a mould of majestic form; not always quite expected or appreciated by his contemporaries, but never commonplace in structure; always high in tone and free in spirit. The adaptation of various kinds of Latin metres to the somewhat sinewless language he found at his disposal, whilst it might have been an effort of mere pedantry in another, was a life-giving and strengthening inspiration in his case. Another of his characteristics, which made him peculiarly precious to his countrymen, is the fact that his poems form a kind of lyric record of the Italian struggle for independence. The tumultuous vicissitudes of all other nations, however, and the pageantry of the history of all times, have in turns touched his particular order of imagination. The more important part of his critical work which belongs to this later period consists of his *Conversazioni Critiche*, his *Storia filosofica della letteratura Italiana*, and a masterly edition of Petrarch. That he should have had the faults of his qualities is not remarkable. Being almost a pioneer in the world of criticism, his essays on the authors of other countries, though appearing in the light of discoveries to his own country, absorbed as it had hitherto been in its own vicissitudes, have little of value to the general student beyond the attraction of robust style. And in his unbounded admiration for the sculptural lines of antique Latin poetry he sometimes relapsed into that fascination by mere sound which is the snare of his language, and against which his own work in its great moments is a reaction.

Fiction in an original form has only revived in Italy since about 1880. Before that time Italian novels, with the solitary exception of *I promessi sposi*, simply did not exist; the demand for fiction seemed amply and dangerously easily satisfied by inept translations from foreign writers, while the authors chosen were seldom those most worthy of translation. The first to shake off this yoke and write on lines of his own was Antonio Fogazzaro (*q.v.*), whose work is traceable to no particular parentage, except in so far as he has directly continued the traditions of Manzoni. His ideal of literary achievement in point of style is simplicity, and the effect thus attained by him is considerable. His chief works are *Daniele Cortis*, *Malombra*, and among the later ones *Piccolo Mondo Antico*, in which the details of the domestic life of a small corner of Italy during the stirring times of her national struggle, with its sharpened emotions and highly-strung aspirations, are presented with extreme vividness and noiselessly woven into genuine drama. Not the least of Fogazzaro's merits is the capacity for delicate humour both in characterization and reflection, which he shares with so few of his contemporaries, or indeed of his countrymen. Fogazzaro is a poet by temperament, with an intense appreciation of the higher emotions in life and art; the personages of his preference in his own work are the simpler souls attracted by singleness of heart and nobility of purpose. He might have won for himself an even greater place in the literature of his country had his medium been a language entirely national and less dialectal.

Giovanni Verga (born 1840) has also contributed some powerful work, inspired from the fierce passions and primitive manners of humble Sicilian life. His two best novels, however, *Malavoglia* and *Mastro Don Gesualdo*, are not his best work, and he will live longest by his short stories (*e.g.*, *Cavalleria Rusticana*). Fogazzaro and Verga faithfully chronicled between them the inner and popular life of northern and southern Italy.

Gabriele d'Annunzio is, however, the Italian writer whose reputation has travelled farthest. Of Dalmatian extraction, he was born at Pescara (Abruzzi) in 1863. The first years of his youth were spent in the freedom of the open fields; at sixteen he was sent to school in Tuscany. While still at school he published a small volume of verses called *Primo Vere* (1879), in which, side by side with some almost brutal imitations of Lorenzo Stecchetti, the then fashionable poet of *Postuma*, were some translations from the Latin, distinguished by such agile grace that Giuseppe Chiarini on reading them brought the unknown youth before the public in an enthusiastic article. The young poet then went to Rome, where he was received as one of their own by the *Cronaca Bizantina* group. Here he published *Canto Nuovo* (1882), *Terra Vergine* (1882), *L' Intermezzo di Rime* (1883), *Il Libro delle Vergini* (1884), and the greater part of the short stories that were afterwards collected under the general title of *San Pantaleone* (1886). In *Canto Nuovo* we have admirable poems full of pulsating youth and the promise of power, some descriptive of the sea and some of the Abruzzi landscape, commented on and completed in prose by *Terra Vergine*, the latter a collection of short stories dealing in radiant language with the peasant life of the author's native province. With the *Intermezzo di Rime* we have the beginning of d'Annunzio's second and characteristic manner. His conception of style was new, and he chose to express all the most subtle vibrations of voluptuous life. Both style and contents began to startle his critics; some who had greeted him as an *enfant prodige*—Chiarini amongst others—rejected him as a perverter of public morals, whilst others hailed him as one bringing a current of fresh air and the impulse of a new vitality into the somewhat prim, lifeless work hitherto produced.

Meanwhile the Review of Angelo Sommaruga perished in the midst of scandal, and his group of young authors found itself dispersed. Some entered the teaching career and were lost to literature, others threw themselves into journalism. Gabriele d'Annunzio took this latter course, and joined the staff of the *Tribuna*. For this paper, under the pseudonym of "Duca Minimo," he did some of his most brilliant work, and the articles he wrote during that period of originality and exuberance would well repay being collected. To this period of greater maturity and deeper culture belongs *Il Libro d' Isotta* (1886), a love poem, in which for the first time he drew inspiration adapted to modern sentiments and passions from the rich colours of the Renaissance. *Il Libro d' Isotta* is interesting also, because in it we find most of the germs of his future work, just as in *Intermezzo melico* and in certain ballads and sonnets we find descriptions and emotions which later went to form the æsthetic contents of *Il Piacere*, *Il Trionfo della Morte*, and *Elegie Romane* (1892).

D'Annunzio's first novel, *Il Piacere*, appeared in 1889, and was followed in 1891 by *L' Innocente*, and in 1892 by *Giovanni Episcopo*. These three novels created a profound impression. *L' Innocente*, admirably translated into French by Georges Herelle, brought its author the notice and applause of foreign critics. His next work, *Il Trionfo della Morte* (1894), was followed at a short distance by *Le Vergini della Roccio* (1896) and *Il Fuoco* (1900), which in its descriptions of Venice is perhaps the most ardent glorification of a city existing in any language.

D'Annunzio's poetic work of this period, in most respects his finest, is represented by *Il Poema Paradisiaco* (1893), the *Odi Navali* (1893), a superb attempt at civic poetry, and *Laudi* (1900).

A later phase of d'Annunzio's work is his dramatic production, represented by *Il Sogno di un mattino di primavera* (1897), a lyrical fantasia in one act; his *Citta Morta* (1898), written for Sarah Bernhardt, which is certainly among the most daring and original of modern tragedies, and the only one which by its unity, persistent purpose, and sense of fate seems to continue in a measure the traditions of the Greek theatre. In 1898 he wrote his *Sogno di un Pomeriggio d'Autunno* and *La Gioconda*; in the succeeding year *La Gloria*, an attempt at contemporary political tragedy which met with no success, probably through the audacity of the personal and political allusions in some of its scenes; and finally *Francesca da Rimini* (1901), a perfect reconstruction of mediæval atmosphere and emotion, magnificent in style, and declared by one of the most authoritative Italian critics—Edoardo Boutet—to be the first real although not perfect tragedy which has ever been given to the Italian theatre.

The work of d'Annunzio, although by many of the younger generation injudiciously and extravagantly admired, is almost the most important literary work given to Italy since the days when the great classics welded her varying dialects into a fixed language. The psychological inspiration of his novels has come to him from many sources—French, Russian, Scandinavian, German—and in much of his earlier work there is little fundamental originality. His creative power is intense and searching, but narrow and personal; his heroes and heroines are little more than one same type monotonously facing a different problem at a different phase of life. But the faultlessness of his style and the wealth of his language have been approached by none of his contemporaries, whom his genius has somewhat paralysed. In his later work, when he begins drawing his inspiration from the traditions of bygone Italy in her glorious centuries, a current of real life seems to run through the veins of his personages. And the lasting merit of d'Annunzio, his real value to the literature of his country, consists precisely in that he opened up the closed mine of its former life as a source of inspiration for the present and of hope for the future, and created a language, neither pompous nor vulgar, drawn from every source and district, suited to the requirements of modern thought yet absolutely classical, borrowed from none, and, independently of the thought it may be used to express, a thing of intrinsic beauty. As his sight became clearer and his purpose strengthened, as exaggerations, affectations, and moods dropped away from his conceptions, his work became more and more typical Latin work, upheld by the ideal of an Italian Renaissance in art and letters.

Some of the most remarkable poetic work between 1890 and 1902 was that of Ada Negri (born 1870) and Pascoli. The former, in her first book of poems, *Tempeste* (1891), tells the helpless tragedy of the forsaken poor and of those whom life has conquered in words of hot, vehement beauty. The promise of more polished form, however, was insufficiently fulfilled in her second work, *Fatalita* (1892), while the violent burst of emotion which startles the reader into admiration in her first poems had a tendency to repeat itself on the same lines, therefore dwindling into a mannerism. Pascoli, a mild and solitary spirit, is best known by his *Myricæ* and *Poemetti*, both poems of domestic life and social ideals.

The next name of importance to fiction we find during this period is that of Matilde Serao (born 1856). She was born at Patrasso, Greece. Her father was a political emigrant, and her mother was a Greek. On returning to Naples she became a schoolmistress, and she afterwards, with truly delicious grace, described those years of laborious poverty in the preface to a book of short stories called *Leggende Napolitane* (1881). But attention was first attracted to her name by her *Novelle*, published in a paper of Rocco de Zerbi's, and later by her first novel, *Fantasia* (1883), which definitely established her as a writer full of feeling and analytical subtlety. She spent the years between 1880 and 1886 in Rome, where she published her next five volumes of short stories and novels, all dealing with ordinary Italian, and especially Roman, life, and distinguished by great accuracy of observation and depth of insight: *Cuore Inferno* (1881), *Fior di Passione* (1883), *La conquista di Roma* (1885), *La Virtu di Checchina* (1884), and *Piccole anime* (1883). She then founded *Il Corriere di Roma*, the first Italian attempt to model a daily journal on the lines of the Parisian press. The paper was short-lived, and when it was given up Matilde Serao established herself in Naples, where she edited *Il Corriere de Napoli*, and later founded *Il Mattino*, which became by 1902 the most important and most widely read daily paper of southern Italy. But the stress of a journalistic career in no way limited her literary activity; in the ten years between 1890 and 1900 she produced *Pasce di Cuccagna*, *Ventre di Napoli*, *Addio Amore*, *All' Erta Sentinella*, *Castigo*, *La Ballerina*, *Suor Giovanna della Croce*, novels in which the character of the people is rendered with minute, sensitive power and sympathetic breadth of spirit.

Matilde Serao's place as a contemporary Italian novelist is one apart: she is a naturalist, but her naturalism should be understood in a much wider sense than that which is generally given to it. She is a naturalist because her books reflect life with the utmost simplicity of means, sometimes with an utter neglect of means, and at the same time she is an idealist through her high sense of the beauty and nobility which humanity can attain, and to which her writings continually aspire. All her work is truly and profoundly Italian; it is the literature of a great mass of individuals, rather than of one peculiarly accentuated individual; the joy and pain of a whole class rather than the perplexities of a unique case or type pulsates through her pages.

Matilde Serao's defects are always defects of style; her want of sufficient choice of detail often clogs the movement of her narrative and mars the artistic effect of her always animated pages. Like Fogazzaro's, her speech is too often the popular speech of her particular province, in description as well as in dialogue.

Among those writers who, although they have produced some works of fiction of considerable merit, cannot, strictly speaking, be termed novelists we may mention Edmondo d'Amicis (born 1846). His best-known books are personal diaries and descriptions of travel, worthy of consideration for a certain limpidity of expression and grace of thought. Enrico Panzacchi (born 1842) is a serious critic and graceful poet; and Felice Cavallotti (born 1842) is the author, among other minor poetry, of the stirring *Marcia de Leonida*.

The activity of this more recent period of Italian literature was manifested quite as much in the field of critical research as in that of artistic creation: Carducci, Alessandro d'Ancona (born 1835), Adolfo Bartoli (born 1833), Alessandro Torraca, and Cassini have done much for the history of Italian literature, while Tivaroni (1812–1872), amongst others, contributed similar work in the service of political and social history. In the realm of synthetic historical reconstruction we find Professor Pasquale Villari (born 1827), with his studies on Machiavelli and Savonarola; Del Lungo (born 1841), with several admirable contributions to the history of Old Florence; Molmenti (born 1852), who has done the same for Venice; Senatore Negri (1809–1896), with his many essays on historical personages; Ruggero Bonghi (1826–1895), whose *Roman History*, admirably

begun, was never carried beyond the first centuries, owing to the preoccupations of political life; Domenico Comparetti (born 1835), to whom we owe some curious studies on Virgil in the Middle Ages; Arturo Graf (born 1848), who has also contributed numerous pamphlets on mediæval studies, besides a learned and interesting work on the various legends of the Devil; and Ferrero, whose first volume of a History of the Greatness and Decadence of Rome (1901) promised to be a work both profound and original.

A characteristic movement of modern Italian literature, brought about by the excessively grave social difficulties that latterly came to be connected with the life of the country, was caused by the extraordinary interest in social studies taken by all classes. It would be impossible not to mention Lombroso's (*q.v.*) studies in criminology, and Loria's (born 1819) studies in economics, precisely because of the great influence they exercised on that section of the general studious public in no way professionally dedicated to such studies, and because such writers on subjects hitherto little dealt with helped to create the style and language most suitable to them, and henceforth adopted. (M. He.)

Ithaca. See Greece: *Ionian Islands.*

Ithaca, capital of Tompkins county, New York, U.S.A., at the head of Cayuga Lake, at an altitude of 389 feet. Most of the city is in the level valley, from which it spreads up the heights on the west. It is on the Lehigh Valley and the Delaware, Lackawanna, and Western railways. It is the seat of Cornell University. Situated in a fertile farming region, its manufactures relate largely to agriculture, and consist in great part of agricultural tools and implements. It was chartered as a city in 1888. Population (1880), 9105; (1890), 11,079; (1900), 13,136—1310 foreign-born and 364 negroes.

Ito Hirobumi, Marquis (1838- ——), Japanese statesman, was born in 1838, being the son of Ito Jûzô, and (like his father) began life as a retainer of the Lord of Choshiu, one of the most powerful nobles of Japan. Choshiu, in common with many of his fellow Daimios, was bitterly opposed to the rule of the Shôgun or Tycoon, and when this rule resulted in the conclusion of the treaty with Commodore Perry in 1854, the smouldering discontent broke out into open hostility against both parties to the compact. In these views Ito cordially agreed with his chieftain, and was sent on a secret mission to Yedo to report to his lord on the doings of the Government. This visit had the effect of causing Ito to turn his attention seriously to the study of the British and of other military systems. As a result he persuaded Choshiu to remodel his army, and to exchange the bows and arrows of his men for guns and rifles. But Ito felt that his knowledge of foreigners, if it was to be thorough, should be sought for in Europe, and with the connivance of Choshiu he, in company with Inouye and three other young men of the same rank as himself, determined to risk their lives by committing the then capital offence of visiting a foreign country. With great secrecy they made their way to Nagasaki, where they concluded an arrangement with the agent of Messrs Jardine, Matheson & Co. for passages on board a vessel which was about to sail for Shanghai (1863). At that port the adventurers separated, three of their number taking ship as passengers to London, while Ito and Inouye preferred to work their passages before the mast in the *Pegasus,* bound for the same destination. For a year these two friends remained in London studying English methods, but then events occurred in Japan which recalled them to their country. The treaties lately concluded by the Shôgun with the foreign Powers conceded the right to navigate the strait of Shimonoseki, leading to the Inland Sea. On the northern shores of this strait stretched the feudal state ruled over by Prince Choshiu, who refused to recognize the clause opening the strait, and erected batteries on the shore, from which he opened fire on all ships which attempted to force the passage. The Shôgun having declared himself unable in the circumstances to give effect to the provision, the treaty Powers determined to take the matter into their own hands. Ito, who was better aware than his chief of the disproportion between the fighting powers of Europe and Japan, memorialized the Cabinets, begging that hostilities should be suspended until he should have had time to use his influence with Choshiu in the interests of peace. With this object Ito hurried back to Japan. But his efforts were futile. Choshiu refused to give way, and suffered the consequences of his obstinacy in the destruction of his batteries and in the infliction of a heavy fine. The part played by Ito in these negotiations aroused the animosity of the more reactionary of his fellow-clansmen, who made repeated attempts to assassinate him. On one notable occasion he was pursued by his enemies into a tea-house, where he was concealed by a young lady beneath the floor of her room. Thus began a romantic acquaintance, which ended in the lady becoming the wife of the fugitive. Subsequently (1868) Ito was made Governor of Hiogo, and in the course of the following year became Vice-Minister of Finance. In 1871 he accompanied the Daimio Iwakura on an important mission to Europe, which, though diplomatically a failure, resulted in the enlistment of the services of European authorities on military, naval, and educational systems. After his return to Japan Ito served in several cabinets as head of the Bureau of Engineering and Mines, and in 1886 he accepted office as Prime Minister, a post which by 1902 he had held four times. In 1882 he was sent on a mission to Europe to study the various forms of constitutional government; on this occasion he attended the coronation of the Tsar Alexander III. On his return to Japan he was entrusted with the arduous duty of drafting a constitution. In 1890 he reaped the fruits of his labours, and nine years later he was destined to witness the abrogation of the old treaties, and the substitution in their place of Conventions which place Japan on terms of equality with the European States. In all the startling reforms in the Land of the Rising Sun Ito played a leading part. It was mainly due to his active interest in military and naval affairs that he was able to meet Li Hung-chang at the end of the Chinese and Japanese war (1895) as the representative of the conquering state, and the conclusion of the Anglo-Japanese Alliance in 1902 testified to his triumphant success in raising Japan to the first rank among civilized Powers. As a reward for his conspicuous services in connexion with the Chinese war Ito was made a marquis, and in 1897 he accompanied Prince Arisugawa as a joint representative of the Mikado at the Diamond Jubilee of Queen Victoria. At the close of 1901 he again, though in an unofficial capacity, visited Europe and the United States.

Iuka, capital of Tishomingo county, Mississippi, U.S.A., on the Southern Railroad, at an altitude of 460 feet. It is chiefly known as the site of a battle during the Civil War between a part of General Grant's army under General Rosecrans and the Confederates under General Price, in which the latter were defeated. Population (1890), 1019; (1900), 852.

Ivanovo - Voznesensk, a town of Middle Russia, government and 86 miles by rail north of Vladimir. It has thirty-eight cotton factories, which employ 26,000 hands, and thirty-two other factories, the aggregate returns being about £3,800,000 per annum. Population (1887), 22,000; (1897), 53,950.

Ivory Coast, The, a French West African colony, bounded on the S. by the Gulf of Guinea, on the W. by Liberia and French Guinea, on the N. by Senegal and the military territories of the Sudan, on the E. by the Gold Coast. The coast is low, bordered with lagoons, and difficult of access on account of the bar. Back from the coast are the Kong ranges of hills, from 3000 to 4000 feet high, terminating in steep slopes in the south. Starting on the Liberian frontier, the rivers are the Cavally, the San Pedro, the Sassandra (240 miles), which comes from the extremity of the Kong plateaus, the Bandama (225 miles), formed by the White and the Red Bandama, and the Komoe (360 miles). The climate is in general hot on the coast and (owing to the lagoons) unhealthy, the rainfall being very heavy. The fauna and flora are similar to those of Senegal and the Sudan. This country is stated to have been visited by Dieppe merchants even in the 14th century, and a French factory was established from 1700 to 1707. After exploration by Commandant Bouet Williaumez in 1838, the natives ceded some territories to the Monarchy of July. In 1843 Assinie and Grand Bassam were occupied. In 1849, and again in 1893, armed conflicts arose between the Europeans and the native tribes. France evacuated her factories in 1872, but reoccupied them in 1883. Between 1887 and 1889 Captain Binger traversed the whole region between the coast and the Niger, visited Bonduku and the Kong country, and signed protectorate treaties with the chiefs. It was to the zone between the Kong states and the hinterland of Liberia that Samory fled for refuge before he was taken prisoner, and for a short time he was master of Kong. Serious trouble was experienced with the natives as late as 1899. The boundary on the west was settled by the Franco-Liberian Agreement of 1892; that on the east by the Anglo-French Agreement of 1893 and 1898. The present northern boundary of the hinterland was fixed on the division of the Sudan (*q.v.: French*) among the other French West African colonies in 1899, when the Ivory Coast, which previously administered most of the Kong protectorate, received the circles of Odjenné, Kong, and Buna. The present area of the colony is estimated at 119,500 square miles, and its population at 1,500,000. It was separated from Senegal in 1893, and is administered by a governor — himself, however, since 1895, under the governor-general of French West Africa—assisted by a council composed of three official and three civilian members. The Ivory Coast, like Guinea and Dahomey, has been allowed to manage its own finances, with the result that it has had to make no claim upon France. In 1899 both revenue and expenditure materially exceeded the budget estimates, the former amounting to £71,000, the latter to £72,000, but the small apparent deficit was in reality fully provided for. The budget for 1900 showed an increase on the former one, and balanced at £56,000. Indirect contributions were estimated to produce £54,000.

The natives cultivate almost nothing but maize and rice; Europeans are trying the cultivation of coffee, which gives good results. Palm-tree products and rubber are collected. It is worth noticing that the collection of the latter in increasing quantities is being effected without destroying the source of supply. Inland there are immense forests rich in mahogany, which are now beginning to be worked. Gold is found, but not in sufficient quantities to tempt Europeans to work it; the natives, however, obtain it to a value ranging from £1000 to £36,750 in the year. The exportation of ivory has almost ceased. By the agreement of 1898 commerce as far as 9° N. is duty-free for at least thirty years. The value of the trade has rapidly increased. In 1900 imports were valued at £263,000, of which £103,000 was the share of France and her colonies. The principal items in 1898 (total, £224,000), apart from specie (£22,000), were: cotton fabrics (almost entirely from Great Britain), £34,400; intoxicants (mostly from the United States), £30,400; and leaf tobacco (Holland, the United States, and Germany), £18,600. Exports increased in value from £202,000 in 1898 (of which only £37,400 worth went to France) to £323,000 in 1900. Three articles of export at present stand out high above all others: mahogany, valued at £46,000 in 1898 and £24,000 in 1899; palm oil, £70,000 in 1898, £73,000 in 1899; rubber, £52,000 in 1898, £114,000 in 1899. The lagoon of Grand Bassam, affording shelter for vessels, constitutes a good inland roadstead. Similarly, Assinie, 30 miles to the east, is situated on a lagoon. Elima is the centre of coffee plantations covering 1500 acres. Grand Lahou has the trade of the Bandama. Grand Bassam is in regular communication by steamer with Bordeaux and Marseilles and Liverpool. It is also connected with Europe by submarine cable. Inland, roads have been constructed. A considerable portion of a telegraph line connecting the coast with the Sudan has been laid down, and a railway, 178 miles long, running inland from Abidjean is under construction.

Ivry-sur-Seine, a town and railway station in the arrondissement of Sceaux, department of Seine, France, about half a mile S.S.E. of the Outer Circle of Paris. It has a large hospital for incurables. There are important steel-works, breweries, and oil-works. Port traffic, including Pont d'Ivry, 1898, 266,884 tons. Population (1891), 19,830; (1901), 28,585.

Ixelles, a town of Belgium, in the province of Brabant, containing the zoological gardens—a favourite promenade—of Brussels, of which it is a suburb. Population (communal, 1880), 36,324; (1900), 58,615.

Izhevskiy Zavod, or IZHEVSKOI, town of Russia, in the Ural Mountains, government of Vyatka, 145 miles south-west of Perm, 27 miles from the Kama, on Izh river. It has one of the chief steel and rifle works of the Russian Crown. About 190,000 rifles are produced yearly at the works, while the making of sporting guns is a widely-spread domestic industry. Population, 21,500.

Izmail, a district town of Russia, government of Bessarabia, on the left bank of the Kilia branch of the Danube, 57 miles below Reni railway station. It was annexed to Russia in 1878. There are steam and horse flour-mills. It has a custom-house, and is visited every year by more than 1000 vessels. The population in 1897 was 31,000, comprising Great and Little Russians, Bulgars, Jews, Tziganes (Gypsies), &c.

Izu-no-shichi-tô, the seven (*shichi*) islands (*tô*) of Izu, which are included in the empire of Japan. They stretch in a southerly direction from a point near the mouth of Tôkyô Bay, and lie between 33° and 34° 48′ N. and between 139° and 140° E. Their names, commencing from the north, are Izu-no-Oshima, Tô-shima,

Nii-shima, Kôzu-shima, Miyake-shima, and Hachijo-shima. There are some islets in their immediate vicinity. Izu-no-Oshima, an island 10 miles long and 5½ miles wide, is only 15 miles from the nearest point of the Izu promontory. It is known to western cartographers as Vries Island, a name derived from that of Captain Martin Gerritsz Vries, a Dutch navigator, who is supposed to have discovered the island in 1643. But the group was known to the Japanese from a remote period, and used as convict settlements certainly from the 12th century and probably from a still earlier era. Hachijo, the most southerly, is often erroneously written "Fatsisio" on English charts. Izu-no-Oshima, or Vries Island, is remarkable for its smoking volcano, Mihara (2395 feet), a conspicuous object to all ships bound for Yokohama. Three others of the islands—Nii-shima, Kôzu-shima, and Miyake-shima—have active volcanoes. Those on Nii-shima and Kôzu-shima are of inconsiderable size, but that on Miyake-shima, namely, Oyama, rises to a height of 2707 feet. The most southerly island, Hachijo-shima, has a still higher peak, Nishi-yama (2913 feet), but it does not emit any smoke.

Izyum, a district town of Russia, government and 81 miles south-east of Kharkov, on the Donets. There is trade in corn and cattle. Population, 13,000.

Jaca, a town of Spain, near the French frontier, in the province of Huesca. Owing to its position on the Pyrenean high road to France, and on the projected international railway, the town has gained in commercial importance. General improvements have been effected and frontier defence works constructed in the neighbourhood. Population, 5157.

Jackson, capital of Jackson county, Michigan, U.S.A., on the Grand River, near its head, at an altitude of 925 feet. The city has a rather irregular plan, is divided into eight wards, and has an excellent water-supply by the Holly pumping system, and good sewerage. It is at the intersection of four railways: the Cincinnati Northern, the Grand Trunk, the Lake Shore and Michigan Southern, and the Michigan Central. It contains the State penitentiary and the principal shops of the Michigan Central Railroad. Its manufacturing establishments in 1890 numbered 220, with a capital of nearly $5,000,000, employing 3630 hands and producing goods valued at $5,376,347. Prominent among these were carriages and waggons, whose value was nearly one-fifth of the total product; flour, corsets, and machine-shop products. Population (1880), 16,105; (1890), 20,798; (1900), 25,180, of whom 3843 were foreign-born and 473 negroes.

Jackson, capital of Hinds county and of the state of Mississippi, U.S.A., on the Pearl river, at an altitude of 291 feet, at the intersection of three railways: the Illinois Central, the Queen and Crescent, and the Yazoo and Mississippi Valley. It has a large cotton trade. Population (1890), 5920; (1900), 7816, of whom 119 were foreign-born and 4447 negroes.

Jackson, capital of Jackson county, Ohio, U.S.A. It lies in an iron and coal region, and contains furnaces and other ironworks. It is on the Baltimore and Ohio South-Western, the Ohio Southern, and the Hocking Valley Railways. Population (1880), 3021; (1890), 4320; (1900), 4672, of whom 232 were foreign-born and 140 negroes.

Jackson, capital of Madison county, Tennessee, U.S.A., at an altitude of 425 feet, at the intersection of the Illinois Central, the Mobile and Ohio, and the Nashville, Chattanooga, and St Louis Railways. It has a large cotton trade and railway machine works. It is the seat of the South-Western Baptist University, which in 1898 had 11 instructors and 270 students. Population (1880), 5377; (1890), 10,039; (1900), 14,511, of whom 224 were foreign-born and 6108 negroes.

Jackson, Helen Maria (1831–1885), American poetess, known by her pseudonym of "H. H.," was born in Amherst, Massachusetts, on the 18th October 1831, the daughter of Nathan W. Fiske, a professor in the college at that place. Her first husband was Captain Edward B. Hunt, of the United States army. After his death, in 1863, and other bereavements, Mrs Hunt's mind turned towards serious thought on many moods of life and experience, which she expressed in a little volume of meditative *Verses* (1870), of which the aged Emerson, in the preface to his *Parnassus* (1874) remarked: "The poems of a lady who contents herself with the initials H. H. . . . have rare merit of thought and expression, and will reward the reader for the careful attention which they require." Thenceforward she was a prolific writer of prose and verse, including juvenile tales, books of travel, household hints, and novels, of which none has retained a place in American literature save *Ramona* (1884), a defence, in the form of fiction, of the Indian character, in which she had become deeply interested. *A Century of Dishonor* (1881) was an arraignment, in historical chapters, of the treatment of the Indians by the United States. In 1875 she married William S. Jackson, a merchant of Colorado Springs, Colorado; and died in San Francisco on the 12th of August 1885. (C. F. R.)

Jacksonville, capital of Duval county, Florida, U.S.A., on St Johns river. It is regularly laid out, and has a good water-supply and sewerage. It is entered by six railways, which, with the fine harbour, greatly improved by dredging, give it a large commerce. Its exports consist of cotton, lumber, naval stores, fruit, and phosphates. Its manufactures consist largely of lumber and cigars. Population (1890), 17,201; (1900), 28,429, of whom 1166 were foreign-born and 16,236 negroes.

Jacksonville, capital of Morgan county, Illinois, U.S.A., at an altitude of 578 feet, and at the intersection of the Chicago and Alton, the Chicago, Peoria, and St Louis, the Jacksonville and St Louis, and the Wabash Railways. It is the site of several state charitable institutions, the Deaf and Dumb Asylum, the Insane Asylum, and the Blind Asylum. It contains also several educational institutions, especially Illinois College, a non-sectarian institution, which in 1899 had 15 instructors and 239 students, and Illinois Women's College, which in the same year had 16 instructors and 248 students. Population (1890), 12,935; (1900), 15,078, of whom 1497 were foreign-born and 997 negroes.

Jacobabad, a town of British India, the administrative headquarters of the Upper Sind frontier district in Bombay; a station on the Quetta branch of the North-Western Railway, 37 miles from the junction at Ruk on the main line. Population (1881), 11,352; (1891), 12,396. The town was founded in 1847 by General John Jacob, for many years commandant of the Sind Horse, who died here in 1858. It has cantonments for a cavalry and an infantry regiment, with accommodation for caravans from Central Asia. It is watered by two canals. An annual horse show is held in January.

Jacobsen, Jens Peter (1847–1885), Danish imaginative writer, was born at Thisted in Jutland, on the 7th of April 1847; he was the eldest of the five children of a prosperous merchant. From 1856 to 1862 he was at school in his native town; he then read at home for a year, and was sent later in 1863 to Copenhagen. He became a student at the university in 1868. As a boy he showed a remarkable turn for science, particularly for botany. In 1870, although he was secretly writing verses already, Jacobsen definitely adopted botany as a profession. He was sent by a scientific body in Copenhagen to report on the flora of the islands of Anholt and Lœsö. About this time the discoveries of Darwin began to exercise a fascination over him, and finding them little understood in Denmark, he translated into Danish *The Origin of Species* and *The Descent of Man*. He continued to work at the lower vegetable forms with such energy that his zeal, in fact, proved fatal to him, for in the autumn of 1872, while collecting plants in a morass near Ordrup, he contracted pulmonary disease. His illness, which cut him off from scientific investigation, drove him to literature. He met the famous critic, Dr Georg Brandes, who was struck by his powers of expression, and under his influence, in the spring of 1873, Jacobsen began his great historical romance of *Marie Grubbe*. His method of composition was painful and elaborate, and his work was not ready for publication until the close of 1876. His health grew steadily but very slowly worse. In 1879, indeed, he was too ill to write at all; but in 1880 an improvement came, and he finished his second novel, *Niels Lyhne*. In 1882 he published a volume of six short stories, most of them written a few years earlier, called, from the first of them, *Mogens*. After this he wrote no more, but lingered on in his mother's house at Thisted until 30th April 1885. In 1886 his posthumous fragments were collected. It was early recognized that Jacobsen was the greatest artist in prose that Denmark has produced. He has been compared with Flaubert, with De Quincey, with Pater; but these parallelisms merely express a sense of the intense individuality of his style, and of his untiring pursuit of beauty in colour, form, and melody. Although he wrote so little, and crossed the living stage so hurriedly, his influence in the North has been far-reaching. It may be said that no one in Denmark or Norway has tried to write prose carefully since 1880 whose efforts have not been in some degree modified by the example of Jacobsen's laborious art. His *Samlede Skrifter* appeared in two volumes in 1888; in 1899 his letters (*Breve*) were edited by Edvard Brandes. In 1896 an English translation of part of the former was published under the title of *Siren Voices: Niels Lyhne*, by Miss E. F. L. Robertson. (E. G.)

Jade, or Jahde, a deep bay and estuary of the North Sea, belonging to the grand duchy of Oldenburg, Germany. The bay, which was for the most part made by storm-floods in the 13th and 16th centuries, measures 70 square miles, and has communication with the open sea by a fairway, some 2 to 3 miles wide, which never freezes, and with the tide gives access to the largest vessels. On the west side of the entrance to the bay is the Prussian naval port of Wilhelmshaven. A tiny stream, about 14 miles long, also known as the Jade, enters the head of the bay.

Jaen, a province of southern Spain. It is divided into 13 administrative districts and 97 parishes, covering 5184 square miles. In 1897 the population was 463,806. The birth-rate was 3·92 per thousand and the death-rate 38·5 per thousand; the proportion of illegitimate births was only 3·63 per cent. The main railway line from Madrid to Cordova, Seville, and Cadiz runs through the province, and has a branch from Vendellano to the important mining centre of Linares. Another line runs from Linares to Puente Jenil. There are 200 miles of first-class roads, and the municipal and provincial roads are fairly good. Apart from agriculture and mines, the only local industries are saw-milling and manufactures of oils, alcohols, and esparto-grass rugs. The mining interests of the province are progressing. More mines are being worked and fresh concessions duly registered every year, and the works also are developing. Two zinc and 294 lead mines give employment to 7800 hands. No less than 180 tons of zinc, 119,375 tons of lead, 7935 tons of carbonate have been extracted, and the factories have turned out 29,163 tons of lead and 13,000 ℔ of silver. There are in addition 349 registered and yet unproductive mines, mostly lead. In 1898 the live stock in the province included 5469 horses, 16,775 mules, 11,890 asses, 10,305 cattle, 197,519 sheep, 48,136 goats, 32,115 pigs. Agriculture is thriving; there were 520,000 acres covered with wheat crops, 342,500 acres with oats, rye, barley, maize, 115,000 acres with pod fruit, 9000 acres with vines, and 382,000 acres with olives.

Jaen, the capital of the above province. Its educational establishments include primary schools for both sexes, an institute, a school for training teachers, a couple of religious seminaries, and several convents for girls. Its silk industry, formerly in good repute, has decayed, and the local manufactures are now mostly leather, soap, alcohol, and linen stuffs. Population, 25,804.

Jaffna, a town of Ceylon, at the northern extremity of the island. In 1901 it had a population of about 47,000, while in the district or peninsula of the same name there were 299,541 persons, nearly all Tamils, the only Europeans being the civil servants and a few planters. Cocoanut planting has not been successful of recent years. The natives grow palmyras freely, and have a trade in the fibre of this palm. They also grow and export tobacco, but not enough rice for their own requirements. A steamer calls weekly, and there is considerable trade. The railway extension from Kurunegala due north to Jaffna and the coast was commenced in 1900. Annual average rainfall, 44 inches; average temperature, 81·7°. Jaffna is the seat of a government agent and district judge, and criminal sessions of the supreme court are regularly held. Much missionary and educational work is carried on in the peninsula, by Roman Catholic, Church of England, Wesleyan, and American missions.

Jagannath Shankersett (1800–1865), the recognized leader of the Hindu community of Bombay for more than forty years, was born in 1800 into a family of goldsmiths of the Daivadnya caste. Unlike his forefathers, he engaged in commerce, and, by means of diligence joined to intelligence and force of character, he soon acquired what was in those days a large fortune, a great part of which he devoted to the good of the public. So high was his credit in the city that Arabs, Afghans, and other foreign merchants chose to place their treasures in his custody rather than with the banks. Foreseeing the need of better methods of education, he became one of the founders of the School Society and the Native School of Bombay, the first of its kind in Western India, which in 1824 developed into the Bombay Native Institution, and again in 1840 into the Board of Education which preceded the Elphinstone Educational Institution founded in 1856. In all these successive advances in the educational life of those times Jagannath Shankersett took the leading and most active part. When the Students' Literary and

Scientific Society first opened their girls' schools, in spite of strong opposition of the Hindu community, Jagannath backed the reformers up, and soon set the good example of providing another girls' school entirely at his private cost. His zeal for progress was also shown in his starting at his own expense the English School, the Sanskrit Seminary, and the Sanskrit Library, all in Girgaum. He was President of the Agri-Horticultural Society of Western India, of the Victoria and Albert Museum, and Victoria Gardens Committee, and of the Bombay Association. In all municipal and sanitary affairs of Bombay he took keen interest, and his efforts in support of railways and new roads were untiring and successful. To Jagannath Shankersett, indeed, and his public-spirited friends, Sir George Birdwood and Dr Bhau Daji, Bombay is indebted for the reconstruction which, beginning in 1857, has gradually changed a close network of lanes and streets into a spacious and airy city, adorned with fine avenues and splendid buildings. He very early became and remained an acceptable adviser to the Government, and was consulted by them on all matters connected with the views and sentiments of the natives. In this way he secured for them in 1829 the right of sitting in the Grand Jury, and their inclusion in the Commission of Justices of the Peace. He was the first Indian to be nominated to the Legislative Council of Bombay under the Act of 1861, an honourable recognition of the confidential services rendered by him to a long series of governors. While, on the one hand, his weighty influence was used by Sir John Malcolm to induce the Hindus to acquiesce in the suppression of *sati* or widow-burning, his own community remember gratefully that to him they owe the cremation ground at Sonapur, still used for the burning of their dead. He died at Bombay, on the 31st July 1865, regretted by all classes of society, who in token of respect, about a year before his death, in a public meeting assembled at the Town Hall, voted a marble statue to perpetuate his memory. He was a fine type of those Indians who for generation after generation have devoted their lives to unite the races of the East and West by the strong ties of mutual regard and friendship. (N. B. W.)

Jägerndorf (Czech, *Krnov*), the chief town of a government district and principality of the same name in Austrian Silesia, situated at the confluence of the Gold-Oppa and the Oppa at the foot of the Burgberg. It is a station on the Central Moravian-Silesian and Prussian State railways. It has a château belonging to Prince Liechtenstein, who holds large estates in this district, and on the neighbouring Burgberg is a church much visited as a place of pilgrimage, and the ruins of the seat of the former princes of Jägerndorf. The town suffered severely in the Thirty Years' War, and was the scene of engagements between the Prussians and Austrians in May 1745 and January 1779. The claim of Prussia to the principality of Jägerndorf was the occasion of the First Silesian War. The partition which followed left Austria the larger portion, now part of Austrian Silesia. The town has a considerable trade and a large textile industry (cloth and woollens), a machine factory, &c. The population in 1890 was 14,257, chiefly German and Catholic (2 per cent. Czech, 4 per cent. Jewish, and 3 per cent. Protestant (1900), 14,675.

Jaice, Jajce, or Iaïtze, an ancient royal town of Bosnia, 97 miles north-west of Sarajevo by rail, splendidly situated on the slope of the Gola Planina and on the left bank of the Vrbas (an affluent of the Save), where it receives the waters of the Pliva by a magnificent waterfall of 100 feet. It is specially celebrated for its ancient fortress, which preserves within its walls portions of a still more ancient royal palace of the kings of Bosnia. There are also large catacombs. In the Franciscan church is the coffin with remains (rediscovered in 1888) of Tomashewitch, the last king of Bosnia, captured and executed by the Turks in 1493. The water-power of the Pliva fall has been used for industrial purposes. Population, 5000.

Jainism.—Considerable progress has been made in the publication and elucidation of the original authorities for this interesting form of faith. But a great deal remains yet to be done. The oldest books now in the possession of the modern Jains purport to go back, not to the foundation of the existing Order in the 6th century B.C., but only to the time of Bhadrabûhu, two centuries later. The whole of the still older literature, on which the revision then made was based, the so-called *Pûrvas*, have been lost. And the existing canonical books, while preserving a great deal that was probably derived from them, contain also much of later material. The problem remains to sort out the older from the later, to distinguish between the earlier form of the faith and its subsequent developments, and to collect the numerous data for the general, social, industrial, religious, and political history of India. Prof. Weber has given a fairly full and carefully-drawn-up analysis of the whole of the more ancient books in the second part of the second volume of his *Catalogue of the Sanskrit MSS. at Berlin*, published in 1888, and Prof. Bhandarkar has given an account of the contents of many later works in his *Report on the Search for Sanskrit MSS.*, Bombay, 1883. And a small beginning has been made in editing and translating these works. The best *précis* of a long book, given in a few pages only, can necessarily only deal with the more important features in it. And in the choice of what should be included, and what left out, the *précis*-writer will often omit precisely the points some subsequent investigator may most especially want. All the older works ought therefore to be properly edited and translated in full, and properly indexed. The Jains themselves have now printed in Bombay a complete edition of their sacred books. But the critical value of this edition, and of other editions of separate texts printed elsewhere in India, leaves much to be desired. Prof. Jacobi has edited and translated the *Kalpa Sûtra*, containing a life of the founder of the Jain Order; but this can scarcely be older than the 5th century of our era. He has also edited and translated the *Âyâranya Sutta* of the Swetambara Jains. The text, published by the Pali Text Society, is of 140 pages octavo. The first part of it, about 50 pages, is a very old document on the Jain views as to conduct, and the remainder consists of appendixes, added at different times, on the same subject. The older part may go back as early as the 3rd century B.C., and it sets out more especially the Jain doctrine of *tapas* or self-mortification, in contradistinction to the Buddhist view, which condemned asceticism. The rules of conduct in this book are for members of the Order. Dr Rudolf Hoernle has edited and translated an ancient work on the rules of conduct for laymen, the *Uvâsaga Dasâo.*[1] Prof. Leumann has edited another of the older works, the *Aupapâtika Sûtra*, and a fourth, entitled the *Dasa-vaikâlika Sûtra*, both of them published by the German Oriental Society; and finally, Prof. Jacobi has translated two more, the *Uttarâdhyâyana* and the *Sûtra Kritânga.*[2] Thus about one-hundredth part of these interesting and valuable old records are now accessible to the European scholar. It is the sect of the Svetâmbaras which has preserved the oldest literatures. Prof. Jacobi has discussed

[1] Published in the *Bibliotheca Indica*, Calcutta, 1888.

[2] These two, and the other two mentioned above, form vols. i. and ii. of his *Jaina Sûtras*, published in the *Sacred Books of the East*, 1884, 1895.

in two papers the history of the schism between them and the Digambaras, and several scholars—notably Bhagvanlâl Indrajî, Mr Lewis Rice, and Hofrath Buhler in the articles mentioned below[1]—have treated of the remarkable archæological discoveries lately made. These confirm the older records in many details, and show that the Jains, in the centuries before the Christian era, were a wealthy and important body in widely separated parts of India. A further confirmation of the substantial accuracy of the existing Jain records has been found in the numerous references to Jains, and to points of Jain belief, in the recently published Buddhist Nikâyas. These are older than the oldest of the Jain books. But the details they give show that the latter have not altered very much from the original tenets of their faith so represented, not seldom with evident bias, by their rivals the Buddhists.

It is now certain that the Jain community was really even older than the time of the Buddha, and was reorganized by his contemporary the Mahâ Vîra, named Vaddhamâna. And it is also clear that the Jain views of life were, in the most important and essential respects, the exact reverse of the Buddhist views. The two orders, Buddhist and Jain, were not only, and from the first, independent, but directly opposed the one to the other. In philosophy the Jains are the most thorough-going supporters of the old animistic position. Nearly everything, according to them, has a soul within its outward visible shape—not only men and animals, but also all plants, and even particles of earth, and of water (when it is cold), and fire and wind. The Buddhist theory, as is well known, is put together without the hypothesis of "soul" at all. The word the Jains use for soul is *jîva*, which means life; and there is much analogy between many of the expressions they use and the view that the ultimate cells and atoms are all, in a more or less modified sense, alive. They regard good, and evil, and space as ultimate substances which come into direct contact with the minute souls in everything. And their best-known position in regard to the points most discussed in philosophy is *Syâd-vâda*, the doctrine that you may say "Yes" and at the same time "No" to everything. You can affirm the eternity of the world, for instance, from one point of view, and at the same time deny it from another; or, at different times and in different connexions, you may one day affirm it and another day deny it. This position both leads to vagueness of thought and explains why Jainism has had so little influence over other schools of philosophy in India. On the other hand, the Jains are as determined in their views of asceticism (*tapas*) as they were compromising in their views of philosophy. Any injury done to the "souls" being one of the worst of iniquities, the good monk should not wash his clothes (indeed, the most austere will reject clothes altogether), nor even wash his teeth, for fear of injuring living things. "Subdue the body, chastise thyself, weaken thyself, just as fire consumes dry wood." It was by suppressing, through such self-torture, the influence on his soul of all sensations that the Jain could obtain salvation. It is related of the founder himself, the Mahâ Vîra, that after twelve years' penance he thus obtained Nirvâna (Jacobi, *Jaina Sûtra*, i. 201) before he entered upon his career as a teacher. And through the rest of his life, till he died at Pâvâ, shortly before the Buddha, he followed the same habit of continual self-mortification. The Buddha, on the other hand, obtained Nirvâna in his 35th year, under the Bodhi-tree, after he had abandoned penance; and through the rest of his life he spoke of penance as quite useless from his point of view. There is no manual of Jainism as yet published, but there is a great deal of information on various points in the introductions to the works quoted above. (T. W. R. D.)

[1] The *Hatthi Gumphâ* and three other inscriptions at Cuttack, Leyden, 1885; *Sravana Belgola* inscriptions, Bangalore, 1889; *Vienna Oriental Journal*, vols. ii.–v.; *Epigraphia Indica*, vols. i.–iv.

Jalaun, a town and district of British India, in the Allahabad district of the North-West Provinces. The town has a population of about 10,000, but is not a municipality. Formerly it was the residence of a Mahratta governor, but never the headquarters of the district, which are at Orai. The district of JALAUN forms part of British Bundelkhand; area, 1480 square miles. The population in 1881 was 418,142; in 1891, 396,361; and in 1901, 400,619; average density, 268 per square mile; land revenue and rates, Rs.5,92,905, the incidence of assessment being R.1:1:4 per acre; cultivated area (1896–1897), 283,641 acres, of which 59,810 were irrigated, including 47,075 from Government canals; number of police, 1743; number of vernacular schools (1896–97), 62, with 2264 pupils; registered death-rate (1897), 58·9 per thousand. The two largest towns are Kunch (13,408) and Kalpi (12,713). The district is now traversed by the line of the Indian Midland Railway from Jhansi to Cawnpore. A small part of it is watered by the Betwa canal, a "protective" work which has never paid the interest on the capital expended.

Jalisco, a state of Mexico, bounded on the N. by the states of Sinaloa, Durango, Zacatecas, and Aguascalientes; on the E. by Zacatecas, San Luis Potosí, Guanajuato, and Michoacan; on the S. by Colima and Michoacan; and on the W. by the Pacific. It has an area of 31,855 square miles, and had a population in 1879 of 983,484, and in 1900 of 1,137,311. It is well timbered, and has a climate varying according to the altitude. It is rich through its mines, agriculture, and stock-raising. The capital, Guadalajara, had in 1895 a population of 83,934; and amongst other towns are Zapotlanejo (20,270), Ciudad Guzmán (17,374), Lagos (14,716), Sayula (8819), Tamazula (8783), Autlan (8710), Teocaltiche (7568), Ameca (7212), Cocula (7090), Etzatlan (6753), La Barca (6465), Zacualco (6338), Tepatitlan (5994), Tizapan el Alto (5708), Colotlan (5590), Atotonilco el Alto (5551), Arandas (5367), and Ahualuco (5302).

Jalon, a river of Spain, having its source near Estiras, in the province of Soria, where it flows for nearly 32 miles in mountainous districts, before it enters the province of Saragossa. In this province it pursues a direction from west to east, passing near Alhama, Ateca, Calatayud, thence to Paracuellos, Ricla, Rueda, and, going under the imperial canal, joins the Ebro on its right bank at Alagon, after a total course of 180 miles. It has many tributaries in the provinces of Soria and Saragossa. It is not navigable.

Jalpaiguri, or JULPIGOREE, a town and district of British India, in the Rajshahi division of Bengal. The town is on the right bank of the river Tista, and has a railway station about 300 miles due north of Calcutta. Population (1891), 9682. There is a Government high school, with 226 pupils in 1896–97, and one printing-press. The district of JALPAIGURI occupies an irregularly-shaped tract south of Darjiling and Bhutan and north of the state of Cooch Behar. It includes the Western Dwars, annexed from Bhutan after the war of 1864–65. Area, 2962 square miles. The population in 1881 was 581,096; in 1891, 681,352, showing an increase of 17 per cent.; average density, 230 persons per square mile. In 1901 the population was 787,954, showing a further increase of 16 per cent. Land revenue and rates, Rs.7,57,965; number of police, 336; number of boys at school (1896–97), 9691,

being 17·7 per cent. of the male population of school-going age; registered death-rate (1897), 34·03 per thousand. The Western Dwars portion of the district is the principal centre of tea cultivation in Bengal. In 1897 the number of gardens was 285, employing 37,627 hands, with 65,072 acres under tea, yielding 24 million pounds. All these figures show a considerable increase on the previous year. The other portion of the district produces jute. There are 3 steam jute presses, employing 77 hands, with an out-turn of 26,000 bales; and 5 hand-presses, employing 130 hands, with an out-turn of 30,000 bales. The district is traversed by the main line of the Eastern Bengal Railway to Darjiling. It is also served by the Bengal Dwars Railway, with 102 miles open in 1900, and net earnings of £12,929.

Jamaica, the largest island of the British West Indies, lying between the Caribbean Sea and the Gulf of Mexico, about 80 miles to the southward of the eastern extremity of Cuba, within 17° 40′ and 18° 30′ N. and 76° 10′ and 78° 38′ W. It possesses many varieties of climate, due principally to the differences of altitude. Nearly one-half of the area of the whole island is above 1000 feet in height, and temperate in climate. At Kingston the temperature ranges from 70°·7 to 87°·8, and this is generally applicable to all the low-lying land round the coast. At Cinchona, at an elevation of 4907 feet, it varies from 57°·5 to 68°·5. The rainfall varies greatly. For the whole island the annual average is 66·3 inches; at Kingston it is 32·6; at Cinchona it is 105·57; in parts of the north-east it exceeds 200 inches. No month is, as a rule, quite without rain, but the heavy rains come in May and October, the latter being the heavier and lasting the longer. Except near lagoons and morasses, the island is healthy. Yellow fever rarely occurs nowadays. When it did occur in 1885 and 1897, the deaths due to it were in each case under 100, or less than 1 per cent. of the general mortality. The climate of the Santa Cruz mountains is, by reason of its dryness and equability, an ideal one for persons in the early stages of consumption, and for rheumatic subjects. About a century ago Jamaica suffered much from hurricanes, which destroyed buildings and crops. But now, fortunately, they pass to the north and east, and also to the south and west, with comparative frequency, but they rarely strike the island itself.

Flora and Fauna.—Jamaica is most favourably situated for the botanist. The flora shows types from North, Central, and South America, as well as a few European forms and the common plants found everywhere in the tropics. Of flowering plants there are about 2180 distinct species, besides many varieties, and of ferns about 450 species, a number of both being indigenous. The great number of species may be to some extent accounted for by the ranges of altitude, temperature, and humidity to be found in different parts. Amongst the woods suitable for cabinet work, mahogany, cedar, mahoe, yacca, and satinwood are most used. The principal objects of the Government botanical department are the supply of plants yielding products new to the agriculture of the colony, or of a better kind, 40,000 plants being on an average distributed annually; and the providing of information regarding the kind of soil, climate, &c., fitted for the plants, their proper cultivation and preparation for the markets. The principal public garden, with the official residence of the director of public gardens and plantations, is at Hope (700 feet), 5 miles from Kingston; other gardens are at Castleton (580 feet), in the centre of the island; the Hill Gardens at Cinchona (3000 to 6300 feet), in the Blue Mountains; the arboretum, Bath (70 feet), in the east end; and gardens in Kingston and at King's House. Forty-three of the birds of Jamaica are presumed to be peculiar to the island. The chief are the quail, the mountain partridge, the Jamaica heron, ducks, doves, and pigeons. The list by Alfred and Edward Newton, given in the *Jamaica Handbook* for 1881, still remains the standard. The land-crab is considered a delicacy, the land-turtle is eaten, but the iguana is not now used as food. In the sea around the coast there is a fair supply of good fishes, excellent in their way, but lacking for the most part the flavour of fishes of temperate waters. The more popular studies of entomology and conchology still reward the collector by the discovery of new and rare species, or of important facts of structure and life-history. The island is justly celebrated for the number of species of land-shells to be found in it. Similarly with the bats, birds, lizards, and amphibia, there is very much to reward the trained observer or enthusiastic collector. The very abundant and often large limestone caves all over the island, some with and others without water, have not yet been thoroughly explored, but, judging from results elsewhere, should contain unique specimens. In marine zoology, the coral reefs, with their varied skeleton-forming polyps and anemones, the numerous alcyonarians, various coral-dwelling animals, and fishes of brilliant hues and strange forms, are readily accessible along most parts of the coast.

Ethnology.—Only recently has anything like a systematic investigation and study been made of the relics of Jamaica's long-extinct Arawâk Indian inhabitants, but this has shown that the island is rich in such evidences, and more yet remains to be discovered. Collectors still find an abundance of aboriginal petaloid celts and other implements, flattened skulls and vessels in the limestone caves, miscellaneous objects from their kitchen-middens, and now and again an image or rock-carving. The inhabitants at present consist of Maroons, the descendants of those slaves of the Spaniards who fled into the fastnesses of the mountains on the conquest of the island by the British; the descendants of white settlers; British officials; a few still surviving natives of Africa originally imported as slaves; the descendants of African slaves; a mixed race of British and African blood; coolies from India, and a few Chinese. The number of white inhabitants, other than British, is very small. The Maroons live by themselves, and are an almost negligible quantity. The negroes are developing into a land-owning peasantry; the coloured section enter into trade and the professions; the white settlers are not increasing; the coolies on the expiration of their indentures frequently devote themselves to shopkeeping, as do the Chinese.

Area and Population.—The island is divided into three counties—Surrey in the east, Middlesex in the centre, and Cornwall in the west, which are again subdivided into fifteen parishes, as follows:—

County.	Parish.	Area in Square Miles.	Population by Census of 1891.	Population estimated, 1901.
Surrey	Portland	285	31,998	37,817
	St Thomas	274	32,176	37,299
	St Andrew	166	37,885	42,161
	Kingston	$5\frac{1}{12}$	46,542	52,475
	Port Royal	$2\frac{1}{12}$	1,962	
Middlesex	St Mary	249	42,915	51,671
	St Ann	476	54,127	67,133
	St Catherine	470	65,509	76,295
	Clarendon	474	57,105	68,692
	Manchester	302	55,462	70,294
Cornwall	Hanover	167	32,088	37,373
	St James	234	35,050	38,967
	Trelawny	333	30,996	35,095
	St Elizabeth	462	62,256	77,553
	Westmoreland	308	53,450	62,905
		$4207\frac{1}{6}$	639,521	755,730

The following table shows the changes in population according to the census of 1881 and 1891:—

	1881 Census.	1891 Census.
White	14,432	14,692
Coloured	109,946	121,955
Black	444,186	488,624
East Indian	11,016	10,116
Chinese	99	481
Not stated	1,125	3,653
Total	580,804	639,521
Males	282,957	305,958
Females	297,847	333,563

No census of the population was taken in 1901.

The following table gives the annual rate of births and deaths per thousand estimated on the mean population, the marriages celebrated, and the illegitimate births per hundred:—

	1881.	1891.	1900–1.
Births per thousand	36·7	38·3	35·7
Deaths ,,	26·0	22·7	21·6
Marriages celebrated	2178	3560	3221
Illegitimate births per hundred	57·7	60·7	62·4

The only emigration of any importance in the last quarter of the 19th century was during the years 1883–86, when the Panama Canal was in course of construction. The emigration was confined almost entirely to adult men, and resulted in a loss to the island of about 20,000 of the population, the chief loss taking place in 1883–84, when 34,852 emigrated to the Isthmus, and only 14,600 returned. Towards the close of 1900 about 2500 labourers emigrated to work on the construction of a railway in Ecuador.

The number of Indian immigrants between 1870 and 1880 was 9023; since then it has been as follows:—1880, 747; 1881, 504; 1882, none; 1883, 396; 1884, 680; 1885, 601; 1886 to 1890, none; 1891, 2136; 1892, none; 1893, 484; 1894, none; 1895, 698; 1896 to 1898, none; 1899, 615; 1900, 650.

Government.—The system of Crown government (instituted in 1865) by a governor, assisted by a legislative council consisting of *ex-officio* and nominated members, worked well till 1884, when matters came to a deadlock on account of a vote forced by the Government for damages for the seizure of the *Florence*, a vessel suspected of a breach of the foreign enlistment laws. This resulted in the resignation of all the unofficial members, and in the unwillingness of any private person to accept the position of a nominated member. Accordingly a change was made by which members elected by a limited suffrage were substituted for members nominated by the Crown, and the council was reconstituted with three *ex-officio*, four nominated officials, and nine elected members, with the governor as president. In 1895 the number of elected members was increased from nine to fifteen, *i.e.*, one for each parish of the island, the number of nominated and official members being at the same time proportionately increased from eleven to fifteen, but four of these seats were left vacant. In 1900 four additional nominated members were called in to take their seats, raising the official side of the House to fifteen in number, with fifteen elected members. The local affairs of the various parishes are controlled by elected parochial boards, subject to supervision by the Government.

Religion.—Under the disestablishment law of 1870, which arranged for a gradual disendowment of the Church of England, there are still in receipt of official salary five island curates and one stipendiary curate. The Disestablished Church of England in Jamaica has, including these, 102 clergy; the Baptists, 63; the Wesleyans, 49; the Presbyterian Church, 30; the Moravians, 25; the Roman Catholics, 12; the United Methodists, 9; the Christian Church, 7; the Congregationalists, 5; and the Church of Scotland, 4. The Salvation Army has a branch in the island. There are two Jewish synagogues in Kingston. The Church of England maintains a theological college, a deaconess home, and an orphanage; the Roman Catholics maintain a training college for female teachers, two industrial schools, and two orphanages; and the Baptists have a theological college.

Education.—There has been some reduction in the expenditure for education, and a slight alteration in the school age, which is now 6 to 14. Some inefficient schools have been closed. No grants to new denominational schools will be made, and closely-situated denominational schools will be amalgamated, where practicable, with Government schools. The elementary schools, attendance at which is voluntary, numbered in 1901, 720. They rose from 687 in 1881 steadily to 962 in 1895, since which date they have steadily declined. There were in 1901, 86,491 scholars on the books and 47,441 in average attendance. These schools are subsidized by the State, and receive (in addition) grants in lieu of fees, which were abolished in 1893. The teachers, both male and female, for these elementary schools are trained in the main at three training colleges subsidized by the Government. For higher education there are the University College and High School at Hope near Kingston, Potsdam School in St Elizabeth, Wolmer's Free School in Kingston (for boys and girls) founded in 1729, the Montego Bay Secondary School, and numerous other endowed and self-supporting establishments. Every year a scholarship is awarded of a total value of £600, spread over three, four, or five years, tenable at any of the universities of Great Britain and Ireland. Other smaller scholarships, varying from £60 to £10, are given every year. The Cambridge Local Examinations have been held regularly since 1882. In 1900, 263 candidates (168 boys and 95 girls) entered; of these 199 passed, including the best senior boy and the best senior girl in the empire.

Negroes.—A negro peasant population is growing up, which will, it is to be hoped, in a generation or two prove a mainstay and a support to the industries of the island. Two generations ago the Jamaica negro was treated little better than an ox, and too often purposely kept from all advance either in morals or education; and the consequences of this state of things remain. In many cases a field negro will not work for his employer more than four days a week. He may till his own plot of ground on one of the other days or not, as the spirit moves him, but four days a week will keep him easily. He has little or no care for the future. If by chance he is out of employment (and it is probably his own doing if he is), his needs are few. He has possibly squatted on some one's land, and has no rent to pay. Clothes he need hardly buy, fuel he wants only for cooking purposes, and food is ready to his hand for the picking. Unfortunately a wide-spread indulgence in prædial larceny is a great hindrance to agriculture as well as to moral progress. But that habits of thrift are being inculcated is shown by the steady increase in the accounts in the Government savings banks. That superstition is still prevalent amongst the negroes is unfortunately evidenced by the cases of *obeah*, or witchcraft, that come before the courts from time to time. The years that have passed since emancipation have been all too short to enable the ministers of religion and educators to grapple with the beliefs which are the outcome of centuries of the blackest superstition.

Finance.—The public debt of the colony was in 1901 £3,702,362. The public revenue for 1900–1 was £760,386, and the expenditure £763,662. Nearly half the public revenue (£360,000) is raised by customs duties, in very many cases by an *ad valorem* charge of 16⅔ per cent. Another chief source of revenue consists of licences, excise and internal revenue (£156,575). The more important items of the expenditure of 1900–1 were Debt Charges, £221,323; Administrative Departments (Governor, &c., £6584 + Privy Council £103 + Legislative Council £1257 + Colonial Secretariat £5182 + Clerks to Parochial Boards £947 + Registrar-General £4835 + Registrar of Titles £1563), £20,471; Railway, £51,288; Judicial, £40,306; Medical, £50,234; Police and Prisons, £74,846; Education, £56,071; and Public Works £74,873. Ecclesiastical charges (owing to the results of disestablishment) dwindled from £10,000 in 1879 to £2090 in 1901.

Defence.—There are military forces to the number of about 1750, consisting of a detachment of an infantry regiment and a company of Royal Artillery and one of Royal Engineers, and headquarters staff and four companies of the West India Regiment. There is also a militia, infantry and artillery, about 800 strong. The entrance to the harbour of Port Royal is strongly fortified.

Agriculture.—A Board of Agriculture has recently been appointed by the Government in order to develop the productive resources of the island; and there is also an agricultural society with twenty-six branches throughout the island. Agricultural enterprise in Jamaica may be divided into three kinds—pen-keeping (*i.e.*, the breeding of horses, mules, cattle, and sheep), planting, and a combination of the two. The principal industries of the planter are sugar, coffee, banana and (latterly) orange cultivation, cocoa, cocoanuts, ginger, limes, logwood, nutmegs, pimento, pineapples, and tobacco. Tobacco cultivation was till recently carried on principally by settlers from Cuba, many of whom, however, after the close of the Spanish-American war returned to their own country. Bee-keeping is a rising industry. Sugar estates have been gradually decreasing in number for years, but well-managed estates in advantageous situations still yield good profits. Jamaica Blue Mountain coffee realizes the highest price in the London market, and Jamaica ginger maintains its high reputation. The increase in the planting and exportation of bananas has been remarkable, the value of fruit exported in 1879 having been 2·9 per cent. of the total exports, and in 1899, 41·4 per cent. Of other fruits, the chief exported are oranges, and, to a small extent, grape-fruit, limes, pineapples, and mangoes. Of Crown lands there are about 100,000 acres, of which much is

suitable for cultivation. About 18,000 acres of Crown land are leased to some 2000 tenants; 46,000 are unplanted. Crown lands are sold in small lots to settlers on easy terms.

Manufactures.—The manufactures are few. In addition to the sugar and coffee estates and cigar factories, there are tanneries and breweries, electric light and gas works, iron-foundries, potteries, and factories for the production of cocoanut oil, essential oil, ice, matches, and mineral waters. There is an important establishment at Spanish Town for the production of logwood extract.

Trade.—The following table shows the fluctuations in the imports for home consumption in the years specified :—

	1879.	1889.	1899.
Live animals, food, drink, and narcotics	£633,565	£660,676	£674,094
Raw material	39,776	33,996	63,286
Manufactured articles	668,356	841,911	1,033,388
Coin and bullion	5,645	61,017	17,664
Total	£1,347,342	£1,597,600	£1,788,432

In 1900 the imports amounted to £1,806,865. The following shows the source of supply of the imports for the years named :—

	1879.	1889.	1899.
United Kingdom	50·90	55·0	44·7
United States	31·40	33·9	45·1
Canada	13·96	9·2	7·1
Other countries	3·74	1·9	3·1
	100·0	100·0	100·0

The exports for the same years and 1900 were :—

1879.	1889.	1899.	1900.
£1,357,530	£1,614,824	£1,662,542	£1,868,079

The following is a comparative statement of the proportion of exports during the years stated :—

	1879.		1889.		1899.	
Fruit		2·9		20·3		41·4
Sugar	30·6	45·0	16·3	25·4	9·8	15·9
Rum	14·4		9·1		6·1	
Coffee		18·3		19·4		10·5
Dye-woods		14·0		25·0		8·8
Pimento		5·8		3·2		8·3
Minor products		14·0		6·7		15·1
		100·0		100·0		100·0

The exports for these years were distributed in the following manner :—

	1879.	1889.	1899.
United Kingdom	73·2	37·3	20·0
United States	14·9	50·2	59·0
Canada	1·0	2·3	1·0
Other countries	10·9	10·2	20·0
	100·0	100·0	100·0

Shipping and Navigation.—Several steamship companies run steamers between Jamaica and England, and between Jamaica and the United States and Canada. In 1900 Messrs Elder, Dempster, and Company started their Imperial Direct West India Line with a subsidy of £40,000 contributed jointly by the Imperial Exchequer and the Jamaica Government, with a view to the encouragement of a fruit trade with England. Two steamers, in connexion with the Royal Mail and Direct Lines respectively, go round the island once a week, calling at all the principal ports. A number of sailing "droghers" also ply from port to port. Kingston harbour, the finest in the West Indies, has a total area of about sixteen square miles, of which about seven have a depth of from seven to ten fathoms. After Kingston, the principal ports are Port Antonio, Port Morant, Montego Bay, Lucea, Rio Bueno, and Port Maria, in addition to numerous reef-protected roadsteads. The ports of the island are cleared on an average by 1178 vessels of 829,390 tons annually.

Internal Communication.—Many miles of good driving-roads and bridle-paths have been made, opening up much land for cultivation and beautiful scenery for tourists. Many bridges have been built, rendering passable at all times streams which are unfordable during the rainy season. The main roads, about 1912 miles in extent, under the control of the Public Works Department, encircle the island, with several connexions from north to south. The parochial roads, which are maintained by the parochial boards, measure about 4318 miles. The railway (retransferred to the Government by the American company which had bought it in 1889, but which had failed to work it efficiently) traverses the island diagonally from Kingston in the south-east to Montego Bay in the north-west (113 miles distant), and also in a north-easterly direction to Port Antonio and in a central direction northwards to Ewarton.

Posts and Telegraphs.—Jamaica is included in the Postal Union and in the Imperial penny post and parcel post schemes. There is a weekly mail service to and from England by means of the Royal Mail and Direct Lines, but mails are also carried *viâ* the United States by the Hamburg-American and other companies. There are 149 post-offices in the island, and a tri-weekly (and in many cases a daily) post for letters, book packets, and parcels. Jamaica is connected with America, through Cuba, by the lines of the West India and Panama Telegraph Company, and with Halifax, Nova Scotia, through Bermuda, by the Direct West India Cable. There are telegraph stations at 70 post-offices.

Banking.—In Kingston there are branches of the Colonial Bank of London and the Bank of Nova Scotia. In the Government Savings Bank in Kingston in 1900 there were 32,218 depositors, including charities, societies, clubs, &c., with a total of £468,817 on deposit. There are fourteen branches of the Government savings banks, and thirteen sub-branches. Penny banks have also been established in nearly all the districts of the island by ministers of religion and others.

Currency.—The coins in circulation are British coins, gold and silver of all denominations, but not bronze, instead of which local nickel is used. United States gold passes as currency. English weights and measures are used.

KINGSTON, the capital of Jamaica, stands on a gravelly soil. The population by local census (1901) was 46,542. It covers, with its suburbs, an area of 1080 acres of ground regularly sloping down to the sea. An underground system of drainage is being introduced. The principal streets have been or are being reconstructed, brick, macadam, and asphalt being used in different parts, and the irregularities, due to neglect and heavy washings by rains, are being rectified. The water-supply has been increased, and there is a constant house-to-house supply throughout the city. A system of electric tramways runs throughout the town and suburbs. In the town, Myrtle Bank Hotel, the Jamaica Club, the additions to the lunatic asylum, and the theatre, and to the north of it, the Mico Training College and the Church of England Theological College, are the principal recent buildings. The Institute of Jamaica maintains a public library, museum, and art gallery, especially devoted to local interests. There is a good supply of both gas and electric light, as well as a telephone service and a supply of ice in the city.

PORT ROYAL, formerly the finest town in the British West Indies, never recovered from the effects of the fire of 1816. It is now only a naval and military station, and has been removed from the jurisdiction of the Kingston municipal authorities and placed under a separate board with control by the military and naval authorities. Commanding as it does the entrance to the harbour, it is strongly fortified. The commodore on the station resides there. The naval hospital is of considerable importance.

SPANISH TOWN, the former capital (5019), has since the removal of the seat of government to Kingston in 1872 gradually sunk in importance, the only public office now maintained there being the Record Office.

MONTEGO BAY (4803), on the north-west coast, is the second town in the island in respect of commerce, but PORT ANTONIO (1784), on the north-east, promises, owing to its fruit trade, to surpass it.

Included in the government of Jamaica are the Turks and Caicos Islands, which geographically form part of the Bahama Islands, to which they at one time belonged; the Cayman Islands, which lie from 110 to 150 miles north-west of the west end; the Morant Cays, about 33 miles south-east of the east end of the island; and the Pedro

Cays, about 40 miles south-west of Portland Point, the most southerly point of the island. The inhabitants of the Turks and Caicos Islands (5350 in 1901) live almost entirely by the profits of the salt industry, the salt being made from the sea by evaporation in salt-ponds, the bulk of the product going to the United States. The sea around the Caicos Islands produces a considerable quantity of sponges. The Cayman Islanders, who are in the fortunate position of having no pauper roll, live chiefly by turtling and by the exportation of phosphates. The Morant and Pedro Cays, which are uninhabited, are leased for the purposes of collecting guano, boobies' eggs, and turtle. Turks Islands are reached in two days by steamers which ply monthly between Jamaica and Halifax.

See *Jamaica Handbook*, 1901; BACON and AARON'S *New Jamaica* (1890); W. P. LIVINGSTONE'S *Black Jamaica* (1900); ROBERT T. HILL'S *The Geology and Physical Geography of Jamaica* (1899); MAXWELL HALL'S *Rainfall Atlas* (1892). (F. CU.)

Jamaica, in the western part of Long Island, formerly a village of Queens County, New York, U.S.A., but since 1st January 1898 a part of the fourth ward of the borough of Queens, one of the five boroughs of which New York City is composed. Population (1880), 3922; (1890), 5361.

James, David (1839–1893), English actor, was born in London in 1839, his real name being Belasco. He began his stage career at an early age, and after 1863 gradually made his way up in the profession in humorous parts. His creation, in 1875, of the part of Perkyn Middlewick in *Our Boys* made him famous as a comedian, the performance obtaining for the piece a then unprecedented "run" from 16th January 1875 till 18th April 1879. In 1885 David James had another notable success as Blueskin in the burlesque *Little Jack Sheppard* at the Gaiety Theatre, his principal associates being Fred Leslie and Nelly Farren. His song in this burlesque, "Botany Bay," became widely popular. In the part of John Dory in *Wild Oats* he again made a great hit at the Criterion Theatre in 1886; and among his other most successful impersonations were Simon Ingot in *David Garrick*, Tweedie in *Tweedie's Rights*, Macclesfield in *The Guv'nor*, and Eccles in *Caste*. His unctuous humour and unfailing spirits, combined with his ripe knowledge of theatrical methods and traditions, made him a great popular favourite. He died 2nd October 1893.

James, Henry (1843——), American author, was born in New York on the 15th of April 1843. His father was Mr Henry James, a theological writer of considerable originality, from whom both he and his brother Professor William James derived their psychological subtlety and their idiomatic, picturesque English. Most of Henry's boyhood was spent in Europe, where he studied under tutors in England, France, and Switzerland. In 1860 he came back to America, and began reading law in the Harvard Law School, only to find speedily that literature, not law, was what he most cared for. His earliest short story appeared in 1865, in the *Atlantic Monthly*, and frequent stories and sketches followed. In 1869 he again went to Europe, where he has since made his home, for the most part in London. Among his specially noteworthy works are the following: *Watch and Ward*, 1871; *Roderick Hudson*, 1875; *The American*, 1877; *Daisy Miller*, 1878; *A Life of Hawthorne*, 1879; *The Portrait of a Lady*, 1881; *Portraits of Places*, 1884; *The Bostonians*, 1886; *The Tragic Muse*, 1890; *Essays in London*, 1893; *The Two Magics*, 1898. As a novelist, Mr James is a modern of the moderns both in subject-matter and in method. He is entirely loyal to contemporary life and reverentially exact in his transcription of the phase. His characters are for the most part people of the world who conceive of life as a fine art and have the leisure to carry out their theories. Rarely are they at close quarters with any ugly practical task. They are subtle and complex with the subtlety and the complexity that come from conscious preoccupation with themselves. They are specialists in conduct and past masters in casuistry, and are full of variations and shadows of turning. Moreover, they are finely expressive of *milieu;* each belongs unmistakably to his class and his race; each is true to inherited moral traditions and delicately illustrative of some social code. To reveal the power and the tragedy of life through so many minutely limiting and apparently artificial conditions, and by means of characters who are somewhat self-conscious and are apt to make of life only a pleasant pastime, might well seem an impossible task. Yet it is precisely in this that Mr James is pre-eminently successful. The essentially human is what he really cares for, however much he may at times seem preoccupied with the *technique* of his art or with the mask of conventions through which he makes the essentially human reveal itself. Nor has "the vista of the spiritual been denied him." No more poignant spiritual tragedy has been recounted in recent fiction than the story of Isabel Archer in *The Portrait of a Lady*. Mr James's method is as modern as his subject-matter. He early fell in love with the "point of view," and the good and the bad qualities of his work all follow from this literary passion. He is a very sensitive impressionist, with a *technique* that can "fix" the most elusive phase of character and "render" the most baffling surface. The skill is unending with which he places his characters in such relations and under such lights that they flash out in due succession their continuously varying facets. At times he may seem to forget that a character is something incalculably more than the sum of all its phases; and then his characters tend to have their existence, as Positivists expect to have their immortality, simply and solely in the minds of other people. But when his method is at its best, the delicate phases of character that he transcribes coalesce perfectly into clearly-defined and suggestive images of living, acting men and women. Doubtless, there is a certain initiation necessary for the enjoyment of Mr James. He presupposes a cosmopolitan outlook, a certain interest in art and in social artifice, and no little abstract curiosity about the workings of the human mechanism. But for speculative readers, for readers who care for art in life as well as for life in art, and for readers above all who want to encounter and comprehend a great variety of very modern and finely modulated characters, Mr James holds a place of his own, unrivalled as an interpreter of the world of to-day.

James, Henry James, 1st BARON (1828——), English lawyer and statesman, son of P. T. James, surgeon, was born at Hereford, 30th October 1828, and educated at Cheltenham College. A prizeman of the Inner Temple, he was called to the bar in 1852 and joined the Oxford circuit, where he soon came into prominence. In 1867 he was made "postman" of the Court of Exchequer, and in 1869 became a Q.C. As the result of the general election of 1868 he obtained a seat in Parliament for Taunton as a Liberal, by the unseating of Mr Serjeant Cox on a scrutiny in March 1869, and he kept the seat till 1885, when he was returned for Bury. He attracted attention in Parliament by his speeches in 1872 in the debates on the Judicature Act. In 1873 (September) he was made Solicitor-General, and in November Attorney-General, and knighted; and when Mr Gladstone returned to power in 1880 he resumed his office. He was responsible for carrying the Corrupt Practices Act, 1883. On

Mr Gladstone's conversion to Home Rule, Sir Henry James parted from him and became one of the most influential of the Liberal Unionists: Mr Gladstone had offered him the Lord Chancellorship in 1886, but he declined it; and the knowledge of the sacrifice he had made in refusing to follow his old chief in his new departure lent great weight to his advocacy of the Unionist cause in the country. He was one of the leading counsel for *The Times* in the Parnell Commission, and from 1892 to 1895 was Attorney-General to the prince of Wales. In 1895 he entered the Unionist Ministry as Chancellor for the Duchy of Lancaster, and was made a peer as Baron James of Hereford.

James River, a river of Virginia, U.S.A., rising in the Allegheny Front, on the boundary between Virginia and West Virginia, and flowing across the Appalachian Valley, through the Blue Ridge and down the Atlantic slope with a general eastward course, to the foot of Chesapeake Bay. Its length is 350 miles, and it drains an area of 9684 square miles. Besides many rapids in its upper course, it flows over falls at Richmond, where it crosses the "Fall Line," which have been utilized as sources of power. Below this point the river is a navigable and tidal estuary.

Jameson, Leander Starr (1853——), British Colonial administrator, son of R. W. Jameson, a writer to the signet in Edinburgh, was born at Edinburgh in 1853, and was educated for the medical profession at University College Hospital, London (M.R.C.S. 1875; M.D. 1877). After acting as House Physician, House Surgeon, and Demonstrator of Anatomy, and showing promise of a successful professional career in London, his health broke down from overwork in 1878, and he went out to South Africa and settled down in practice at Kimberley. There he rapidly acquired a great reputation as a medical man, and besides numbering President Kruger and the native chief Lobengula among his patients, came much into contact with Mr Cecil Rhodes. In 1888 he enabled the British South Africa Company to obtain concessions in Matabeleland by visiting Lobengula at Bulawayo; and when the Chartered Company proceeded to open up the country, he abandoned his medical practice and joined the pioneer expedition of 1889. From this time his fortunes were bound up with Mr Rhodes's schemes in the north. In 1890 he obtained the concession from Gungunhana in Gazaland which prevented Portugal from practically asserting her claim to the country. In 1891 Dr Jameson was appointed Administrator of Rhodesia. The events connected with his vigorous administration and the wars with the Matabele are narrated under RHODESIA. At the end of 1894 "Dr Jim" came to England, and was *fêted* on all sides; he was made a C.B., and returned to Africa in the spring of 1895 with enhanced prestige. On the last day of that year the world was startled to learn by telegraph from Africa that he, with a force of 600 Bechuanaland Police, had made a raid into the Transvaal from Mafeking in support of a projected rising in Johannesburg, which had been connived at by Mr Rhodes at the Cape (see RHODES and TRANSVAAL). It need only be stated here that Dr Jameson's force was compelled to surrender at Doornkop; he and his officers were sent to Pretoria, and first sentenced to be shot, but then handed over to the British Government for punishment. They were tried in London under the Foreign Enlistment Act in May 1896, and Dr Jameson was sentenced to fifteen months' imprisonment at Holloway. Dr Jameson served a year in prison, and was then released on account of ill-health. He still retained the affections of the white population of Rhodesia, and subsequently returned there in an unofficial capacity. He was the constant companion of Mr Rhodes on his journeys up to the end of his life, and when Mr Rhodes died in 1902, Dr Jameson was left one of the executors of his will.

Jamestown, a city of Chautauqua county, New York, U.S.A., at the outlet of Chautauqua Lake. It is on the Erie and the Jamestown and Chautauqua Railways, at an altitude of 1317 feet. It is a popular summer resort, with an irregular plan, a good water-supply and sewer system and other municipal improvements. A good and cheap water power from the lake outlet is rapidly bringing it into prominence as a manufacturing city. Population (1890), 16,038; (1900), 22,892, of whom 7270 were foreign-born and 77 negroes.

Jamestown, a district in James City county, Virginia, U.S.A., near the mouth of the James river. The first permanent English settlement within the limits of the United States was founded here in 1607 by 105 colonists under Christopher Newport. At that time it was a peninsula, but the action of the river has changed the peninsula to an island. The town was the capital of the colony until 1699, after which it declined in population and importance, and there are now only a few ruins to mark the spot. The first colonial assembly in America was held here in 1619. It was the scene of an Indian massacre in 1622, and was burned in 1676 during Bacon's rebellion.

Jamkhandi, a native state of India, in the Deccan division of Bombay, ranking as one of the Southern Mahratta Jagirs. Area, 555 square miles. The population in 1881 was 83,917; in 1891, 102,162; average density, 184 persons per square mile; estimated gross revenue, Rs.10,73,324, of which Rs.62,660 was expended on public works in 1897–98; tribute, Rs.20,841; number of police, 326; number of schools 41, with 2318 pupils. The chief, whose title is Bhau Saheb Patwardhan, is a Brahman by caste. The state is under British administration. The town of JAMKHANDI is situated in 60° 30′ N. and 75° 22′ E., 68 miles east of Kolhapur. It has a high school, with 261 pupils in 1897–98. Population (1891), 12,504.

Jammu, or JUMMOO, capital of the native state of Jammu and Kashmir in Northern India, situated in 32° 44′ N. and 74° 54′ E., on the river Tavi, a tributary of the Chenab. Population (1891), 34,352; (1901), 34,097. It is connected with Sialkot in the Punjab by a railway 16 miles long constructed by the state. In 1898 the town was devastated by a fire, which destroyed most of the public offices. Jammu was formerly the residence of an independent Rajput dynasty, which was conquered by the Sikhs at the beginning of the 19th century, and acquired by Ghulab Singh as the nucleus of his dominions, to which the British added Kashmir in 1846. The state of Jammu proper, as opposed to Kashmir, consists of a submontane tract, forming the upper basin of the Chenab. Population (1891), 1,439,543; (1901), 1,515,998, showing an increase of 5 per cent., compared with an increase of 22 per cent. for Kashmir. A land settlement has recently been introduced under British supervision.

Jamsetjee Jeejeebhoy, Sir, 1st BART. (1783–1859), Indian merchant and philanthropist, was born in Bombay in 1783, of poor but respectable parents, and was left an orphan in early life. At the age of sixteen, with a smattering of mercantile education and a bare pittance, he commenced a series of business travels which were destined eventually to lead him to fortune and fame. After a preliminary visit to Calcutta, he undertook a voyage to China, which in those times was fraught with so much difficulty and risk that it was regarded as a venture betokening considerable enterprise and courage; and he subsequently initiated a systematic trade with that

country, being himself the carrier of his merchant wares on his passages to and fro between Bombay and Canton and Shanghai. His second return voyage from China was made in one of the East India Company's fleet, which, under the command of Sir Nathaniel Dance, defeated the French squadron under Admiral Linois (15th February 1804); and on his fourth return voyage from China, the Indiaman in which he sailed was forced to surrender to the French, by whom he was carried as a prisoner to the Cape of Good Hope, then a neutral Dutch possession; and it was only after much delay, and with great difficulty, that he made his way to Calcutta in a Danish ship. Nothing daunted, he undertook yet another voyage to China, which was more successful than any of the previous ones. By this time he had fairly established his reputation as a merchant possessed of the highest spirit of enterprise and considerable wealth, and thenceforward he settled down permanently in Bombay, where he directed his commercial operations on a widely extended scale. His system of conducting business on strictly moral principles, and under his own personal supervision, combined with the high esteem in which he was held for his sagacity, wide experience, and energy, resulted in success after success, until he was recognized throughout India as the prince of merchants. By 1836 his firm was large enough to engross the energies of his three sons and other relatives; and he had amassed what at that period of Indian mercantile history was regarded as fabulous wealth. An essentially self-made man in the strictest sense of the term, and having experienced in early life the miseries of poverty and want, in his days of affluence Jamsetjee Jeejeebhoy developed an active instinct of sympathy with his poorer countrymen, and commenced that career of private and public philanthropy which is his chief title to the admiration of mankind. His liberality was unbounded, and the absorbing occupation of his later life was the alleviation of human distress. To his own community he gave lavishly, but his benevolence was mainly cosmopolitan. Hospitals, schools, homes of charity, pension funds, were founded or endowed by him, while numerous public works in the shape of wells, reservoirs, bridges, causeways, and the like, not only in Bombay, but in other parts of India, were the creation of his bounty. The total of his known benefactions amounted at the time of his death, which took place in 1859, to over £230,000. It was not, however, the amount of his charities so much as the period and circumstances in which they were performed that made his benevolent career worthy of the fame he won. In the first half of the 19th century the different communities of India were much more isolated in their habits and their sympathies than they are now. Jamsetjee Jeejeebhoy's unsectarian philanthropy awakened a common understanding and created a bond between them which has proved not only of domestic value but has had a national and political significance. His firm faith in the benevolence and protection of British rule, of which he gave evidence by placing all his endowments, and even his own wealth, in British securities, infused in the people of India for the first time a spirit of firm confidence in that rule and an unquestioning faith in its stability. These great services were recognized first in 1842 by the bestowal of a knighthood upon him, and in 1858 by that of a baronetcy. These were the very first distinctions of their kind conferred by Queen Victoria upon a British subject in India. His title devolved in 1859 on his eldest son CURSETJEE, who, in pursuance of a provision in the letters-patent, took the name of Sir Jamsetjee Jeejeebhoy as second baronet. At his death, which occurred in 1877, his eldest son, MENEKJEE, assumed the same patronymic and became Sir Jamsetjee Jeejeebhoy, the third baronet. Both had the advantage of a thoroughly good English education, and continued the career of benevolent activity and devoted loyalty to British rule which had signalized the life-work of the founder of the family. They both visited England to do homage to their sovereign; and their public services were recognized by their nomination to the order of the Star of India, as well as by appointment to the Legislative Councils of Calcutta and Bombay. On the demise of the third baronet, the title devolved upon his brother, COWSAJEE, who became Sir Jamsetjee Jeejeebhoy, fourth baronet, and the recognized leader of the Parsee community all over the world. Since their emigration from Persia, that community had never had a titular chief or head, its communal funds and affairs being managed by a public body, more or less democratic in its constitution, termed the "Parsee Panchayat." The first Sir Jamsetjee, by the hold that he established on the community, by his charities and public spirit, gradually came to be regarded in the light of its chief; and the recognition which he was the first in India to receive at the hands of the British sovereign finally fixed him and his successors in the baronetcy in the position and title of its recognized official leader. (M. M. BH.)

Janesville, capital of Rock county, Wisconsin, U.S.A., on the river Rock and the Chicago and North-Western and the Chicago, Milwaukee and St Paul Railways, at an altitude of 802 feet. Its site is level and the plan irregular. It is in an agricultural region, and its manufactures consist largely of farming implements and machines, waggons and carriages. The Wisconsin school for the blind is situated here. Population (1890), 10,836; (1900), 13,185, of whom 2409 were foreign-born.

Janet, Paul (1823–1899), French philosophical writer, was born in Paris on 30th April 1823. He was professor of moral philosophy at Bourges (1845–48) and Strasburg (1848–57), and of logic at the Lycée de Louis le Grand, Paris (1857–64). In 1864 he was appointed to the chair of philosophy at the Sorbonne, and elected a member of the Academy of the Moral and Political Sciences. He wrote a large number of books and articles upon philosophy, politics, and ethics, on idealistic lines: *La Famille*, *Histoire de la Philosophie dans l'antiquité et dans le temps moderne*, *Histoire de la science politique*, *Philosophie de la Revolution Française*, &c. They are not characterized by much originality of thought. In philosophy he was a follower of Victor Cousin, and through him of Hegel. His principal work in this line, *Théorie de la morale*, is little more than a somewhat patronizing reproduction of Kant. He died in October 1899.

Jang Bahadur, Sir, MAHARAJA (1816–1877), ruler of Nepal, was a grand-nephew of Bhim Singh Thappa, the famous military minister of Nepal, who from 1804 to 1839 was *de facto* ruler of the state under the Queen Tripuri and her successor. Bhim Singh's supremacy was threatened by the Kala Pandis, and many of his relations, including Jang Bahadur, went into exile in 1838, thus escaping the cruel fate which overtook Bhim Singh in the following year. The Pandi leaders, who then reverted to power, were in turn assassinated in 1843, and Matabar Singh, uncle of Jang Bahadur, was created prime minister. He appointed his nephew general and chief judge, but shortly afterwards he was himself put to death. Fateh Jang thereon formed a ministry, of which Jang Bahadur was made military member. In the following year, 1846, a quarrel was fomented, in which Fateh Jang and thirty-two other chiefs were assassinated, and the queen appointed Jang Bahadur sole minister. The queen quickly changed her mind, and planned the death of her new minister, who at once appealed to the maharaja. But the plot failed. The

king and the queen wisely sought safety in India, and Jang Bahadur firmly established his own position by the removal of all dangerous rivals. He succeeded so well that in January 1850 he was able to leave for a visit to England, from which he did not return to Nepal until 6th February 1851. On his return, and frequently on subsequent dates, he frustrated conspiracies for his own assassination. The reform of the penal code, and a desultory war with Tibet, occupied his attention until news of the Indian Mutiny reached Nepal. Jang Bahadur resisted all overtures from the rebels, and sent a column to Gorakpur in July 1857. In December he furnished a force of 14,000 Gurkhas, which reached Lucknow on 11th March 1858, and took part in the siege. The moral support of the Nepalese was more valuable even than the military services rendered by them. Jang Bahadur was made a G.C.B., and a tract of country annexed in 1815 was restored to Nepal. Various frontier disputes were settled, and in 1875 Sir Jang Bahadur was on his way to England when he had a fall from his horse in Bombay and returned home. He received a visit from the prince of Wales in 1876. On 25th February 1877 he died, having reached the age of sixty-one. Three of his widows immolated themselves on his funeral pyre. (W. L.-W.)

Janina, or YANINA, capital of the vilayet of the same name, Albania, Turkey-in-Europe, on the west side of Lake Janina, 80 miles west of Larissa and 50 miles east of Corfu, the seat of a Greek archbishopric. Apart from the embroidery work of the women it has no special industry, and since 1881 its commercial importance has greatly diminished. Prior to the annexation of Thessaly to Greece a large proportion of the dealings in the grain produce of that province were transacted and settled in Janina. The export trade is now limited to cheese, hides, bitumen, and sheepskins, the annual value being about £120,000, and the import trade, valued at about double the export trade, to the supply of local wants. Population, 20,000.

Janiuay, a town in a beautiful valley near the centre of the province of Iloilo, island of Panay, Philippine Islands. The neighbouring country is hilly but fertile, producing rice, sugar, and tobacco; and wheat grows in the vicinity of the town. The women weave and sell beautiful fabrics of pineapple fibre, silk, cotton, and abacá. The language is Panay-Visayan. Population, 28,000.

Janjira, a native state of India, in the Konkan division of Bombay, situated along the coast among the spurs of the Western Ghats, 40 miles south of Bombay city. Area, 324 square miles. The population in 1881 was 76,361; in 1891, 81,780; average density, 252 persons per square mile. In 1901 the population was 85,392, showing an increase of 4 per cent. The estimated gross revenue is Rs.5,09,750, of which Rs.64,704 was expended on public works in 1897–98; no tribute; number of police, 135; number of schools, 60, with 3709 pupils. The chief, whose title is Nawab Saheb, is by descent a Sidi or Abyssinian Mahommedan; and his ancestors were for many generations admirals of the Mahommedan rulers of the Deccan. The present (1902) nawab was educated at the Rajkot college, and is K.C.I.E. He is entitled to a salute of nine guns. The state, popularly known as Habsan (=Abyssinian), did not come under direct subordination to the British until 1870. It supplies sailors and fishermen, and also firewood, to Bombay, with which it is in regular communication by steamer. The town of JANJIRA is merely a fortress on a small island of the same name, The principal seaport is Shrivardhan; population (1891), 7102. Murud had a population in 1891 of 5883. The Nawab of Janjira is also chief of the state of JAFARABAD, on the south coast of the peninsula of Kathiawar. Area, 42 square miles; population (1891), 12,389. The town of JAFARABAD is on the estuary of a little river, about a mile from the sea, and has considerable trade; population (1891), 5212.

Janssen, Pierre Charles César (1824–——), French astronomer, was born on 22nd February 1824 at Paris, and studied mathematics and physics at the Faculty of Sciences in that city. For some time he taught in the Lycée Charlemagne and the School of Architecture, but his life was mainly devoted to astronomical observations and especially to the study of the sun. In the pursuit of scientific knowledge he travelled all over the world. Thus in 1857 he went to Peru in order to determine the magnetic equator; in 1867 he carried out optical and magnetic observations at the Azores with Saint Claire Deville; in 1874 he visited Japan to view the transit of Venus; and he made several long expeditions to enjoy the opportunity for observations afforded by a total eclipse of the sun, *e.g.*, to Trani (1867), Guntoor (1868), Algiers (1870), Siam (1875), and the Caroline Islands (1883). To see the eclipse of 1870 he escaped from Paris, then invested by the German army, in a balloon. At the great Indian eclipse of 1868 he employed the spectroscope to reveal the nature of the red prominences as masses of glowing vapour, and devised a method (which was almost simultaneously thought of by several other astronomers) of observing them under ordinary conditions, when the sun's disk is not obscured by the moon. He also devoted much attention to the spectroscopic analysis of the sun's composition, particularly in reference to the question whether it contains oxygen or not. His efforts were directed towards eliminating, or getting an accurate estimate of, the disturbing effects of the oxygen in the earth's atmosphere, and his bold project of establishing an observatory on the top of Mont Blanc was prompted by a perception of the advantages to be gained by reducing the thickness of air through which observations have to be made. This observatory, the foundations of which were fixed in the snow that appears to cover the summit to a depth of ten metres, was built in September 1893, and Janssen, in spite of his sixty-nine years, made the ascent and spent four days taking observations. In 1875 he was appointed director of the astrophysical observatory which the French Government established in that year at Meudon.

Jaora, a native state of India, in the Malwa Agency. It lies in two isolated tracts, between Rutlam and Neemuch. Area, with the dependencies of Piplauda and Pant Piplauda, 581 square miles. The population in 1881 was 108,434; in 1891, 117,650, showing an increase of 8 per cent.; average density, 203 persons per square mile. The estimated revenue is Rs.8,00,000; subsidy for military contingent, Rs.1,61,810. The chief, whose title is Nawab, is a Mahommedan of Afghan descent. The late Nawab, who died in 1895, was an honorary major in the British army. His son was educated in the Daly College at Indore, with a British officer for his tutor. The administration is highly spoken of. There is an accumulated surplus of nearly Rs.3,00,000. The town of JAORA is on the Rajputana-Malwa railway, 20 miles north of Rutlam. Population (1881), 19,902; (1891), 21,844. It is well laid out, with many good modern buildings, and has a high school and dispensary. In 1897–98 the exports of opium amounted to 876 chests, on which the duty was Rs.4,94,650. To celebrate Queen Victoria's Diamond Jubilee, a Victoria Institute and a Zenana Dispensary were opened in 1898.

JAPAN.

I. Geography and Statistics.

Eastern Asia stretches two arms into the ocean, Kamchatka in the north, Malacca in the south, and between them lies a long, attenuated cluster of islands constituting the Japanese empire. On the extreme north are the Kuriles (called by the Japanese *Chishima*, or the "myriad isles"), which extend to east longitude 156° 32′ and to north latitude 50° 56′; and on the extreme south are the Pescadores (called by the Japanese *Hoko-tô*), which extend to east longitude 119° 20′ and to north latitude 21° 48′. Thus the islands of Japan cover 37° 12′ of longitude and 29° 8′ of latitude. There are five large islands, namely, Ezo, or Yezo, as it was called in the ninth edition of this work (which with the Kuriles is called *Hokkai-do*, or the north-sea district); Nippon (the "origin of the sun"), which is the main island; Shikoku (the "four provinces"), which lies on the east of the main island; Kiushiu (the "nine provinces"), which lies on the south of Nippon, and Formosa (called by the Japanese *Taiwan*), which forms the most southerly link of the chain. Formosa and the Pescadores were added to the empire after the victorious war with China in 1894–95. The following table shows the number, the lengths of coast-line in miles, and the areas in square miles of the various groups of islands, only those being indicated that have a coast-line of at least 1 *ri* (2½ miles), or those that, though of less development, are inhabited; except in the case of Formosa and the Pescadores, where the whole numbers are given:—

Position and extent.

	Number.	Length of Coast in miles.	Area in square miles.
Nippon	1	4,765·03	86,373·57
Isles adjacent to Nippon	166	1,275·09	470·30
Shikoku	1	1,100·85	6,861·39
Isles adjacent to Shikoku	74	548·12	175·40
Kiushiu	1	2,101·28	13,778·68
Isles adjacent to Kiushiu	150	2,405·06	1,821·85
Ezo	1	1,423·32	30,148·41
Isles adjacent to Ezo	12	110·24	30·51
Sado	1	130·05	335·92
Oki	4	182·27	130·40
Isle adjacent to Oki	1	3·09	0·06
Awaji	1	94·43	217·83
Isle adjacent to Awaji	1	5·32	0·83
Iki	1	86·47	50·96
Isle adjacent to Iki	1	4·41	0·47
Tsushima	1	454·49	261·94
Isles adjacent to Tsushima	5	454·49	261·94
Riukiu (or Loochoo Islands)	55	768·74	935·18
Chishima (Kuriles)	32	1,496·23	6,159·42
Ogasawara Islands (commonly called Bonin)	20	174·65	26·82
Taiwan (Formosa)	1	731·31	13,429·31
Isles adjacent to Formosa	29	128·32	not surveyed
Hoko-tô (Pescadores)	48	98·67	85·50
Totals	607	18,541·93	161,556·69

If the various islands of smaller dimensions than the above be included, a total of over 3000 in number is reached, but there has not been any absolutely accurate calculation of this figure.

Population. The population of the various parts of the empire was as follows on 31st December 1898:—

	Population.	Population per square mile.
Nippon[1]	33,327,935	380·0
Shikoku	3,013,817	430·0
Carry forward	36,341,752	387·0

[1] The figures include the population of the small isles adjacent to each of the islands indicated.

	Population.	Population per square mile.
Brought forward	36,341,752	387·0
Kiushiu	6,808,908	404·1
Hokkaido	610,155	15·5
Formosa	2,640,309	195·5
Hoko-tô (Pescadores)	49,787	582·3
Grand totals	46,450,911	288·0

The following figures show the rate of increase between the years 1889 and 1898:—

	Males.	Females.	Totals.
1889	20,246,336	19,825,684	40,072,020
1894	21,122,899	20,690,316	41,813,215
1898	22,072,057	21,688,149	43,760,815

According to historical records, the population of the empire in the year A.D. 610 was 4,988,842, and in 736 it had grown to 8,631,770. It is impossible to say how much reliance may be placed on these figures, but from the 18th century, when the name of every subject had to be inscribed in the roll of a temple as a measure against his adoption of Christianity, a tolerably trustworthy census could always be taken. The returns thus obtained show that from the year 1723 until 1846 the population remained almost stationary, the figure in the former year being 26,065,422, and that in the latter year 26,907,625. There had, indeed, been five periods of declining population in that interval of 124 years, namely, the periods 1738–44, 1759–62, 1773–74, 1791–92, and 1844–46. But after 1872, when the census showed a total of 33,110,825, the population grew steadily, its increment between 1872 and 1898 inclusive, a period of 27 years, being 10,649,990. Such a rate of increase invests the question of subsistence with great importance. In former times the area of land under cultivation increased in a marked degree. Returns prepared at the beginning of the 10th century showed 2½ million acres under crops, whereas the figure in 1834 was over 8 million acres. But the development of means of subsistence has been signally outstripped by the growth of population during recent years. Thus, during the ten-years period 1888–97, the population received an increment of 4,089,964, or over 10 per cent., whereas the food-producing area remained almost stationary. Indeed, there was reason to think that in 1901 Japan proper, as distinguished from the northern island of Ezo, had nearly reached the limit of her capacity for the production of food-stuffs, and that her people would henceforth become more and more dependent upon supplies from abroad, for it was plain that, under the greatly improved conditions of life resulting from the enlightened government of the *Meiji* era, a steady growth of population was to be anticipated.

Divided according to castes, the population groups itself as follows:—

	Heads of Families.	Members of Families.
Nobility (*kwazoku*)	706	3,845
Former *samurai* (*shizoku*)	439,386	1,666,310
Commoners (*heimin*)	8,179,704	33,470,864

The following table shows the number of marriages and divorces in Japan in 1889 and 1898:—

	Marriages.	Marriages per 1000 of Population.	Divorces.	Divorces per 100 of Population.
1889	340,445	8·50	107,478	2·68
1898	471,217	10·77	99,469	2·27

The fact that, speaking roughly, one divorce takes place for every four marriages, has often evoked severe comment from foreign critics. But it should be observed that the causes of divorce in Japan differ from those operative in Europe. The great majority of marriages among the lower orders are merely arrangements designed to test a couple's suitability to each other as helpmates in the struggle of life. If experience shows incompatibility of temper or any other mutually repellent disposition, divorce follows as a matter of course. On the other hand, divorces among persons of the upper classes are comparatively rare, and divorces on account of a wife's unfaithfulness are almost unknown.

The number of households in Japan at the close of 1898 was 8,175,208, and it follows that the average number of persons per household was 5·35.

The number of births per 100 inhabitants during the decade ended 1898 varied from 2·99 to 3·14—the male children averaging 104 to every 100 female—and the number of deaths per 100 inhabitants varied from 2·04 to 2·28. Illegitimate births exhibit an evident tendency to increase, as may be seen from the figures for the five years ended 1898:—

	Illegitimate Births.	Number per 100 of population.
1894	76,407	0·182
1895	80,168	0·189
1896	84,479	0·198
1897	90,128	0·208
1898	108,485	0·248

The Japanese show a steadily growing disposition to visit foreign countries. In 1889 the number residing abroad was only 18,688, whereas in 1898 it was 70,801. The bulk of that increase was due to emigration to Hawaii, where 36,000 Japanese are now employed on the sugar plantations, and to settling in Korea, where the Japanese residents increased from 5589 in 1889 to 15,309 in 1898. The Australian colonies, especially Queensland, also attract Japanese enterprise—there were 6000 Japanese living there in 1898, against only 450 ten years previously,—and more than 3000 find employment in Russian colonies.

If the Chinese element be excepted, the number of foreigners residing in Japan underwent little change during the period 1889–99, as the following figures show:—

Foreigners residing in Japan.

	1889.	1899.
Americans	899	1,296
British	1,701	2,013
Russians	63	134
Dutch	85	85
French	335	463
Portuguese	108	158
Germans	550	532
Peruvians	...	3
Swiss	57	94
Belgians	31	26
Italians	37	51
Danes	79	59
Swedes and Norwegians	33	42
Spaniards	15	50
Brazilians	...	1
Austro-Hungarians	56	83
Hawaiians	16	...
Chinese	4,975	6,372
Koreans	8	188
Greeks	...	1
Australians	1	...
Mexicans	...	3
Canadians	13	...
Others	...	30
	9,062	11,684

This slow growth of the foreign residents is remarkable when contrasted with the fact that the volume of the country's foreign trade, which constitutes the business in which they are engaged, grew in the same period from 136 million *yen*[1] to 443 millions. It may be added that out of 11,589 foreigners residing in Japan at the close of 1898, the number engaged in commerce and other professions was 10,654; the number in the service of the Government was 100, and the number in the service of private companies, institutions, &c., was 718, the remainder being officials.

In 1898 there were 21 towns in Japan having a population of over 50,000. They were as follows:—

Urban Populations.

Tôkyô	1,440,121	persons
Osaka	821,235	,,
Kyôtô	353,139	,,
Nagoya	244,145	,,
Kobe	215,780	,,
Yokohama	193,762	,,
Hiroshima	122,306	,,
Nagasaki	107,422	,,
Kanazawa	83,595	,,
Sendai	83,325	,,
Hakodate	78,040	,,
Fukuoka	66,190	,,
Wakayama	63,667	,,
Tokushima	61,501	,,
Kumamoto	61,463	,,
Toyama	59,558	,,
Okayama	58,025	,,
Otaru	56,961	,,
Kagoshima	53,481	,,
Niigata	53,366	,,
Sakai	50,203	,,

The first three on the above list, namely, Tôkyô, Osaka, and Kyôtô, are called "cities" (*fu*), the remainder being "towns" (*shi*). The number of towns having a population of over 20,000 is 76.

Mountains.

The Japanese islands may be said to be traversed throughout their entire length from north to south by a range of mountains forming a kind of backbone, which sends out lateral branches at various places. A special feature is that lofty summits are separated by comparatively low passes, owing to the fact that the latter lie at the level of crystalline rocks and schists constituting the original uplands upon which the summits have been piled by volcanic action. The scenery among the mountains is generally soft. Time's influence has been so strongly assisted by climatic agencies that everything rugged or abrupt has been smoothed and modified, until an impression of gentle undulation rather than of grandeur or boldness is suggested. Nowhere is the region of eternal snow reached, and seldom are masses of tender and varied foliage wanting to enhance the gentle aspect of the scenery and glorify it in autumn with tints of striking brilliancy and diversity. Extensive plains are exceptional. As a general rule, mountain alternates with valley, so that not more than one-eighth of the country's entire area is cultivable.

Fuji.

The king of Japanese mountains is Fuji-san (Peerless Mount), of which the highest point (Ken-ga-mine) is 12,395 feet above sea-level. The remarkable grace of this mountain's curve—it has been mathematically shown to be an inverted catenary—renders it one of the most beautiful objects of its kind in the world, and has obtained for it a prominent place in the field of Japanese decorative art. Great streams of lava flowed from the crater in ancient times. The course of one is still visible to a distance of 15 miles from the summit, but the rest are covered, for the most part, with deep deposits of ashes and scoriæ. On the south Fujiyama slopes unbroken to the sea, but on the other three sides the plain from which it rises is surrounded by mountains, among which, on the north and west, a series

[1] The *yen* is the Japanese monetary unit. It is equal to a fraction over 2 shillings sterling, or 50 cents (gold).

of most picturesque lakes has been formed in consequence of the ashes ejected from Fuji's crater damming the waters of the rivers. To a height of some 1500 feet the slopes of the mountain are cultivated; a grassy moorland stretches up the next 2500 feet; then follows a forest, the upper edge of which climbs to an altitude of nearly 8000 feet on one side, and finally there is a wide area of ashes and scoriæ. There is entire absence of the Alpine plants found abundantly on the summits of other high mountains in Japan, a fact due, doubtless, to the comparatively recent activity of the volcano. The ascent of Fuji presents no difficulties. A traveller can reach the usual point of departure, Gotemba, by rail from Yokohama, and thence the ascent and descent may be made in one day by a sturdy pedestrian, though two days are generally allotted to the task.

The Japanese Alps.

The provinces of Hida and Etchiu are bounded on the east by a chain of mountains, including, or having in their immediate vicinity, the highest peaks in Japan after Fuji. Six of these summits rise to a height of 9000 feet or upwards, and constitute the most imposing assemblage of mountains in Japan. The ridge from which they push their heads runs due north and south through a length of from 60 to 70 miles, and has a width of from 5 to 10 miles. It is mostly of granite, only two of the mountains—Norikura and Tateyama—showing clear traces of volcanic origin. The lower flanks of the ridge are clothed with forests of beech, conifers, and oak. Farther south, in the same range, stands Ontake, the second highest mountain in Japan proper, as distinguished from Formosa; and other remarkable though not so lofty peaks distinguish the same regions. This grand group of mountains has been well called the "Alps of Japan," and a good account of their features may be found in a book (*The Japanese Alps*) compiled by the Rev. W. Weston. On the summit of Ontake are eight large and several small craters, and there also may be seen displays of trance and "divine possession," such as are described by Mr Percival Lowell in *Occult Japan*.

The Nikko mountains.

Even more interesting and more picturesque, though less lofty, than the Alps of Japan, are the Nikkô mountains, celebrated as enclosing the mausolea of the two greatest of the Tokugawa Shoguns. The highest of these peaks are Shirane-san (7491 feet), Nantai-san (8169 feet), Nyohô-zan (8100 feet), and Omanago (7546 feet). They are clothed, for the most part, with magnificent vegetation, and everywhere they echo the voices of waterfalls and rivulets.

Mountains of the north.

In the north of the main island there are no peaks of remarkable height. The best known are Chôkai-zan, called "Akita Fuji" (the Fuji of Akita province), a volcano 7081 feet high, which was active as late as 1861; Ganju-san (7447 feet), called also "Nambu Fuji" or Iwate-zan, remarkable for the beauty of its logarithmic curves; Iwaki-san (4650 feet), known as Tsugaru-Fuji, and said by some to be even more imposing than the Peerless Mountain itself; and the twin mountain Gassan (6447 feet) and Haguro-san (5600 feet). A little farther south, enclosing the fertile plain of Aizu (Aizu-taira, as it is called), several important peaks are found, among them being Iide-san (6169 feet); Azuma-yama (6473 feet), a mountain which, after a long interval of quiescence, has given many evidences of volcanic activity during recent years; Nasu-dake (6286 feet), an active volcano; and Bandai-san (6444 feet). A terrible interest attaches to the last-named mountain, for, after having remained quiet for a time so long as to lull the inhabitants of the neighbouring district into complete security, it suddenly burst into fierce activity on 15th July 1888, discharging a vast avalanche of earth and rock, which dashed down the slopes of the mountain like an inundation, burying four hamlets, partially destroying seven villages, killing 461 people, and devastating an area of 27 square miles.

Mountains of Kôtsuke, Kai, and Shinano.

In the province of Kôtsuke, which belongs to the central part of the main island, the noteworthy mountains are Asama-yama (8136 feet), one of the best known and most violently active volcanoes of Japan; Akagi-san, a circular range of peaks surrounding the basin of an old crater and rising to a height of 6210 feet; the Haruna group, celebrated for scenic beauties, and Myogi-san, a cluster of pinnacles which, though not rising higher than 3880 feet, offer scenery wholly different from anything to be seen elsewhere in Japan; scenery which dispels the delusion that nature, as represented in the classical pictures (*bunjin-gwa*) of China and Japan, exists only in the artist's imagination. Farther south, in the province of Kai (Kôshiu), and separating two great rivers, the Fuji-kawa and the Tenryu-gawa, there lies a range of hills with peaks second only to those of the Japanese Alps spoken of above. The principal elevations in this range are Shirane-san (different from the mountain of the same name in the Nikkô group)—with three summits, Nôdori (9970 feet), Ai-no-take (10,200 feet), and Kaigane (10,330 feet)—and Hôôzan (9550 feet). It will be observed that all the highest mountains of Japan form a species of belt across the widest part of the main island, commencing on the west with the "Alps" of Etchiu, Hida, and Shinano, and ending on the east with Fuji-yama. In all the regions of the main island southward of this belt the only mountains of conspicuous altitude are Omine (6169 feet) in Yamato, Odai-yama (5540 feet) in the same province, and Daisen or Oyama (5951 feet) in Hôki.

Mountains of Shikoku.

The island of Shikoku has no mountains of notable magnitude. The highest is Ishitsuchi-yama (7743 feet), but there are several peaks varying from 3000 to 6000 feet.

Mountains of Kiushiu.

Kiushiu, though abounding in mountain chains, independent or connected, is not remarkable for lofty peaks. In the neighbourhood of Nagasaki, over the celebrated solfataras of Unzen (called also Onsen), stands an extinct volcano, whose summit, Fugen-dake, is 4800 feet high. More notable is Aso-san, some 20 miles from Kumamoto; for though the highest of its five peaks has an altitude of only 5544 feet, it boasts the largest crater in the world, with walls nearly 200 feet high and a basin from 10 to 14 miles in diameter. Aso-san is still an active volcano, but its eruptions during recent years have been confined to ashes and dust. Only two other mountains in Kiushiu need be mentioned—a volcano (4000 feet high) on the island Sakura-jima, in the extreme south; and Kirishima-yama (5528 feet), on the boundary of Hyûga, a mountain specially sacred in Japanese eyes, because on its eastern peak (Takachiho-dake) the god Ninigi is believed to have descended as the forerunner of the first Japanese sovereign, Jimmu.

The following list shows the principal mountains of Japan in the order of their altitudes, as well as the provinces in which they are situated:—

	Height in feet.	Province.
Niitake-yama (Mt. Morrison) .	14,350	Formosa.
Setsuri-san (Mt. Sylvia) . .	12,800	Formosa.
Fuji-san	12,395	Suruga.
Ontake	10,446	Shinano.
Norikura-dake.	10,387	Hida.
Shirane-san	10,330	Kai.
Akaishi-yama	10,147	Shinano.
Yariga-dake	10,144	Hida.
Orenge-yama	9,977	Etchiu.
Komaga-take	9,842	Kai.

	Height in feet.	Province.
Yakushi-dake	9,816	Kai.
Yatsuga-dake	9,612	Kai.
Tate-yama	9,186	Etchiu.
Kokushi-dake	8,438	Shinano.
Kimpu-san	8,369	Kai.
Yariga-mine	8,369	Etchiu and Hida.
Tateshima-yama	8,300	Shinano.
Iwasugo-yama	8,251	Shinano.
Nantai-san	8,169	Shimotsuke.
Asama-yama	8,136	Shinano.
Nyohô-zan	8,100	Shimotsuke.
Kabushi-dake	8,064	Kai.
Myôkô-zan	8,051	Echigo.
Takatsuma-yama	7,956	Echigo.
Yake-yama	7,906	Echigo.
Cha-cha-nobori	7,900	Kuriles.
Ena-san	7,874	Mino.
Hiuchi-dake	7,816	Iwashiro.
Haku-san	7,797	Kaga.
Ishitsuchi-yama	7,743	Iyo.
Azuma-yama	7,733	Shinano.
Daimugen-yama	7,647	Suruga.
Omanago	7,546	Shimotsuke.
Akanagi-san	7,513	Shimotsuke.
Shirane-san	7,491	Kôtsuke.
Ganju-san	7,447	Rikuchiu.
Tsurugi-san	7,355	Awa.
Chôkai-san	7,081	Ugo.
Kuroboshi-yama	7,047	Tôtômi.

Rivers. Japan is abundantly watered. Indeed, there is probably no other country in the world that possesses a closer network of streams, supplemented by canals and lakes. But the quantity of water carried seawards by these numerous rivers varies within wide limits; for whereas, during the rainy season in summer and while the snows of winter are melting in spring, great volumes of water sweep down from the mountains, these broad rivers dwindle at other times to petty rivulets trickling among a waste of pebbles and boulders. Neither are there any long rivers, as compared with Occidental figures, and all are so broken by shallows and rapids that navigation is generally impossible except by means of flat-bottomed boats drawing only a few inches. The chief rivers are given in the above table. There are eleven other rivers—the Iwata, the Ota, the Abashiri, the Shônai, the Iwaki, the Midori, the Yodo, the Hei, the Takatsu, the Watari, and the Abe—varying in length from 59 to 49 miles, in the order here set down, but they are not of sufficient importance to warrant fuller notice.

	Length in miles.	Source.	Point of Exit.
Ishikari-gawa	407 (?)	Ishikari-dake	Otaru.
Shinano-gawa	215	Kimpu-zan	Niigata
Teshio-gawa	192	Teshio-dake	Sea of Japan.
Tone-gawa	177	Monju-zan Kôtsuke	Choshi (Shimosa).
Mogami-gawa	151	Dainichi-dake (Uzen)	Sakata.
Yoshino-gawa	149	Yahazu-yama (Tosa)	Tokushima (Awa).
Kitakami-gawa	146	Nakayama-dake (Rikuchiu)	Ishinomaki (Rikuzen).
Tenryu-gawa	136	Suwako (Shinano)	Tôtômi Bay.
Go-kawa or Iwame-gawa	122	Maruse-yama (Bingo)	Iwami Bay.
Abukuma-gawa	122	Asahi-dake (Iwashiro)	Matsushima Bay.
Tokachi-gawa	120	Tokachi-dake	Tokachi Bay.
Sendai-gawa	112	Kunimi-zan (Hyûga)	Kumizaki (Satsuma).
Oi-gawa	112	Shirane-zan (Kai)	Suruga Bay.
Kiso-gawa	112	Kiso-san (Shinano)	Bay of Ise.
Ara-kawa	104	Chichibu-yama	Tôkyô Bay.
Naga-gawa	102	Nasu-no-yama (Shimotsuke)	Naka-no-minato (Hitachi).
Aka-no-gawa	97	Osenuma (Kôtsuke) and Inawashiro Lake	Matsugasaki (Echigo).
Imizu-gawa	93	Dainichi-dake (Mino)	Fushiki (Etchiu).
Jinzu-gawa	93	Norikura-dake (Hida)	Toyama (Etchiu).
Tama-gawa	92	Daibosatsu-toge (Kai)	Haneda (Tôkyô Bay).
Asahi-gawa (called also Nishi-O-kawa)	90	Mimasaka (N.W.)	Kojima Bay.
Shiribeshi-gawa	88	Shiribeshi-dake	Suttsu Bay.
Ki-no-kawa	85	Odai-san (Yamato)	Wakayama.
Shingû-gawa	85	Yoshino-san (Yamato)	Shingû (Kii).
Chikugo-gawa	85	Bungo and a second source in Higo	Chikushi Bay.
Fuji-kawa	85	Yatsuga-dake (Kai)	Suruga Bay.
Ono-gawa	83	Aso-san (Higo)	Oita (Bungo).
Kushiro-gawa	81	Kushiro-numa	Kushiro.
Miya-kawa	78	Odai-san (Yamato)	Ise Bay.
Kuzuryu-gawa	78	Mino	Fukui (Echizen).
Yahagi-gawa	78	Shinano	Chita Bay (Owari).
Hitaka-gawa	76	Kôya-san	Kii Bay.
Banyû-gawa	75	Yamanaka Lake (Kai)	Sagami Bay.
Yoshii-gawa (called also Higashi-O-kawa)	75	Mimasaka (N.)	Kajima Bay.
Yura-kawa	74	Wakasa	Tango Bay.
Omono-gawa	73	Kurikoma-dake (Rikuzen)	Tsuchizaki (Akita)
Naka-gawa	68	Tsurugi-san	South of Awaji.
Takahashi-gawa	68	Border of Izumo	Kurashiki (Bitchiu).
Koko-gawa	68	Tamba	Harima Bay.
Mimizu-gawa	68	Border of Higo	Hyûga Bay.
Toshibetsu-gawa	64	Toshibetsu	Sea of Japan.
Yûbetsu-gawa	64	Kitami plains	Northern Sea.
Nyodo-gawa	64	Iyo	Tosa Bay.
Oyodo-gawa	61	Kirishima-yama	Miyazaki.
Monobe-gawa	61	Border of Awa	Tosa Bay.
Naruse-gawa	61	Border of Uzen	Nobiru.
Nojiro-gawa	61	Osaru-zan (Rikuchiu)	Nojiro (Ugo).
Mabechi-gawa	61	Border of Rikuchiu	Hachinohe (Mutsu).
Kuma-gawa	59	Border of Hyûga	Yatsushiro.

Lakes and waterfalls. Japan has many lakes, remarkable for the beauty of their scenery rather than for their extent. Some are contained in alluvial depressions in the river valleys; others have been formed by volcanic eruptions, the ejectamenta damming the courses of the rivers and piling up their waters until exits were found over cliffs or through gorges. Some of these lakes have become favourite summer resorts for foreigners touring or residing in Japan. To that category belong especially the lakes of Hakone, of Chiusenji, of Shôji, of Inawashiro, and of Omi. Among these the highest is Lake Chiusenji, which is 4375 feet above sea-level, has a maximum depth of 93 fathoms, and empties itself at one end over a fall (Kegon) 250 feet high. The Shôji lakes lie at a height of 3160 feet, and their neighbourhood abounds in scenic charms; Lake Hakone is at a height of 2428 feet; Inawashiro, at a height of 1920 feet; and Omi, at a height of 328 feet. The Japanese associate Lake Omi with eight views of special loveliness (*Omi-no-hakkei*). Lake Suwo, in Shirano, which is emptied by the Tenryu-gawa, has a height of 2624 feet. In the vicinity of many of these mountain lakes thermal springs, with remarkable curative properties, are to be found, and there can be no doubt that among the features of Japan's future will be the establishment of health-resorts in regions offering so many attractions. The names and sizes of the principal lakes, so far as they have been surveyed, are as follow:—

Name.	Circumference in miles.
In the Tôkaidô Region.	
Ashi-no-ko[1] (Lake Hakone in Sagami)	11·78
Inba-numa (Shimosa)	29·28
Tega-numa (Shimosa)	...
Kasumi-ga-ura (Hitachi)	87·89
Kita-ura (Hitachi)	36·60
Kare-numa (Hitachi)	...
Ushiku-numa (Hitachi)	...
Kawaguchi-ko (Kai)	...
Nishino-umi (Kai)	...
Yamanaka-ko (Kai)	...
Motosu-ko (Kai)	...
Shôji-ko (Kai)	...

Meteorology. There are seventy-four meteorological stations in the Japanese empire, whence reports are constantly forwarded by telegraph to the central observatory in Tôkyô, and the latter issues daily statements of the climatic conditions during the previous twenty-four hours, as well as forecasts of the weather during the next twenty-four. The whole country is divided into seven districts for meteorological purposes, and storm-warnings are addressed to one or more of the divisions when such a precaution is judged necessary. At the most important stations observations are taken every hour; at the less important, six observations daily; and at the least important, three observations. This work is carried on by Japanese experts solely. Hitherto no attempt has been made to strike averages of the observations covering a number of years; but as without such averages no trustworthy deduction can be drawn, the reports of the observatories for the ten years ending 1900 are now collated to form the following table:—

AVERAGES OF METEOROLOGICAL OBSERVATIONS.

	Atmospheric Pressure.			Temperature of the Air.			Mean of the Tension of Vapours in the Air.	Mean of the Humidity of Air per cent.	Quantity of Rain and Snow.		Number of Days.									Velocity of Wind per second.	
	Mean Normal.	Max. Absolute.	Min. Absolute.	Mean Normal.	Max. Absolute.	Min. Absolute.			Total Quantity.	Max. in 24 hours.	Rain, Snow, Hail.	Snow.	Hail.	Thunder.	Fog.	Frost.	Clear Sky.	Cloudy Sky.	Tempestuous.	Mean Velocity in 24 hrs.	Max. of Velocity.

N.B.—For the first five places in the above list the averages cover 10 years; for the next seven—from Kagoshima to Nemuro inclusive—they cover 7 years; for the next five places—from Wakayama to Sapporo inclusive—they cover 3 years; and for the last five places they cover 2 years. The quantity of rain and snow is the total height of the water collected at the hours of observations without taking count of duration. The number of days of rain, snow, &c., is reckoned for a period of 24 hours since the last observation, whatever may have been the duration of the phenomena, and a fall of rain, snow, or hail less than $\frac{1}{10}$th of a millimetre is not taken into account. The columns of snow and hail include all the days when these phenomena presented themselves in the above degree, and consequently these days are repeated in the three columns. As to foggy days, a thick fog is to be understood. For calculating cloudiness the standard 10 is taken, a cipher indicating absolute cloudlessness, and 10 a completely overcast sky. A "clear day" is when the quantity of cloud does not exceed 2 according to this scale, all other days being counted cloudy. A tempestuous day is when the velocity of the wind exceeds 2 metres per second. The temperatures in the table are centigrade.

The tables on the next page afford data for comparing the climates of Peking, Shanghai, Hakodate, Tôkyô, and San Francisco.

Climate. As might be expected from the large extension of the Japanese islands in a northerly and southerly direction, great varieties of climate exist. As general characteristics may be mentioned hot and humid though short summers, and long, cold, and clear winters. The equatorial currents laving the shores of the islands produce conditions differing from those existing at corresponding latitudes on the neighbouring continent. In Kiushiu, Shikoku, and the southern half of the main island, the months of July and August alone are marked by inconvenient heat at the sea-level, while in elevated districts a cool and even bracing temperature may always be found, though the direct rays of the sun retain inconvenient power. Winter, also, in these districts does not last more than two months, from the end of December to the beginning of March; for although the latter month is not free from frost, and even snow, the balminess of spring makes itself plainly perceptible. On the other hand, in the northern half of the main island, in Ezo and in the Kuriles, the cold is severe during the winter, which lasts for at least four months, and snow falls sometimes to great depths. This may be illustrated by saying that whereas in Tôkyô the number of frosty nights during a year does not average much over 60, the corresponding number in Sapporo or

the north-west of Ezo is 145. But the variation of the thermometer in winter and summer being considerable—as much as 40° C. in Tôkyô—the climate proves somewhat trying to persons of weak constitution. On the

	Longitude.	Latitude.	Mean Temp.
Peking . . .	116° 29′ E.	39° 57′ N.	11° 48′ [1]
Shanghai . .	121° 20′ E.	31° 12′ N.	15° 12′
Hakodate . .	140° 45′ E.	41° 46′ N.	8° 6′
Tôkyô . . .	139° 47′ E.	35° 41′ N.	13° 54′
San Francisco . .	122° 25′ E.	37° 48′ N.	13° 30′

	Hottest Month.	Mean Temp. of Hottest Month.
Peking	July	26° 6′
Shanghai . . .	,,	28° 6′
Hakodate . . .	August	21° 44′
Tôkyô	,,	26° 24′
San Francisco . .	September	16° 12′

	Coldest Month.	Mean Temp. of Coldest Month.	Difference.
Peking . .	January	−4° 36′	30° 42′
Shanghai . .	,,	−3° 30′	31° 36′
Hakodate . .	,,	−2° 36′	24° 0′
Tôkyô . . .	,,	2° 24′	24° 0′
San Francisco .	,,	9° 48′	6° 48′

other hand, the mean daily variation is in general less than in other countries having the same latitude: it is greatest in January, when it reaches 10° C., and least in July, when it barely exceeds 5° C. The monthly variation is very great in March, when it usually reaches 24° C.

There are two wet seasons in Central Japan, each of six weeks' duration, the first commencing in June, the second in September. Between these seasons are the dog days (*doyo*), from the middle of July till the second half of August. September is the wettest month; January the driest. During the four months from November to February inclusive only about 18 per cent. falls of the whole rain for the year. In the districts on the east of the main island the snowfall is insignificant, seldom attaining a depth of more than four or five inches, and generally melting in a few days, while bright, sunny skies are usual. But in the mountainous provinces of the interior and in those along the western coast, deep snow covers the ground throughout the whole winter, and the sky is usually wrapped in a veil of clouds. These differences are due to the action of the north-westerly wind that blows over Japan from Siberia. The intervening sea being comparatively warm, this wind arrives at Japan having its temperature increased and carrying moisture which it deposits as snow on the western faces of the Japanese mountains. Crossing the mountains and descending their eastern slopes, the wind becomes less saturated and warmer, so that the formation of clouds ceases.

Railways.—The work of railway building was commenced by the *Meiji* Government in 1869, and the first line—that between Tôkyô and Yokohama, a distance of 18 miles—was opened for traffic in 1872. But private capitalists showed no inclination to engage in such enterprise, and when at length in 1888 a company—the *Nippon Tetsudo Kaisha* (Japan Railway Company)—was projected, its organization could not be completed until the Treasury guaranteed 8 per cent. on the paid-up capital for 15 years. Progress was slow at first, so that in 1888 the total length of lines in operation was only 318 miles, of which 205 miles had been built by the Government and 113 by private enterprise. Thenceforth the work of construction proceeded more rapidly, so that the average annual addition made to private lines until the close of 1899 was 208 miles, and that made to State lines, 40 miles.

[1] The temperatures are centigrade.

The total length of lines open for traffic at the end of 1899 was 3639 miles, of which 833 miles had been constructed by the State and 2806 miles by private companies. The expenditure on account of State lines had been 70 million *yen* in round numbers, or 84,034 *yen* per mile; and that on account of private lines, 187 millions (including debentures and loans), or 66,286 *yen* per mile. The difference in cost of construction is explained by the facts that portions of the State lines were built before experience had indicated cheap methods; that extensive works for carriage-building, repairs of locomotives, &c., are connected with the Government lines, and that it fell to the lot of the State to undertake lines running through districts that present exceptional engineering difficulties, such districts being naturally avoided by private companies. The number of passengers and the quantity of goods carried over all the lines during 1899 were 102,115,942 and 18,820,034 tons respectively; the gross earnings amounted to 38,219,272 *yen*, and the working expenses to 18,833,217 *yen*, leaving a net profit of 19,386,055 *yen*. Thus the working expenses represented 49 per cent. of the earnings and the net profits averaged a little over 7½ per cent. of the invested capital.

The Government programme involves the construction of 1230 miles of new railways, and private companies—which number 103 in all—have obtained charters for building 961 miles, the former work involving an outlay of 114½ million *yen*, and the latter an outlay of 60 millions. Thus the lines in operation and projected total 5830 miles, and the capital involved aggregates 431½ million *yen*.

The programme of railway construction, as originally planned and subsequently carried out in great part, had for its basis a grand trunk line extending the whole length of the main island from Aomori on the north to Shimonoseki on the south, a distance of 1153 miles; and a continuation of the same line throughout the length of the southern island of Kiushiu, from Moji on the north—which lies on the opposite side of the strait from Shimonoseki—to Kagoshima on the south, a distance of 232¾ miles; as well as a line from Moji to Nagasaki, a distance of 163½ miles. Of this main road the State undertook to build the central section (376 miles), between Tôkyô and Kobe (*viâ* Kyôtô); the Japan Railway Company undertook the portion (457 miles) northward of Tôkyô to Awomori; the Sanyo Railway Company undertook the portion (320 miles) southward of Tôkyô to Shimonoseki; and the Kiushiu Railway Company undertook the lines in Kiushiu. The whole line is now in operation, with the exception of two sections, measuring 45¼ miles and 89¼ miles respectively, namely, the part of the Sanyo railway between Mitajiri and Shimonoseki, and the part of the Kiushiu railway between Kumamoto and Kagoshima. It is not literally correct to say that this main trunk line has been constructed as originally planned. The first project was to carry the Tôkyô–Kyôtô line through the interior of the island so as to secure it against enterprises on the part of a maritime enemy. Such engineering difficulties presented themselves, however, that the coast route was ultimately chosen, and though the line through the interior was subsequently constructed, strategical considerations have not been allowed to govern its direction completely.

When Japan began to build railways, much discussion was taking place in England and India as to the relative advantages of the wide and narrow gauges, and so strongly did the arguments in favour of the metre gauge appeal to the Indian Government that it adopted the latter in 1873, although some 5000 miles of wide-gauge roads had already been built. The English advisers of the Japanese Government maintained similar views, and it resulted that the

metre (3 feet 6 inches) gauge was chosen. Some fitful efforts made in later years to change the system proved unsuccessful, and there is now little reason to foresee any departure from the metre gauge. The lines, too, are single, for the most part: only 250 miles of double track exist out of the 3639 miles of line that have been built; and as the embankments, the cuttings, the culverts, and the bridge-piers have not been constructed for a double line, any change now would be very costly. The average speed of passenger trains in Japan is 18 miles an hour, the corresponding figure over the metre-gauge roads in India being 16 miles, and the figure for English parliamentary trains from 19 to 28 miles. British engineers surveyed the routes for the first lines and superintended the work of construction, but within a few years the Japanese were able to dispense with foreign aid altogether, both in building and operating their railways. They also construct carriages and waggons, but not locomotives, for though one was successfully built at the Kobe workshops under the superintendence of a British engineer, the enterprise did not continue. The lines are well ballasted, but the carriages are not comfortable, and the points and signal arrangements are of old patterns. Nevertheless there is tolerable immunity from accidents and irregularities, and seeing that the working expenses average only 49 per cent. of the gross earnings, whereas the corresponding figure in England is 55, it can scarcely be doubted that the management is efficient.

Central civil administration.

The central administration of public affairs is carried on by a cabinet, under the personal direction of the Sovereign, and by nine State departments, namely, those of foreign affairs, home affairs, finance, war, the navy, justice, education, agriculture, and commerce. The heads of these departments are called "ministers of State." They form a cabinet, under the direction of a minister president of State. Thus the cabinet numbers ten members, exclusive of the Emperor. Each department has a parliamentary and a permanent vice-minister, and is divided into bureaux presided over by chiefs. There is a privy council, charged with the duty of advising the Sovereign upon all questions submitted to it; and there are also a board of audit, which discharges important functions with regard to the public accounts; an administrative court, which takes cognizance of all legal questions connected with officials; and an administrative bureau of the House of Peers, as well as one of the House of Representatives. The affairs of the Imperial household and of the Imperial estates are managed by a household department under a minister, who has not a seat in the cabinet and is independent of ministerial vicissitudes. As a general rule, the portfolios of war and of the navy have changed hands on occasions of cabinet changes, but there is a growing tendency to invest these portfolios with a technical character and to make their tenure independent of the cabinet's life. Under the control of the central administration, though not forming an integral part of it, are the bureau of Tôkyô police, the Hokkaido bureau, the governors of prefectures and their staffs, and the government of Formosa.

Officials.

Japanese officials are divided into four classes: the first comprising those that receive their commissions directly from the Emperor and are entitled to report personally to him; the second, those that receive their commissions through the minister of a department and have the *entrée* to the palace on State occasions; the third, those commissioned similarly to the second class, but not having the *entrée* to the palace; and the fourth, those temporarily engaged and having the status of mere employés. There is also another classification into nine ranks, each having two grades. The place occupied by an official in this list is granted by the Emperor as a recognition of merit, and the designation is prefixed to the name, like a title, in official documents. Thus *Shô-ni-i Kôshaku Itô*, "First-grade second rank Marquis Itô"; or *Jû-sanmi Danshaku Iwakura*, "Second-grade third rank Baron Iwakura." Admission to officialdom is by examination, except in the case of candidates possessing certain duly attested educational qualifications.

The following table shows the number of officials belonging to the central Government and their respective emoluments:—

Officials.	Total Number.	Total Yearly Emoluments. Yen.	Average Yearly Emoluments. Yen.
First-class .	259	1,010,540	3,962 (£397)
Second-class .	4,269	4,296,208	1,006 (£101)
Third-class .	38,082	9,094,462	238 (£24)
Fourth-class .	26,266	4,186,500	159 (£16)
Totals .	68,876	18,587,710	269 (£27)

There has been of late years a steady tendency towards increase in the number of central Government officials. In 1893 the total was only 45,508, against 68,876 at present, and the emoluments aggregated 10,745,348 *yen*, whereas they now aggregate 18,587,710 *yen*.

Local administration.

For purposes of local administration the whole empire is divided into 47 prefectures (*ken*); 653 counties (*gun*); 48 towns (*shi*), and 14,734 districts (*cho* or *son*). The three metropolitan prefectures of Tôkyô, Osaka, and Kyôtô are called *fu*, and the districts are divided into "urban" (*cho*) and "rural" (*son*), according to the number of houses they contain. The prefectures are named after their chief towns, except in the case of Hokkaido and Okinawa. The names of the prefectures, with their population and superficies, are as follow:—

Prefecture.	Area in square miles.	Population.
Tôkyô	749·76	1,507,642[1]
Kanagawa . . .	927·79	776,642
Saitama . . .	1,585·30	1,174,094
Chiba	1,943·85	1,273,387
Ibaraki . . .	2,235·67	1,131,556
Tochigi . . .	2,854·14	788,324
Gumma . . .	2,427·21	774,604
Nagano . . .	5,088·41	1,237,584
Yamanashi . . .	1,727·50	498,539
Shizuoka . . .	3,002·76	1,199,805
Aichi	1,864·17	1,591,357
Miye	2,196·56	495,389
Gifu	4,001·84	996,062
Shiga	1,540·30	712,024
Fukui	1,621·50	633,840
Ishikawa . . .	1,611·59	392,905
Toyama . . .	1,587·80	785,554

The above 17 prefectures form Central Japan.

Prefecture.	Area in square miles.	Population.
Niigata . . .	4,914·55	1,812,289
Fukushima . . .	5,042·57	1,057,971
Miyagi . . .	3,223·11	835,830
Yamagata . . .	3,576·89	829,210
Akita	4,493·84	775,077
Iwate	5,359·17	720,380
Awomori . . .	3,617·89	612,171

The above 7 prefectures form Northern Japan.

In the system of local administration full effect is given to the principle of popular representation. Each prefecture (urban or rural), each county, each town and each district (urban or rural) has its local assembly, the number of members being fixed in proportion to the population. There is no superior limit of number in the case of a prefectural assembly, but the inferior limit is 30. For a town assembly, however, the superior limit is 60 and the inferior 30; for a county assembly the corresponding figures are 40 and 15, and for a district assembly, 30 and 8. These bodies are all elective. The property qualification for the franchise in the case of prefectural and county assemblies is an annual payment of direct national taxes to the amount of 3 *yen;* and in the case of town and district assemblies, 2 *yen;* while to be eligible for election to a prefectural assembly a yearly payment of 10 *yen* of direct national taxes is necessary; to a county assembly, 5 *yen*, and to a town or district assembly, 2 *yen*. In towns and districts franchise-holders are further divided into classes with regard to their payment of local taxes. Thus, for town electors there are three classes, differentiated by the following process:—On the list of ratepayers the highest are checked off until their aggregate payments are equal to one-third of the total taxes. These persons form the first class. Next below them the persons whose aggregate payments represent the same fraction (⅓) of the total amount are checked off to form the second class, and all the remainder form the third class. Each class elects one-third of the members of assembly. In the districts there are only two classes, namely, those whose payments, in order from the highest, aggregate one-half of the total, the remaining names on the list being placed in the second class. Each class elects one-half of the members. This is called the system of *ô-jinushi* (large land-owners), and it is found to work satisfactorily as a device for conferring representative rights in proportion to property. The franchise is withheld from all local salaried officials, from judicial officials, from ministers of religion, from persons who, not being barristers by profession, assist the people in affairs connected with law courts or official bureaux, and from every individual or member of a company that contracts for the execution of public works or the supply of articles to a local administration, as well as from persons unable to write their own names and the name of the candidate for whom they vote. Members of assembly are not paid. For prefectural and county assemblies the term is four years; for town and district assemblies, six years, with the provision that one-half of the members must be elected every third year. The prefectural assemblies hold one session of 30 days yearly; the county assemblies, one session of not more than 14 days; the town and district assemblies have no fixed session: they are summoned by the mayor or the head-man (to whom further allusion will presently be made) when their deliberations appear necessary, and they continue in session till their business is concluded. Speaking broadly, the chief function of the assemblies is to deal with all questions of local finance. They discuss and vote the yearly budgets; they pass the settled accounts; they fix the local taxes within a maximum limit which bears a certain ratio to the national taxes; they make representations to the minister for home affairs; they deal with the fixed property of the locality; they raise loans, and so on. It is necessary, however, that they should obtain the consent of the minister for home affairs, and sometimes of the minister of finance also, before disturbing any objects of scientific, artistic, or historical importance; before contracting loans; before imposing special taxes, or passing the normal limits of taxation; before enacting new local regulations or changing the old; before dealing with grants in aid made by the central Treasury, &c. The governor of a prefecture, who is appointed by the central administration, is invested with considerable power. He oversees the carrying out of all works undertaken at the public expense; he causes bills to be drafted for discussion by an assembly; he is responsible for the administration of the funds and property of the prefecture; he orders payments and receipts; he directs the machinery for collecting taxes and fees; he summons a prefectural assembly, opens it and closes it, and has competence to suspend its session, should such a course seem necessary. Many of the functions performed by the governor with regard to prefectural assemblies are discharged by a "head-man" (*gun-chô*) in the case of county assemblies. This head-man is a salaried official appointed by the central administration. He convenes, opens, and closes the county assembly; he may require it to reconsider any of its financial decisions that seem improper, explaining his reasons for doing so, and should the assembly adhere to its original view, he may refer the matter to the governor of the prefecture. On the other hand, the assembly is competent to appeal to the home minister from the governor's decision. The county head-man may also take upon himself, in case of emergency, any of the functions falling within the competence of the county assembly, provided that he reports the fact to the assembly and seeks its sanction at the earliest possible opportunity. In each district also there is a head-man, but his post is always elective and generally non-salaried. He occupies towards a district assembly the same position that the county head-man holds towards a county assembly. Over the governors stands the minister for home affairs, who discharges general duties of superintendence and sanction, has competence to delete any item of a local budget, and may, with the Emperor's consent, order the dissolution of a local assembly, provided that steps are taken to elect and convene another within three months. The machinery of local administration is completed by councils, of which the governor of a prefecture, the mayor[1] of a town, or the head-man of a county or district, is *ex*

[1] The mayor of a town (*shichô*) is nominated by the minister for home affairs from among three men chosen by the town assembly.

officio president, and the councillors are partly elective, partly nominated by the central Government. The councils may be said to stand in an executive position towards the local legislatures, namely, the assemblies, for the former give effect to the measures voted by the latter, take their place in case of emergency, and consider questions submitted by them. This system of local government has now been in operation since 1885, and has been found to work well. It constitutes a thorough method of political education for the people, since the local assemblies —prefectural, county, town, and district—aggregate no fewer than 15,492 throughout the empire. In feudal days popular representation had no existence, of course, but a very effective chain of local responsibility was manufactured by dividing the people—apart from the *samurai*—into groups of five families, which were held jointly liable for any offence committed by one of their members. Thus it cannot be said that the people were altogether unprepared for this new system.

Law.—The laws of Japan are codified. They have all been drafted since the Restoration, their bases being the laws of Europe. In the work of drafting the Japanese received large assistance from foreign experts, and no efforts were spared to adopt the best principles of Occidental jurisprudence without doing violence to the customs and traditions of the nation. The civil code, the code of civil procedure, and the commercial code are modelled chiefly on the laws of Germany; the criminal code and the code of criminal procedure, on the laws of France. In one respect the code of criminal procedure has been allowed to fall behind the spirit of the age: preliminary examinations are private, and during them the accused is not allowed the benefit of counsel. Until a recent date persons under examination might be ordered into solitary confinement by the judge, if he considered that step necessary for eliciting the truth, but the *mise en sécret* was abolished in 1899, and a judge's power in preliminary examination is limited to separation of a prisoner's cell, and to forbidding intercourse between him and other persons.

The tribunals of justice are local courts, district courts, courts of appeal, and a supreme court, each having public procurators as well as judges attached to them. Local courts are presided over by a single judge, but all the other tribunals are collegiate, the district courts, appeal courts, and the supreme court being divided into several sections, each consisting of three, five, or seven judges respectively. Trial by jury has not been adopted in Japan, and is unlikely to be ever adopted. Neither is there any law of the nature of *habeas corpus*. The code of criminal procedure provides that a prisoner must be brought up for preliminary examination within forty-eight hours from the time of his apprehension, and empowers the examining judge to grant bail, the prisoner being entitled to complain to the court if bail is refused. There are also courts of conciliation, where cases are decided without being carried to contentious issues. There are 365 tribunals of justice in the empire, presided over by 1201 judges, with the assistance of 471 public procurators and 5987 clerks. It has been complained that the number of tribunals and their *personnel* are not sufficient to discharge the business coming before them. The criticism is probably just, but statistics show that the courts perform their functions rapidly, for in 1897 they dealt with 313,571 cases altogether, namely, 7654 appeals and 133,472 first instance cases in civil suits, 8507 questions of conciliation and 8723 appeals, and 155,215 first instance or magisterial cases in criminal matters.

In order to qualify for the post of judge or public procurator two examinations have to be passed. They are separated by an interval of at least two years, during which time the aspirant receives practical training in the duties of his profession. The Constitution provides that a judge's appointment shall be for life, and in practice he is not removed except by decision of the Disciplinary Court, or in consequence of a sentence for crime.

The number of police-offices in the empire (including Formosa) is 13,821, and the total number of police officials of all grades 32,910, or 1 for every 1421 of the population. The police force has been increased by 4591 since 1885, but of that increment the newly-organized force for Formosa represents 2934.

Crime.

The new criminal code came into operation in 1882, a reform which meant not only the complete abolition of torture, but also a sudden and striking change from laws of extreme severity to laws framed in accordance with the most humane principles of Western jurisprudence. An experiment so daring surprised foreign onlookers, and seemed to justify the apprehensions they freely expressed. But it does not appear from the records that by abandoning the system of heavy penalties encouragement was offered to crime. Taking the eight-years period from 1890 to 1897, by which time the police had learned to discharge their functions efficiently, and the compilation of statistics had become quite trustworthy, it is found that the number of persons charged with crimes or delicts in every thousand of the population stood at 3·21 in 1890, at 3·46 in 1891, at 3·71 in 1892, at 3·83 in 1893, at 3·88 in 1894, at 3·41 in 1895, at 3·40 in 1896, and at 3·32 in 1897. There is thus a tendency towards a decrease rather than an increase of crime, and the suitability of the new code to the conditions existing in Japan seems to have been clearly established. A similar tendency shows itself with regard to the inmates of houses of correction, the number having fallen from 1057 in 1890 to 692 in 1897. The effect of police vigilance, aided by improving conditions of life, is apparent also in checking incendiarism. This is a question of great importance for Japan, where, owing to the inflammable nature of the materials used in building habitations, danger of fire is always imminent. In the early part of the *Meiji* era fully 7 houses out of every 1000 in the country were destroyed yearly by conflagrations. In 1892 the number was 5·81, and in 1897 it had fallen to 4·20. More than 16 per cent. of these fires were due to incendiarism, but there has been a steady improvement in that respect, so that, whereas 2733 cases of arson occurred in 1892, the number in 1897 was only 1551.

Laws specially affecting Foreigners.—Under the revised treaties now in operation the following privileges are conceded to foreigners: (1) They may trade, travel, and reside in any part of Japan, enjoying full protection for their persons and property. (2) They may use the law courts on the same terms as Japanese subjects. (3) They have full religious freedom. (4) They are exempt from any taxes except those imposed on Japanese subjects. (5) They are exempt from military service, military contributions, and forced loans. (6) They may engage in all legitimate trades and mechanical operations, subject to the provisions of law. (7) They may enter into partnership with Japanese or foreigners, or become shareholders in joint-stock companies. (8) Their ships and cargoes may come to all ports open to foreign commerce without paying any higher duties or charges than those paid by Japanese subjects. (9) They are exempt from all transit dues, and they enjoy equality of treatment with Japan in regard to drawbacks, exportation, and warehousing facilities; but the coasting trade is reserved to Japanese vessels, except in the case of the existing open ports. (10) They may lease land. (11) They may take mortgages on land.

Foreigners are not at present permitted to own land in Japan in their individual capacity. The forms of tenure lawful for them are (1) tenure by ordinary lease; (2) tenure by superficies; and (3) tenure by ownership as a juridical person. Tenure by ordinary lease is limited to twenty years (subject to renewal), and the lessee is entitled to use and enjoy the object of the lease, whether land or buildings, under conditions substantially the same as those prescribed by English law, except that buildings, fixtures, trees, and plants placed there by the tenant may be removed by him at the termination of his lease. Tenure by "superficies"—a term which does not accurately represent its Japanese original, "superficial right"—is, in effect, a lease for purposes of building or planting. Such a lease may be for any term of years, fixed according to the convenience of the contracting parties, and the lessee (superficiary) is absolutely guaranteed against disturbance throughout that period—whether it be fifty or a thousand years. Even though the owner mortgages or sells the land before the expiration of the period, the rights of the superficiary are not affected, and the superficiary, on his side, may assign his superficies without prejudice to the rights of the owner. In short, this kind of tenure differs from actual ownership in name only. As to ownership by a juridical person, it is to be noted that the term "juridical person" signifies an association of two or more individuals of any nationality, or of mixed nationalities, formed for commercial, industrial, or certain other purposes, registered in Japan, and carrying on business according to the provisions of Japanese law. Such an association, in its corporate capacity, may own land. Thus two or three foreigners, contemplating the erection of a factory or mercantile premises in Japan, can become owners of land for that purpose, though as individuals they are not entitled to such a privilege.

A mortgagee does not become the owner of the mortgaged property by foreclosure, nor acquire any right of possession in it. When the debt is not discharged at the maturity of the mortgage, the property has to be sold by order of a court. There is also a special point with regard to the removal of mortgages. The purchaser of mortgaged property may offer a certain sum for the removal of the mortgage; and if the mortgagee, refusing the offer, demand a sale by auction, he must pledge himself to buy the property for a price at least 10 per cent. higher than the sum offered, in the event of that sum not being realized at the auction. Should the mortgagee be a foreigner, and the mortgaged property be land, then, since a foreigner cannot own land, the law provides that he must merely bind himself to be responsible for the difference between the amount bid at auction and a sum 10 per cent. higher than that offered originally for the removal of the mortgage. These various restrictions greatly impair the value of mortgages for business purposes. In the case of a pledge, also, Japanese law requires that the thing pledged must be actually delivered into the possession of the pledgee, except when it is in transit or stored in a public warehouse. The practice of hypothecating chattels by a registered bill of sale is not recognized.

Protection is given by Japanese law to foreign patents, designs, and trade-marks if proper steps are taken to register them. The applicant, if not domiciled in Japan, must appoint a representative domiciled there. The principles and rules governing the procedure in these matters are identical with those observed in Europe, and Japan is a member of the International Union for the Protection of Industrial Property.

The family law and the law of succession in Japan being based upon and adapted to the social conditions and customs long prevailing in the country, it has been considered wise by Japanese legislators that foreigners domiciled in Japan should be exempted from the operation of these laws, and left to be governed by the laws of their own nationalities, administered, of course, by Japanese tribunals.

Taxation.—The principal national taxes imposed in Japan are on land, incomes, business, vehicles, and *sake* (rice-beer). For purposes of taxation land is valued and a certain percentage of the assessed value is levied—5 per cent. in the case of urban lands, and 3⅓ per cent. in the case of rural lands. The assessment now adopted is generally the same as that made in 1873. Even at that time it did not amount to more than one-half of the market value of the land, and as the latter has largely appreciated, the tax actually paid is much below its nominal rate, especially in the cities, where the assessments are only a small fraction of the land's selling price. This tax is payable by the owner of the land. Income tax is payable, not only by Japanese subjects, but also by all persons having a domicile in Japan, or having resided there for more than one year. The minimum taxable income is 300 *yen* (£30) annually, and the rate for such an income is 1 per cent. As the income increases so does the rate, up to a limit of 5½ per cent., which is paid by persons having an income of 100,000 *yen* (£10,000) or upwards. The business tax is levied on various branches of business: as sales of merchandise, banking, insurance, warehousing, manufacturing, printing, photography, transportation, restaurants, hotels, factors and brokers. When levied on the amount of mercantile transactions, it is $\frac{1}{2000}$ for wholesale dealers and $\frac{3}{2000}$ for retail dealers. In other cases it is levied at the rate of $\frac{2}{1000}$ on the capital engaged, or at the rate of from 2 per cent. to 6 per cent. on the rental value of the buildings employed. When a business is carried on partly in a foreign country and partly in Japan, only the capital used in Japan is liable to tax. The taxes on vehicles and *sake* do not call for any special notice. Stamp duties and registration fees are also collected.

Local finances.

The total local expenditures are a little over 40 million *yen* annually. They increased from 25 millions to 40 millions in a period of 5 years (1895–99), but the increase is not an evidence of extravagance in administration, as 11 millions of it was devoted to useful public works, and nearly 2 millions to education. Revenue to meet these outlays is derived from five taxes—land-rate (13⅓ millions), house tax (5⅓ millions), business tax (2¾ millions), and miscellaneous tax (3½ millions). A large sum is obtained from property owned by the local administrations, and the central Treasury grants aids to the extent of 4½ million *yen*. The system of local taxation is complicated, but, speaking generally, two kinds of impost have to be paid: first, a prefectural tax; and, secondly, a town or district tax. Some of the local taxes are levied on the basis of the national tax—in which case the former must not exceed a certain fixed fraction of the latter; some are levied independently, as taxes on houses, vehicles, and draught-animals. A marked distinction is made between vehicles or animals kept for hire and those maintained by private individuals, and the same principle of graduation observed in the case of the income tax is applied to the house tax, so that the burden decreases rapidly as the poorer classes are reached.

Education.

Education is compulsory. Every child, on attaining the age of six, must attend a common elementary school, where, during a four years' course, instruction is given in morals, reading, writing, arithmetic, the rudiments of technical work, gymnastics, and poetry. Year by year the attendance at these schools increases. In 1898 4,062,418 children received education out of a total of

7,125,966, the percentage of school-goers being 68·91. The desire for instruction is keener among boys than among girls: of the former, 82·42 per cent. attend school, and of the latter only 53·73.

There are 26,322 public common elementary schools, and the total annual cost of maintaining them is £1,715,469. Hence the average yearly expense of each school is £65; the average number of students, 154; and the average annual cost per child, 8s. 6d., to which the child's parents contribute 1s. 9d. yearly, or $1\frac{3}{4}$d. per month. These elementary schools form part of the communal system, and such portion of their expenses as is not covered by tuition fees, income from school property, and miscellaneous sources, must be defrayed out of the proceeds of local taxation. The taxpayers' burden on this account is £1,150,446, and it thus appears that the four years' course of elementary education given to a Japanese child costs the taxpayer 22s. 6d., and costs the child's parents 7s The expense to parents will be still less in future, for by an ordinance issued in August 1900 it was enacted that whereas the payment of tuition fees has hitherto been the rule, and exemption from payment the exception, hereafter exemption is to be the rule and payment the exception. In short, elementary education will be virtually free.

There are also 174 public kindergartens, with an attendance of 15,000 infants, whose parents pay 3d. per month on the average for each child. In general the kindergartens are connected with elementary schools or with normal schools.

Many (4735) of the common elementary schools have a section where, subsequently to the completion of the regular curriculum, a special supplementary course of study may be pursued in agriculture, commerce, or industry (sewing in the case of girls). For the same purpose there exist also 318 higher elementary schools, to which a child can gain admittance after passing out of a common elementary school. The time devoted to these special courses is two, three, or four years, according to the degree of proficiency contemplated, and the cost to the parents is 6d. per month.

If a child, after graduating at a common elementary school, desires to extend its education, it passes into a common middle school, where training is given for practical pursuits or for admission to higher educational institutions. The ordinary curriculum at a common middle school includes moral philosophy, English language, history, geography, mathematics, natural history, natural philosophy, chemistry, drawing, and the Japanese language. Five years are required to graduate, and from the fourth year the student may take up a special technical course as well as the main course; or, in accordance with local requirements, technical subjects may be taught conjointly with the regular curriculum throughout the whole time. The law provides that there must be at least one common middle school in each prefecture. The actual number is 169, with 2061 teachers and 49,684 students, being an average of 294 students to each school, and 1 teacher to 24 students. The total annual cost of maintenance is £207,166. Thus each school requires an average outlay of £1226, of which sum the taxpayers defray £720. A student in a common middle school costs the State £2, 19s. yearly, and his five years' course represents a local tax of £14, 15s. It will be seen, therefore, that when a child has completed its four years in a common elementary school and five years in a common middle school, its education has cost the public £15, 17s. 6d.

Great inducements attract attendance at a common middle school. Not only does the graduation certificate carry considerable weight as a general qualification, but it also entitles a young man to volunteer for one year's service with the colours, thus escaping two of the three years he would have to serve as an ordinary conscript.

The graduate of a common middle school can claim admittance, without examination, to a high school, where he spends three years preparing to pass to a university, or four years studying a special subject, as law, engineering, or medicine. By following the course in a high school a youth obtains exemption from conscription until the age of 28, when one year as a volunteer will free him from all service with the colours. There are 6 high schools, with a total attendance of 4664 students, and the instructors number 351, or 1 to every 13 students. A high school certificate of graduation entitles its holder to enter a university without examination, and qualifies him for all public posts.

In addition to the schools already enumerated, which may be said to constitute the machinery of general education, there are special schools (6) and technical schools (74) where instruction is given in agriculture, commerce, mechanics, applied chemistry, navigation, electrical engineering, art (pictorial and applied), veterinary science, sericulture, and various other branches of industry. There are also 17 apprentices' schools, classed under the heading of "elementary," where courses of not less than six months, and not more than four years, may be taken in dyeing and weaving, embroidery, the making of artificial flowers, tobacco manufacture, sericulture, reeling silk, pottery, lacquer, wood-work, metal-work, or brewing. On the average, each of these schools has 67 students and 6 teachers, and costs £520 annually, or £7, 15s. per student. The taxpayers contribute £355 yearly towards the support of each school, and the expense to the student is about 2s. 6d. per month.

Normal schools are maintained for the purpose of training teachers. There are two high normal schools, one for males, the other for females, the former having 555 pupils, the latter 171; and there are 47 common normal schools, with 7302 male students and 879 females. Great difficulty is experienced in obtaining a full complement of teachers for elementary public schools. The total number required is 95,000 approximately, and the number actually available is only 64,000. That is mainly due to the very small emoluments given for such service. Out of 64,000 teachers now employed in elementary schools, only 50 get as much as £48 a year; 11,000 have less than £10 annually, and the salaries of 49,000 range from £11 to £24. Considering that a common labourer now earns £18 a year, the reason for the insufficiency of teachers is apparent.

There are two Imperial universities, one in Tôkyô and one in Kyôtô. The latter is not yet fully organized. The former has 205 professors and instructors and 2463 students. Its colleges number six — law, medicine, engineering, literature, science, and agriculture. It has a university hall where post-graduate courses are studied, and it publishes a quarterly journal giving accounts of scientific researches which indicate not only large erudition, but also original talent.

All the figures given above are independent of private educational institutions. Of these there are 1600, employing 5346 teachers and having 149,230 pupils. The tendency of the system pursued by the State is to discourage private education, for unless a private school brings its curriculum into accord with that prescribed for public institutions, its students are denied the valuable privilege of exemption from conscription, as well as the other advantages attaching to State recognition. Further, the disposition to

present large sums for educational purposes has not yet become widely effective among private individuals in Japan. Voluntary contributions in aid of public schools aggregate about £90,000 annually, but the efforts made by the people on this account are still comparatively insignificant.

The Anglo-Saxon element predominates largely among the foreigners engaged in education. Out of a total of 270 instructors, 198 are American and British. France comes third on the list with 42; Germany fourth with 16, and Russia fifth with 4.

II. Recent History.

The nation's part in the early changes.

When reference is made to the Japanese nation in connexion with the radical changes of 1867, it must be observed that only the nobles and the *samurai* (military class) are indicated—in other words, a section of the population representing about one-sixteenth of the whole. The bulk of the people—the agricultural, the industrial, and the mercantile classes—remained outside the sphere of politics, not sharing the anti-foreign prejudice, nor taking any serious interest in the great questions of the time. Foreigners often noted with surprise the contrast between the fierce antipathy displayed towards them by the *samurai* on the one hand, and the genial, hospitable reception given to them by the common people on the other. History teaches that the latter was the natural disposition of the Japanese—the former a mood educated by special experiences. Further, even the comparatively narrow statement that the restoration of the administrative power to the Emperor was the work of the nobles and the *samurai* must be taken with limitations. A majority of the nobles entertained no idea of any necessity for change. They were either held fast in the vice of Tokugawa authority, or paralysed by the sensuous seductions of the lives provided for them by the machinations of their retainers, who held the administrative authority of the fiefs in their own hands, leaving its shadow only to their lords. It was, in fact, among the retainers that longings for a new order of things were generated. Some of these men were sincere disciples of progress—a small band of students and deep thinkers who, looking through the narrow Dutch window at Deshima, had caught a glimmering perception of the realities that lay beyond the horizon of their country's prejudices. But the influence of such Liberals was comparatively insignificant. Though they showed remarkable moral courage and tenacity of purpose, the age did not furnish any strong object-lessons to enforce their propaganda of progress. The factor chiefly making for change was the *samurai's* loyal instinct, reinforced by the teachings of Chinese philosophy, by the revival of the Shinto cult, by the promptings of national enterprise, and by the suggestions of foreign intercourse.

Throughout the whole period of Tokugawa rule there had been a strong, if somewhat fitful, leaning of the national mind towards the political philosophy of Confucius and Mencius, as expounded by Choo He and Yang Wang-ming. Iyeyasu himself had given the first impetus to this disposition by his patronage of literature. Without any perception of the true spirit of the Chinese sages' teachings, he ordered that primers of the "old learning" should be procured and studied. Thus the Zen doctrines of Buddhism, which contributed so much to the development of the heroic and the sentimental, and were therefore favourable to the stability of military feudalism, gradually gave place to a theory that the only legitimate ruler was heaven-appointed, that the good of the people should be the first object of administration, and that to fail in achieving that object was to forfeit the title of administrator. A century later, another Tokugawa Shogun (Tsunayoshi) fostered a movement equally fatal to the permanency of feudalism; he encouraged the revival of the Shinto cult which teaches the divine origin of the Mikado, and constructively inculcates that every exercise of administrative authority by a subject is a usurpation. It is possible that although the current of thought inspired by the Chinese philosophy and the Japanese cult was opposed to the dual government of Yedo and Kyôtô, the system might have long survived this theoretical disapproval had nothing occurred to furnish signal proof of its practical defects. But the crisis caused by the advent of foreign ships, and by the forceful renewal of foreign intercourse, afforded a convincing proof of the Shogunate's incapacity to protect the State's supposed interests and to enforce the traditional policy of isolation which had come to be considered essential to the empire's integrity and to the sanctity of the throne. Thus it may be alleged that the nation's mind was already educated for the change which the advent of foreigners precipitated.

Character of the revolution.

But though essentially imperialistic in its prime purposes, the revolution which involved the fall of the Shogunate, and ultimately of feudalism, may be called democratic with regard to the *personnel* of those who planned and directed it. They were, for the most part, *samurai*, without either official rank or social standing. That is a point essential to a clear understanding of the issue. Fifty-five men may be said to have planned and carried out the overthrow of the Yedo administration, and only five of them were territorial nobles. Eight, belonging to the Court nobility, laboured under the traditional disadvantage of their class, poverty; and the remaining forty-two, the hearts and hands of the movement, may be described as ambitious youths, who sought to make a career for themselves in the first place, and for their country in the second. The average age of the whole did not exceed thirty. There was another element also—an element for which any student of Japanese history might have been prepared: the Satsuma *samurai* aimed not merely at overthrowing the Tokugawa, but also at obtaining the Shogunate for their own chief. Possibly it would be unjust to say that all the leaders of the great southern clan harboured that idea. But some of them certainly did, and not until they had consented to abandon the project did their union with Choshiu, the other great southern clan, become possible—a union without which the revolution could scarcely have been accomplished. This ambition of the Satsuma clansmen deserves special mention, because it bore remarkable fruit; it may be said to have laid the foundation of constitutional government in Japan. For, in consequence of the distrust engendered by such aspirations, the authors of the Restoration agreed that when the Emperor assumed the reins of power, he should pledge himself by oath to convene a deliberative assembly, and to appoint to administrative posts men of intellect and erudition wherever they might be found.

The anti-feudal idea.

At the outset the necessity of abolishing feudalism did not present itself clearly to the leaders of the revolution. Their sole idea was the unification of the nation. But when they came to consider closely the practical side of the problem, they understood how far it would lead them. Evidently that one homogeneous system of law should replace the more or less heterogeneous systems operative in the various fiefs was essential, and such a substitution meant that the feudatories must be deprived of their local autonomy and, incidentally, of their control of local finances. That was a stupendous change. Hitherto each feudal chief had collected the revenues of his fief and had employed them at will, subject

to the sole condition of maintaining a body of troops proportionate to his income. He had been, and was still, an autocrat within the limits of his territory. On the other hand, the active authors of the revolution were a small band of men mainly without prestige or territorial influence. It was impossible that they should dictate any measure sensibly impairing the local and fiscal autonomy of the feudatories. No power capable of enforcing such a measure existed at the time. All the great political changes in Japan had been preceded hitherto by wars culminating in the accession of some strong clan to supreme authority, whereas in this case there had been a displacement without a substitution—the Tokugawa had been overthrown and no new administrators had been set up in their stead. It was, moreover, certain that an attempt on the part of any one clan to constitute itself executor of the Sovereign's mandates would have stirred the other clans to vehement resistance. In short, the leaders of the revolution found themselves pledged to a new theory of government without any machinery for carrying it into effect, or any means of abolishing the old practice. An ingenious exit from this curious dilemma was devised by the young reformers. They induced the feudal chiefs of Satsuma, Choshiu, Tosa, and Hizen, the four most powerful clans in the south, publicly to surrender their fiefs to the Emperor, praying his Majesty to reorganize them and to bring them all under the same system of law. In the case of Shimazu, chief of Satsuma, and Yodo, chief of Tosa, this act must stand to their credit as a noble sacrifice. To them the exercise of power had been a reality, and the effort of surrendering it must have been correspondingly costly. But the chiefs of Choshiu and Hizen obeyed the suggestions of their principal vassals with little, if any, sense of the probable cost of obedience. The same remark applies to all the other feudatories, with exceptions so rare as to emphasize the rule. They had long been accustomed to abandon the management of their affairs to their leading clansmen, and they allowed themselves to follow the same guidance at this crisis. Out of the whole 276 feudatories, only 17 hesitated to imitate the example of the four southern fiefs.

Motives of the reformers.

An explanation of this remarkable incident has been sought by supposing that the *samurai* of the various clans, when they advised a course so inconsistent with fidelity to the interests of their feudal chiefs, were influenced by motives of personal ambition, imagining that they themselves might find great opportunities under the new régime. Some hope of that kind may fairly be assumed, and was certainly realized, in the case of the leading *samurai* of the four southern clans which headed the movement. But it is plain that no such expectations can have been generally entertained. The simplest explanation seems to be the true one: a certain course, indicated by the action of the four southern clans, was conceived to be in accord with the spirit of the Restoration, and not to adopt it would have been to shrink publicly from a sacrifice dictated by the principle of loyalty to the throne—a principle which had acquired supreme sanctity in the eyes of the men of that era. There might have been some uncertainty about the initial step; but so soon as that was taken by the southern clans their example acquired compelling force. History shows that in political crises the Japanese *samurai* is generally ready to pay deference to certain canons of almost romantic morality. There was a fever of loyalty and of patriotism in the air of the year 1869. Any one hesitating, for obviously selfish reasons, to adopt a precedent such as that offered by the procedure of the great southern clans, would have seemed to forfeit the right of calling himself a *samurai*.

But although the leaders of this remarkable movement now understood that they must contrive the total abolition of feudalism and build up a new administrative edifice on foundations of constitutional monarchy, they appreciated the necessity of advancing slowly towards a goal which still lay beyond the range of their followers' vision. Thus the first steps taken after the surrender of the fiefs were to appoint the feudatories to the position of governors in the districts over which they had previously ruled; to confirm the *samurai* in the possession of their incomes and official positions; to put an end to the distinction between Court nobles and territorial nobles, and to organize in Kyôtô a cabinet consisting of the leaders of the Restoration. Each new governor received one-tenth of the income of the fief by way of emoluments; the pay of the officials and the *samurai*, as well as the administrative expenses of the district, was defrayed from the same source, and the residue, if any, was to be passed into the treasury of the central Government.

Defects of the first measures.

The defects of this system from a monarchical point of view soon became evident. It did not give the power of either the purse or the sword to the Sovereign. The revenues of the administrative districts continued to be collected and disbursed by the former feudatories, who also retained the control of the troops, the right of appointing and dismissing officials, and almost complete local autonomy. A further radical step had to be taken, and the leaders of reform, seeing nothing better than to continue the method of procedure which had thus far proved so successful, contrived, first, that several of the administrative districts should send in petitions seeking to surrender their local autonomy, and be brought under the direct rule of the central Government; secondly, that a number of *samurai* should apply for permission to lay aside their swords and become farmers. The growth of the *samurai* class and their differentiation from the agriculturists to whom they originally belonged had been an essential feature of the feudal system. It was thought necessary that reversion to the original state of affairs in these respects should accompany the fall of feudalism. While the nation was digesting the principles embodied in these petitions, the Government made preparations for further measures of reform. The ex-chief of Satsuma, who showed some umbrage because the services of his clan in promoting the Restoration had not been more fully recognized, was induced to take high ministerial office, as were also the ex-chiefs of Choshiu and Tosa. Each of the four great clans had now three representatives in the ministry. These clans were further persuaded to send to Tôkyô—whither the Emperor had moved his court—contingents of troops to form the nucleus of a national army. Importance attaches to these details because the principle of clan representation, illustrated in the organization of the cabinet of 1871, continued to be approximately observed for many years in forming ministries, and ultimately became a target for the attacks of party politicians.

Adoption of radical measures.

On the 29th of August 1871 an Imperial decree announced the abolition of the system of local autonomy, and the removal of the territorial nobles from the posts of governors. The taxes of the former fiefs were to be paid thenceforth into the central treasury; all officials were to be appointed by the Imperial Government, and the feudatories, retaining permanently an income of one-tenth of their original revenues, were to make Tôkyô their place of residence. As for the *samurai*, they remained for the moment in possession of their hereditary pensions. Radical as these changes seem, the disturbance caused by them was not great, since they left the incomes of the military class untouched. Some of the

incomes were for life only, but the majority were hereditary, and all had been granted in consideration of their holders devoting themselves to military service. Four hundred thousand men approximately were in receipt of such emoluments, and the total amount annually taken from the taxpayers for this purpose was about two million pounds sterling. Plainly the nation would have to be relieved of this burden sooner or later. The *samurai* were essentially an element of the feudal system, and that they should survive the latter's fall would have been incongruous. On the other hand, suddenly and wholly to deprive these men and their families—a total of some two million persons—of the means of subsistence on which they had hitherto relied with absolute confidence, and in return for which they and their forefathers had rendered faithful service, would have been an act of shocking inhumanity. It may easily be conceived that this problem caused extreme perplexity to the administrators of the new Japan. They left it unsolved for the moment, trusting that time and the loyalty of the *samurai* themselves would suggest some solution.

As for the feudal chiefs, who had now been deprived of all official status and reduced to the position of private gentlemen, without even a patent of nobility to distinguish them from ordinary individuals, they did not find anything specially irksome or regrettable in their altered position. No scrutiny had been made into the contents of their treasuries. They were allowed to retain unquestioned possession of all the accumulated funds of their former fiefs, and they also became public creditors for annual allowances equal to one-tenth of their feudal revenues. They had never previously been so pleasantly circumstanced. It is true that they were entirely stripped of all administrative and military authority; but since their possession of such authority had been in most cases merely nominal, they did not feel the change except as a relief from responsibility.

Treatment of the samurai.

By degrees public opinion began to declare itself with regard to the *samurai*. If they were to be absorbed into the bulk of the people and to lose their fixed revenues, some capital must be placed at their disposal to begin the world again. The *samurai* themselves showed a noble faculty of resignation. They had been a privileged class, but they had purchased their privileges with their blood and by serving as patterns of all the qualities most prized among Japanese national characteristics. The record of their acts and the recognition of the people entitled them to look for munificent treatment at the hands of the Government which they had been the means of setting up. Yet none of these considerations blinded them to the painful fact that the time had passed them by—that no place existed for them in the new polity. Many of them voluntarily stepped down into the company of the peasant or the tradesman, and many others signified their willingness to join the ranks of common bread-winners if some aid were given to equip them for such a career. After two years' consideration the Government took action. A decree announced, in 1873, that the Treasury was prepared to commute the pensions of the *samurai* at the rate of six years' purchase for hereditary pensions and four years for life pensions—one-half of the commutation to be paid in cash, and one-half in bonds bearing interest at the rate of 8 per cent. Reducing this to arithmetic, it will be seen that a perpetual pension of £10 would be exchanged for a payment of £30 in cash, together with securities giving an income of £2, 8s.; and that a £10 life pensioner received £20 in cash and securities yielding £1, 12s. annually. It is scarcely credible that the *samurai* should have accepted such an arrangement. Something, perhaps, must be ascribed to their want of business knowledge, but the general explanation is that they made a large sacrifice in the interests of their country. Nothing in all their career as soldiers became them better than their manner of abandoning it. They were told that they might lay aside their swords, and many of them did so, though from time immemorial they had cherished the sword as the mark of a gentleman, the most precious possession of a warrior, and the one outward evidence that distinguished men of their order from common toilers after gain. They saw themselves deprived of their military employment, were invited to surrender more than one-half of the income it brought, and knew that they were unprepared alike by education and by tradition to earn bread in any calling save that of arms. Yet, at the invitation of a Government which they had helped to establish, many of them bowed their heads quietly to this sharp reverse of fortune. It was certainly a striking instance of the fortitude and resignation which the creed of the *samurai* required him to display in the presence of adversity. It is to be noted, however, that as yet the Government's measures with regard to the *samurai* were not compulsory. Men laid aside their swords and commuted their pensions at their own option.

Meanwhile differences of opinion began to develop among the leaders of progress themselves. Coalitions formed for destructive purposes are often found unable to endure the strain of constructive efforts. Such lack of cohesion might easily have been foreseen in the case of the Japanese reformers. Young men without experience of public affairs, or special education to fit them for responsible posts, found the duty suddenly devolved on them not only of devising administrative and fiscal systems universally applicable to a nation hitherto divided into a congeries of semi-independent principalities, but also of shaping the country's demeanour towards novel problems of foreign intercourse and alien civilization. So long as the heat of their assault upon the Shogunate fused them into a homogeneous party they worked together successfully. But when they had to build a brand-new edifice on the ruins of a still vivid past, it was inevitable that their opinions should vary as to the nature of the materials to be employed. In this divergence of views many of the capital incidents of Japan's modern history had their origin. It has been stated already that the declaration which the young Emperor was invited to make on assuming the reins of government included a promise constructively pointing to a representative polity, and that the promise was suggested by mutual jealousy of the planners of the Restoration rather than by any sincere desire for parliamentary institutions. Some zealous reformers certainly wished to follow, in this respect, the example of the foremost Occidental nations; but a great majority of the statesmen of the time thought only of a system which, by endowing all the clans with a share of administrative authority, would prevent the undue preponderance of any one of them. It need scarcely be repeated that the military class alone entered into this account. A "national assembly" was regarded solely as an instrument for eliciting the views of the *samurai*. Two such assemblies actually met in the years immediately following the Restoration. But they were nothing more than debating clubs. No legislative power was entrusted to them, and their opinions received little official attention. After the second fiasco they were tacitly allowed to pass out of existence. Everything, indeed, goes to show that representative government might have long remained outside the range of practical politics had not its uses derived vicarious value from special complications.

First essays in representative government.

Chief among those complications was the Korean question. The story of Japan's relations with Korea, though dating from very remote times and including several memorable incidents, may be epitomized here into the statement that from the 16th century, when the peninsula was over-run by Japanese troops, its rulers made a habit of sending a present-bearing embassy to facilitate the accession of each Japanese Shogun. But after the fall of the Tokugawa Shogunate the Korean court desisted from this custom, declared its determination to have no further relations with a country embracing Western civilization, and refused even to receive a Japanese embassy. Naturally such conduct roused deep umbrage in Japan. Already much friction had been developed among the leaders of national reform. Of the fifty-five men whose united efforts had compassed the fall of the Shogunate, five stood conspicuous above their colleagues. They were Iwakura and Sanjo, Court nobles; Saigo and Okubo, *samurai* of Satsuma, and Kido, a *samurai* of Choshiu. In the second rank came many men of great gifts, whose youth alone disqualified them for prominence—Ito, the constructive statesman of the *Meiji* era, who inspired nearly all the important measures of the time, though he did not openly figure as their originator; Inouye, who never lacked a resource or swerved from the dictates of loyalty; Okuma, a politician of subtle, versatile, and vigorous intellect; Itagaki, the Rousseau of his era, and a score of others created by the extraordinary circumstances with which they had to deal. But the five first mentioned were the captains, the rest only lieutenants. Among the five, four were sincere reformers—not free, of course, from selfish motives, but truthfully bent upon promoting the interests of their country before all other aims. The fifth, Saigo Takamori, was a man in whom boundless ambition lay concealed under qualities of the noblest and most enduring type. His absolute freedom from every trace of sordidness gave currency to a belief that his aims were of the simplest; the story of his career satisfied the highest canons of the *samurai*; his massive physique, commanding presence, and sunny aspect impressed and attracted even those who had no opportunity of admiring his life of self-sacrificing effort or appreciating the remarkable military talent he possessed. In the first part of his career, the object of his ambition was Satsuma; in the latter part, Saigo. The overthrow of the Tokugawa Shogunate presented itself to him originally as a prelude to the supremacy of the Satsuma clan, and when the abolition of feudalism defeated that purpose, Satsuma assumed in his eyes the guise of Saigo. Whether he clearly recognized his own project or was unconsciously swayed by it, there is no doubt that he looked to become supreme in the administration of State affairs. To that end the preservation of the military class was essential. By the swords of the *samurai* alone could a new *imperium in imperio* be carved out. On the other hand, Saigo's colleagues in the ministry saw clearly not only that the *samurai* were an unwarrantable burden on the nation, but also that their continued existence after the fall of feudalism would be a menace to public peace as well as an anomaly. Therefore they took the steps already described, and followed them by the enaction of a conscription law, making every adult male liable for military service without regard to his social standing. It is easy to conceive how painfully unwelcome this conscription law proved to the *samurai*. Many of them were not unwilling to commute their pensions, since their creed had always forbidden them to care for money. Many of them were not unwilling to abandon the habit of carrying swords, since the adoption of foreign costume rendered such a custom incongruous and inconvenient. But very few of them could readily consent to step down from their cherished position as the military class, and relinquish their traditional title to bear the whole responsibility and enjoy the whole honour of fighting their country's battles. They had supposed, not unreasonably, that service in the army and navy would be reserved exclusively for them and their sons, whereas now the commonest rustic, mechanic, or tradesman would be equally eligible.

The Korean question, and its effects.

While the pain of this blow was still fresh the question of Korea's contumacious conduct presented itself. It produced an immediate and violent disruption in the ranks of the little band of reformers. Saigo saw in a foreign war the sole remaining chance of achieving his ambition by lawful means. The Government's conscription scheme, yet in its infancy, had not produced even the skeleton of an army. If Korea had to be conquered, the *samurai* must be employed; and their employment would mean, if not their rehabilitation, at least their organization into a force which, under Saigo's leadership, might dictate a new polity. Other members of the cabinet believed that the nation would be disgraced if it tamely endured Korea's insults. Thus several influential voices swelled the clamour for war. But a peace party offered strenuous opposition. Its members saw the collateral issues of the problem, and declared that the country must not think of taking up arms during a period of radical transition. The final discussion took place in the Emperor's presence. Probably none of those engaged in it understood the whole scope of its national significance, or perceived that they were debating, not merely whether there should be peace or war, but whether the country should halt or advance on its newly-adopted path of progress. The peace party prevailed, and four members of the cabinet, including Saigo, resigned. This rupture was destined to have far-reaching consequences. One of the seceders immediately raised the standard of revolt. Among the devices employed by him to win adherents was an attempt to fan into flame the dying embers of the anti-foreign sentiment. The Government crushed the insurrection easily. Another seceder was Itagaki Taisuke. He believed in representative institutions, and advocated the establishment of a national assembly consisting half of officials and half of popular nominees. His views, premature and visionary, obtained no currency at the moment, but in later years became the shibboleth of a great political party.

Split among the reformers.

Saigo, the most prominent of the seceders, seems to have concluded from that moment that he must abandon his aims or achieve them by force. He retired to his native province of Satsuma, and applied his whole resources, his great reputation, and the devoted loyalty of a number of able followers to organizing and equipping a strong body of *samurai*. Matters were facilitated for him by the conservatism of the celebrated Shimazu Saburo, former chief of Satsuma, who, though not opposed to foreign intercourse, had been revolted by the wholesale iconoclasm of the time, and by the indiscriminate rejection of Japanese customs in favour of foreign. He protested vehemently against what seemed to him a slavish abandonment of the nation's individuality, and finding his protest fruitless, he set himself to preserve in his own distant province, where the writ of the Yedo Government had never run, the fashions, institutions, and customs which his former colleagues in the administration were ruthlessly rejecting. Satsuma thus became a centre of conservative influences, among which Saigo and his constantly augmenting band of *samurai* found a congenial environment. During four years this breach between the central Government and the southern clan grew constantly

wider. The former steadily organized its conscripts, trained them in foreign tactics, and equipped them wholly with foreign arms. The latter adopted the rifle and the drill of Europe, but clung to the sword of the *samurai*, and engaged ceaselessly in exercises for developing physical power.

Expedition to Formosa.

Many things happened in that four-years interval; among them a military expedition to Formosa, which led Japan to the verge of war with China. The ostensible cause of this complication was the barbarous treatment of castaways from Riukiu by Formosan aborigines. Upon the Chinese Government properly devolved the duty of punishing its subjects, the Formosans. But as the Chinese Government showed no inclination to discharge the duty, Japan took the law into her own hands. She would never have done so, however, had she not hoped to placate thereby the Satsuma *samurai*. The Riukiu islands had been for centuries an appanage of the Satsuma fief, and the Government, in undertaking to protect the islanders, not only showed consideration for the discontented clan, but also acceded to the *samurai's* wish for an over-sea campaign. From a military point of view the expedition was successful. But little glory was to be gained by shooting down the semi-savage inhabitants of Formosa, and whatever potentialities the expedition might have possessed with regard to domestic politics were marred by the bad grace shown in carrying it out and by the feebleness of its international issue. For the Tôkyô Government, by seeking at the eleventh hour to stay the departure of the ships, seemed to dissociate itself from the enterprise, and by subsequently sending an ambassador to Peking with instructions to contrive a peaceful solution, lost credit with the *samurai* whom it had hoped to gratify.

Treaty with Korea.

A year after the return of the Formosa expedition, that is to say, at the close of 1875, the Koreans completed their rupture with Japan by firing on the boats of a Japanese war-vessel engaged in the peaceful operation of coast-surveying. No choice now remained except to despatch an armed expedition against the truculent kingdom. In this matter Japan showed herself an apt pupil of Occidental methods such as had been practised against herself in former years. She assembled an imposing force of warships and transports, but instead of proceeding to extremities, she employed the squadron—which was by no means so strong as it seemed—to intimidate Korea into signing a treaty of amity and commerce, and opening three ports to foreign trade. That was the beginning of Korea's friendly relations with the outer world, and Japan naturally took credit for the fact that, thus early in her new career, she had become an instrument for extending the principle of universal intercourse opposed so strenuously by herself in the past. But the incident only accentuated the dissatisfaction of the conservative *samurai*. They did not want treaties of commerce, and they held it a national humiliation that the country should have negotiated on equal terms with a little state which they regarded as a tributary, and which acknowledged China as its suzerain.

Final abolition of sword-wearing and pensions.

Two extreme measures were now (1876) adopted by the Government: a veto against the wearing of swords, and an edict ordering the compulsory commutation of the pensions and allowances received by the nobles and the *samurai*. Three years previously the wearing of swords had been declared optional, and a scheme of voluntary commutation had been announced. Many had bowed quietly to the spirit of these enactments. But many still retained their swords and drew their pensions as of old, obstructing, in the former respect, the Government's projects for the re-organization of society, and imposing, in the latter, an intolerable burden on the resources of the Treasury. The Government thought that the time had come, and that its own strength sufficed, to substitute compulsion for persuasion. The financial measure—which was contrived so as to affect the smallest pension-holders least injuriously—evoked no complaint. The *samurai* remained faithful to the creed which forbade them to be concerned about money. But the veto against sword-wearing overtaxed the patience of the extreme conservatives. It seemed to them that all the most honoured traditions of their country were being ruthlessly sacrificed on the altar of alien innovations. Armed protests ensued. A few scores of *samurai*, equipping themselves with the hauberks and weapons of old times, fell upon the garrison of a castle, killed or wounded some 300, and then, retiring to an adjacent mountain, died by their own hands. Their example found imitators in two other places, and finally the Satsuma *samurai* rose in arms under Saigo.

Satsuma insurrection.

This was an insurrection very different in dimensions and motives from the paltry outbreaks that had preceded it. During four years the preparations of the Satsuma men had been unremitting. They were equipped with rifles and cannon; they numbered some 30,000, being thus nearly as numerous as the Government's standing army; they were all of the military class, and in addition to high training in Western tactics and in the use of modern arms of precision, they knew how to wield that formidable weapon, the Japanese sword, of which their opponents were for the most part ignorant. Ostensibly their object was to restore the *samurai* to their old supremacy, and to secure for them all the posts in the army, the navy, and the administration. But although they doubtless entertained that intention, it was put forward mainly with the hope of winning the co-operation of the military class in all parts of the empire. The real purpose of the revolt was to secure the governing power for Satsuma. A bitter struggle ensued. Beginning on 29th January 1877, it was brought to a close on 24th September of the same year by the death, voluntary or in battle, of all the rebel leaders. During that period the number of men engaged on the Government's side had been 66,000, and the number on the side of the rebels 40,000, out of which total the killed and wounded aggregated 35,000, or 33 per cent. of the whole. Had the Government's troops been finally defeated, there can be no doubt that the *samurai's* exclusive title to man and direct the army and navy would have been re-established, and Japan would have found herself permanently saddled with a military class, heavily burdening her finances, seriously impeding her progress towards constitutional government, and perpetuating all the abuses incidental to a policy in which the power of the sword rests entirely in the hands of one section of the people. The nation scarcely appreciated the great issues that were at stake. It found more interest in the struggle as furnishing a conclusive test of the efficiency of the new military system compared with the old. The army sent to quell the insurrection consisted of recruits drawn indiscriminately from every class of the people. Viewed in the light of history, it was an army of commoners, deficient in the fighting instinct, and traditionally demoralized for all purposes of resistance to the military class. The Satsuma insurgents, on the contrary, represented the flower of the *samurai*, long trained for this very struggle, and led by men whom the nation regarded as its bravest captains. The result dispelled all doubts about the fighting quality of the people at large.

Concurrently with these events the Government diligently endeavoured to equip the country with all the paraphernalia of Occidental civilization. It is easy to understand that the master-minds of the era, who had planned and carried

out the Restoration, continued to take the lead in all paths of progress. Their intellectual superiority entitled them to act as guides; they had enjoyed exceptional opportunities of acquiring enlightenment by visits to Europe and America, and the Japanese people had not yet lost the habit of looking to officialdom for every initiative. But the spectacle thus presented to foreign onlookers was not altogether without disquieting suggestions. The Government's reforms seemed to outstrip the nation's readiness for them, and the results wore an air of some artificiality and confusion. Englishmen were employed to superintend the building of railways, the erection of telegraphs, the construction of lighthouses, and the organization of a navy. To Frenchmen was entrusted the work of re-casting the laws and training the army in strategy and tactics. Educational affairs, the organization of a postal service, the improvement of agriculture and the work of colonization were supervised by Americans. The teaching of medical science, the compilation of a commercial code, the elaboration of a system of local government, and ultimately the training of military officers were assigned to Germans. For instruction in sculpture and painting Italians were engaged. Was it possible that so many novelties should be successfully assimilated, or that the nation should adapt itself to systems planned by a motley band of aliens who knew nothing of its character and customs? These questions did not trouble the Japanese nearly so much as they troubled strangers. The truth is that conservatism was not really required to make the great sacrifices suggested by appearances. Among all the innovations of the era the only one that a Japanese could not lay aside at will was the new fashion of dressing his hair. He abandoned the queue irrevocably. But for the rest he lived a dual life. During hours of duty he wore a fine uniform, shaped and decorated in foreign style. But so soon as he stepped out of office or off parade, he reverted to his own comfortable and picturesque costume. Handsome houses were built and furnished according to Western models. But each had an annex where alcoves, verandahs, matted floors and paper sliding doors continued to do traditional duty. Beefsteaks, beer, "grape-wine," knives and forks came into use on occasion. But rice-bowls and chop-sticks held their everyday place as of old. In a word, though the Japanese adopted every convenient and serviceable attribute of foreign civilization, such as railways, steamships, telegraphs, post-offices, banks, and machinery of all kinds; though they accepted Occidental sciences and, to a large extent, Occidental philosophies; though they recognized the superiority of European jurisprudence and set themselves to bring their laws into accord with it, they nevertheless preserved the essentials of their own mode of life and never lost their individuality. A remarkable spirit of liberalism and a fine eclectic instinct were needed for the part they acted, but they did no radical violence to their own traditions, creeds, and conventions. There was indeed a certain element of incongruity and even grotesqueness in the nation's doings. Old people cannot fit their feet to new grooves without some clumsiness. The Japanese had grown very old in their special paths, and their novel departure was occasionally disfigured by solecisms. The refined taste that guided them unerringly in all the affairs of life as they had been accustomed to live it, seemed to fail them signally when they emerged into an alien atmosphere. They have given their proofs, however. It is now seen that the apparently excessive rapidity of their progress did not overtax their capacities; that they have emerged safely from their destructive era and carried their constructive career within reach of certain success, and that while they have still to develop some of the traits of their new civilization, there is no prospect whatever of its proving ultimately unsuited to them.

Steps of progress.

After the Satsuma rebellion, nothing disturbed the even tenor of Japan's domestic politics except an attempt on the part of some of her people to force the growth of parliamentary government. No one reading Japanese history carefully can fail to infer that representative institutions are in the genius of the nation. From an early era the Sovereign ceased to be autocratic. All the highest offices of state became hereditary possessions of certain great families, and as generation followed generation, each unit of this oligarchy of households attained the dimensions of a clan. By and by the exigencies of the time gave birth to a military aristocracy, headed by a generalissimo (Shogun), into whose hands the administrative authority passed. But even in this military feudalism no traces of genuine autocracy were found. Just as the extensive powers nominally vested in the central figure, the Shogun, were in reality wielded by a large body of ministers and councillors, so the local autonomy enjoyed by each fief was exercised, not by the chief himself, but by his leading vassals. A united effort on the part of all the clans to overthrow this system and wrest the administrative power from the Shogun could have only one logical outcome, the combined exercise of the recovered power by those who had been instrumental in recovering it. That was the meaning of the oath taken by the Emperor at the Restoration, when the youthful sovereign was made to say that "wise counsels should be sought, and all things determined by public discussion." But the framers of the oath had the *samurai* alone in view. Into their consideration the "common people"—farmers, mechanics, tradesmen—did not enter at all, nor had the common people themselves any idea of advancing a claim to be considered. A voice in the administration would have been to them an embarrassing rather than a pleasing privilege. Thus, as already related, the first deliberative assembly was composed of nobles and *samurai* only. A mere debating club without any legislative authority, it was permanently dissolved after two sessions. Possibly the problem of a parliament might have been long postponed after that fiasco, had it not found an ardent advocate in Itagaki Taisuke (afterwards Count Itagaki). A Tosa *samurai*, conspicuous as a leader of the Restoration movement, Itagaki was among the advocates of recourse to strong measures against Korea in 1873, and his failure to carry his point, supplemented by a belief that a large section of public opinion would have supported him had there been any machinery for appealing to it, gave fresh impetus to his faith in constitutional government. Leaving the cabinet on account of the Korean question, he became the nucleus of agitation in favour of a parliamentary system, and under his banner were enrolled not only discontented *samurai*, but also many of the young men who, returning from direct observation of the working of constitutional systems in Europe or America, and failing to obtain official posts in Japan, attributed their failure to the oligarchical form of their country's polity. Thus in the interval between 1873 and 1877 there were two centres of disturbance in Japan: one in Satsuma, where Saigo figured as leader; the other in Tosa, under Itagaki's guidance. When the Satsuma men appealed to arms in 1877, a widespread apprehension prevailed lest the Tosa politicians should throw in their lot with the insurgents. Such a fear had its origin in failure to understand the object of the one side or to appreciate the sincerity of the other. Saigo and his adherents fought to substitute a Satsuma clique for the oligarchy already in power. Itagaki and his followers

Development of representative government.

struggled for constitutional institutions. The two could not have anything in common. There was consequently no coalition. But the Tosa agitators did not neglect to make capital out of the embarrassment caused by the Satsuma rebellion. While the struggle was at its height, they addressed to the Government a memorial, charging the administration with oppressive measures to restrain the voice of public opinion, with usurpation of power to the exclusion of the nation at large, and with levelling downwards instead of upwards, since the *samurai* had been reduced to the rank of commoners, whereas the commoners should have been educated to the standard of the *samurai*. This memorial asked for a representative assembly and talked of popular rights. But since the document admitted that the people were uneducated, it is plain that there cannot have been any serious idea of giving them a share in the administration. In fact, the Tosa Liberals were not really contending for popular representation in the full sense of the term. What they wanted was the creation of some machinery for securing to the *samurai* at large a voice in the management of State affairs. They chafed against the fact that whereas the efforts and sacrifices demanded by the Restoration had fallen equally on the whole military class, the official prizes under the new system were monopolized by a small coterie of men belonging to the four principal clans. It is on record that Itagaki would have been content originally with an assembly consisting half of officials, half of non-official *samurai*, and not including any popular element whatever.

But the Government did not believe that the time had come even for a measure such as the Tosa Liberals advocated. The statesmen in power conceived that the nation must be educated up to constitutional standards, and that the first step should be to provide an official model. Accordingly, in 1874, arrangements were made for periodically convening an assembly of prefectural governors, in order that they might act as channels of communication between the central authorities and the provincial population, and mutually exchange ideas as to the safest and most effective methods of encouraging progress within the limits of their jurisdictions. This was intended to be the embryo of representative institutions. But the governors, being officials appointed by the cabinet, did not bear in any sense the character of popular nominees, nor could it even be said that they reflected the public feeling of the districts they administered, for their habitual and natural tendency was to try, by means of heroic object-lessons, to win the people's allegiance to the Government's progressive policy, rather than to convince the Government of the danger of overstepping the people's capacities. These conventions of local officials had no legislative power whatever. The foundations of a body for discharging that function were laid in 1875, when a senate (*genro-in*) was organized. It consisted of official nominees, and its duty was to discuss and revise all laws and ordinances prior to their promulgation. It is to be noted, however, that expediency not less than a spirit of progress presided at the creation of the senate. Into its ranks were drafted a number of men for whom no places could be found in the executive, and who, without some official employment, would have been drawn into the current of disaffection. From that point of view the senate soon came to be regarded as a kind of hospital for administrative invalids, but undoubtedly its discharge of quasi-legislative functions proved suggestive, useful, and instructive.

The second meeting of the provincial governors had just been prorogued when, in the spring of 1878, the great minister, Okubo Toshimitsu, was assassinated. Okubo, uniformly ready to bear the heaviest burden of responsibility in every political complication, had stood prominently before the nation as Saigo's opponent. He fell under the swords of Saigo's sympathizers. They immediately surrendered themselves to justice, having taken previous care to circulate a statement of motives, which showed that they ranked the Government's failure to establish representative institutions as a sin scarcely less heinous than its alleged abuses of power. Well-informed followers of Saigo could never have been sincere believers in representative institutions. These men belonged to a province far removed from the scene of Saigo's desperate struggle. But the broad fact that they had sealed with their life-blood an appeal for a political change indicated the existence of a strong public conviction which would derive further strength from their act. The Japanese are essentially a brave people. Throughout the troublous events that preceded and followed the Restoration, it is not possible to point to one man whose obedience to duty or conviction was visibly weakened by prospects of personal peril. Okubo's assassination did not alarm any of his colleagues; but they understood its suggestiveness, and hastened to give effect to a previously formed resolve.

Assassination of Okubo.

Two months after Okubo's death, an edict announced that elective assemblies should forthwith be established in the various prefectures and cities. These assemblies were to consist of members having a high property qualification, elected by voters having one-half of that qualification; the voting to be by signed ballot, and the sessions to last for one month in the spring of each year. As to their functions, they were to determine the method of levying and spending local taxes, subject to approval by the minister of State for home affairs; to scrutinize the accounts for the previous year, and, if necessary, to present petitions to the central Government. Thus the foundations of genuine representative institutions were laid. It is true that legislative power was not vested in the local assemblies, but in all other important respects they discharged parliamentary duties. Their history need not be related at any length. Sometimes they came into violent collision with the governor of the prefecture, and unsightly struggles resulted. The governors were disposed to advocate public works which the people considered extravagant, and further, as years went by and as political organizations grew stronger, there was found in each assembly a group of men ready to oppose the governor simply because of his official status. But on the whole the system worked well. The local assemblies served as training schools for the future parliament, and their members showed devotion to public duty as well as considerable aptitude for debate.

Local government.

This was not what Itagaki and his followers wanted. Their purpose was to overthrow the clique of clansmen who, holding the reins of administrative power, monopolized the prizes of officialdom. Towards the consummation of such an aim the local assemblies helped little. Itagaki redoubled his agitation. He organized his fellow-thinkers into an association called *Jiyuto* (Liberals), the first political party in Japan, to whose ranks there very soon gravitated several men who had been in office and resented the loss of it; many that had never been in office and desired to be; and a still greater number who sincerely believed in the principles of political liberty, but had not yet considered the possibility of immediately adapting such principles to Japan's case. It was in the nature of things that an association of this kind, professing such doctrines, should present a picturesque aspect to the public, and that its collisions with the authorities should invite popular sympathy.

The Liberal party.

Nor were collisions infrequent. For the Government, arguing that if the nation was not ready for representative institutions, neither was it ready for full freedom of speech or of public meeting, legislated consistently with that theory, and entrusted to the police certain powers of control over the press and the platform. The exercise of these powers often created situations in which the Liberals were able to pose as victims of official tyranny, so that they grew in popularity and the contagion of political agitation spread.

The Progressist party.

Three years later (1881) another split occurred in the ranks of the ruling oligarchy. Okuma Shigenobu (afterwards Count Okuma) seceded from the administration, and was followed by a number of able men who had owed their appointments to his patronage, or who, during his tenure of office as minister of finance, had passed under the influence of his powerful personality. If Itagaki be called the Rousseau of Japan, Okuma may be regarded as the Peel. To remarkable financial ability and a lucid, vigorous judgment, he added the faculty of placing himself on the crest of any wave which a genuine *aura popularis* had begun to swell. He too inscribed on his banner of revolt against the oligarchy the motto "Constitutional Government," and it might have been expected that his followers would join hands with those of Itagaki, since the avowed political purpose of both was identical. They did nothing of the kind. Okuma organized an independent party, calling themselves "Progressists" (*Shimpoto*), who not only stood aloof from the Liberals but even assumed an attitude hostile to them. This fact is eloquent. It shows that Japan's first political parties were grouped, not about principles, but about persons. Hence an inevitable lack of cohesion among their elements and a constant tendency to break up into caves and coteries. These are the characteristics that render so perplexing to a foreign student the story of political evolution in Japan. He looks for differences of platform and finds none. Just as a true Liberal must be a Progressist, and a true Progressist a Liberal, so, though each may cast his profession of faith in a mould of different phrases, the ultimate shape must be the same. The mainsprings of early political agitation in Japan were personal grievances and a desire to wrest the administrative power from the hands of statesmen who had held it so long as to overtax the patience of their rivals. He that searches for profound moral or ethical bases will be disappointed. There were no Conservatives. Society was permeated with the spirit of progress. In a comparative sense the epithet "Conservative" might have been applied to the statesmen who proposed to defer parliamentary institutions until the people, as distinguished from the former *samurai*, had been in some measure prepared for such an innovation. But since these very statesmen were the guiding spirits of the whole *Meiji* revolution, it was plain that their convictions must be radical, and that, unless they did violence to their record, they must finally lead the country to representative institutions, the logical sequel of their own reforms.

Okubo's assassination had been followed, in 1878, by an edict announcing the establishment of local assemblies. Okuma's secession in 1881 was followed by an edict announcing that a national assembly would be convened in 1891.

Anti-Government agitation.

The political parties, having now virtually attained their object, might have been expected to desist from further agitation. But they had another task to perform—that of disseminating anti-official prejudices among the future electors. They worked diligently, and they had an undisputed field, for no one was put forward to champion the Government's cause. The campaign was not always conducted on lawful lines. There were plots to assassinate ministers; there was an attempt to employ dynamite, and there was a scheme to incite an insurrection in Korea. On the other hand, dispersals of political meetings by order of police inspectors, and suspension or suppression of newspapers by the unchallengeable verdict of a minister for home affairs, were common occurrences. The breach widened steadily. It is true that Okuma rejoined the cabinet for a time in 1887, but he retired again in circumstances that aggravated his party's hostility to officialdom. In short, during the ten years immediately prior to the opening of the first parliament, an anti-Government propaganda was incessantly preached from the platform and in the press.

Meanwhile the statesmen in power resolutely pursued their path of progressive reform. They codified the civil and penal laws, remodelling them on Western bases; they brought a vast number of affairs within the scope of minute regulations; they rescued the finances from confusion and restored them to a sound condition; they recast the whole framework of local government; they organized a great national bank, and established a network of subordinate institutions throughout the country; they pushed the work of railway construction, and successfully enlisted private enterprise in its cause; they steadily extended the postal and telegraphic services; they economized public expenditures so that the State's income always exceeded its outlays; they laid the foundations of a strong mercantile marine; they instituted a system of postal savings banks; they undertook large schemes of harbour improvement and road-making; they planned and put into operation an extensive programme of riparian improvement; they made civil service appointments depend on competitive examination; they sent numbers of students to Europe and America to complete their studies; and by tactful, persevering diplomacy they gradually introduced a new tone into the empire's relations with foreign Powers. Japan's affairs were never better administered.

The Constitution of 1890.

In 1890 the Constitution was promulgated. Imposing ceremonies marked the event. All the nation's notables were summoned to the palace to witness the delivery of the important document by the Sovereign to the prime minister; salvos of artillery were fired; the cities were illuminated, and the people kept holiday. Marquis[1] Ito directed the framing of the Constitution. He had visited the Occident for the purpose of investigating the development of parliamentary institutions and studying their practical working. His name is connected with nearly every great work of constructive statesmanship in the history of new Japan, and perhaps the crown of his legislative career was the drafting of the Constitution, to which the Japanese people point proudly as the only charter of the kind voluntarily given by a sovereign to his subjects. In other countries such concessions were always the outcome of long struggles

[1] A title of nobility in Japan does not indicate necessarily that its possessor belongs to the ancient aristocracy. In former times titles did not exist. There were official ranks, and very often these were prefixed to a name in the manner of a title. But actual titles were not introduced until 1885. In the interval separating the latter date from the fall of feudalism in 1871, the former territorial chiefs and Court nobles could not be titularly distinguished from commoners. But in 1885 the Emperor, acting on the advice of Ito (afterwards marquis), instituted five orders of nobility (apart from princes of the blood), namely, princes, marquises, counts, viscounts, and barons. These, of course, are translations. The Japanese terms—affixed, not prefixed, to a name—are *kô, kô, haku, shi, dan*. The greatest of the territorial nobles received the title of prince; the smallest, that of baron. The practice was also inaugurated of bestowing titles on men of merit without regard to their original social status. There are no life titles. In 1900 the princes numbered 11, the marquises 33, the counts 89, the viscounts 363, and the barons 280.

between ruler and ruled. In Japan the Emperor freely divested himself of a portion of his prerogatives and transferred them to the people. That view of the case, as may be seen from the story told above, is not untinged with romance; but in a general sense it is true. The framers of the Constitution did not err on the side of liberality. They fixed the minimum age for electors and candidates at twenty-five, and the property qualification at a payment of direct taxes to the amount of 15 *yen* (30 shillings) annually. The result was that only 460,000 persons[1] were enfranchised out of a nation of 42 millions. A bicameral system was adopted for the Diet; the Upper House being in part elective, in part hereditary, and in part nominated by the Sovereign[2]; the Lower consisting of 300 elected members. Freedom of conscience, of speech and of public meeting, inviolability of domicile and correspondence, security from arrest or punishment, except by due process of law, permanence of judicial appointments, and all the other essential elements of civil liberty were guaranteed. In the Diet full legislative authority was vested: without its consent no tax could be imposed, increased, or remitted; nor could any public money be paid out except the salaries of officials, which the Sovereign reserved the right to fix at will. In the Emperor were vested the prerogatives of declaring war and making peace, of concluding treaties, of appointing and dismissing officials, of approving and promulgating laws, of issuing urgency ordinances to take the temporary place of laws, and of conferring titles of nobility.

Working of the system.

No incident in Japan's modern career seemed more hazardous than this sudden plunge into parliamentary institutions. There had been, as shown above, some preparation. Provincial assemblies had partially familiarized the people with the methods of deliberative bodies. But provincial assemblies were at best petty arenas—places where the making or mending of roads, and the policing and scavenging of villages came up for discussion, and where political parties exercised no legislative function nor found any opportunity to attack the Government, or to debate problems of national interest. Thus the convening of a Diet, and the sudden transfer of financial and legislative authority from the throne and its entourage of tried statesmen to the hands of men whose qualifications for public life rested on the verdict of electors, themselves apparently devoid of all light to guide their choice—this sweeping innovation seemed likely to tax severely, if not to overtax completely, the progressive capacities of the nation. What enhanced the interest of the situation was that the oligarchs who held the administrative power had taken no pains to win a following in the political field. Knowing that the opening of the Diet would be a veritable letting loose of the dogs of war, an unmuzzling of the agitators whose mouths had hitherto been partly closed by legal restrictions upon free speech, but who would now enjoy complete immunity within the walls of the assembly, whatever the nature of their utterances—foreseeing all this, the statesmen of the day nevertheless stood severely aloof from alliances of every kind, and discharged their administrative functions with apparent indifference to the changes that popular representation could not fail to induce. This somewhat inexplicable display of unconcern became partially intelligible when the Constitution was promulgated, for it then appeared that the cabinet's tenure of office was to depend solely on the Emperor's will; that ministers were to take their mandate from the Throne, not from Parliament. This fact was merely an outcome of the theory underlying every part of the Japanese polity. Laws might be redrafted, institutions remodelled, systems recast, but amid all changes and mutations one steady point must be carefully preserved, the Throne. The makers of new Japan understood that so long as the sanctity and inviolability of the Imperial prerogatives could be preserved, the nation would be held by a strong anchor from drifting into dangerous waters. They laboured under no misapprehension about the inevitable issue of their work in framing the Constitution. They knew very well that party cabinets are an essential outcome of representative institutions, and that to some kind of party cabinet Japan must come. But they regarded the Imperial mandate as a conservative safeguard, pending the organization and education of parties competent to form cabinets. Such parties did not yet exist, and until they came into unequivocal existence, the Restoration statesmen, who had so successfully managed the affairs of the nation during a quarter of a century, resolved that the steady point furnished by the Throne must not be abandoned.

On the other hand, the agitators found here a new platform. They had obtained a Constitution and a Diet, but they had not obtained an instrument for pulling down the "clan" administrators, since these stood secure from attack under the ægis of the Sovereign's mandate. They dared not raise their voices against the unfettered exercise of the Mikado's prerogative. The nation, loyal to the core, would not have suffered such a protest, nor could the agitators themselves have found heart to formulate it. But they could read their own interpretation into the text of the Constitution, and they could demonstrate practically that a cabinet not acknowledging responsibility to the Legislature was virtually impotent for law-making purposes.

The Diet and the Government.

These are the broad outlines of the contest that began in the first session of the Diet and continued for several years. It is unnecessary to speak of the special points of controversy. Just as the political parties had been formed on the lines of persons, not principles, so the opposition in the Diet was directed against men, not measures. The struggle presented varying aspects at different times, but the fundamental question at issue never changed. Obstruction was the weapon of the political parties. They sought to render legislation and finance impossible for any ministry that refused to take its mandate from the majority in the Lower House, and they imparted an air of respectability and even patriotism to their destructive campaign by making "Anti-clannism" their war-cry, and industriously fostering the idea that the struggle lay between administration guided by public opinion and administration controlled by a clique of clansmen who separated the Throne from the nation. Had not the House of Peers stood staunchly by the Government throughout this

[1] Since the promulgation of the Constitution a Reform Bill has been passed, after several failures owing to disagreement between the two Houses, the House of Peers having shown itself in this matter, as in all others, strongly opposed to the Radical tendencies of the House of Representatives. In the system introduced by this Bill the property qualification for electors was reduced to payment of national taxes amounting to 10 *yen* annually, the number of franchise-holders being thus raised to 800,000, approximately; secret balloting was adopted; no property qualification was required in the case of a candidate for election, neither need he have any connexion with the locality which he sought to represent; the limits of electoral districts were extended so as to embrace whole prefectures, and the number of members of the Lower House was increased to 363.

[2] Princes and marquises sit by right of their titles; counts, viscounts, and barons are elected by their respective orders; each prefecture returns one member representing the highest taxpayers, and the Emperor nominates men of learning or public merit. The House of Peers now contains 319 members. A salary of 2000 *yen* (£200) annually is paid to the members of the Diet; each House has a president, nominated by the Sovereign from among three names selected by the House. He receives 4000 *yen* a year. The vice-president is elected by the House independently of Imperial nomination, and receives 3000 *yen* annually.

contest, it is possible that the nation might have suffered severely from the rashness of the political parties.

There was something melancholy in the spectacle. The Restoration statesmen were the men who had made modern Japan; the men who had raised her, in the face of immense obstacles, from the position of an insignificant Oriental state to that of a formidable unit in the comity of nations; the men, finally, who had given to her a constitution and representative institutions. Yet these same men were now fiercely attacked by the arms which they had themselves nerved; were held up to public obloquy as self-seeking usurpers, and were declared to be impeding the people's constitutional route to administrative privileges, when in reality they were only holding the breach until the people should be able to march into the citadel with some show of orderly and competent organization. That there was no corruption, no abuse of position, is not to be pretended; but on the whole the conservatism of the clan statesmen had only one object—to provide that the newly-constructed representative machine should not be set working until its parts were duly adjusted and brought into proper gear. On both sides the leaders understood the situation accurately. The heads of the parties, while publicly clamouring for parliamentary cabinets, privately confessed that they were not yet prepared to assume administrative responsibilities;[1] and the so-called "clan statesmen," while refusing before the world to accept the Diet's mandates, admitted within official circles that the question was one of time only.

The situation did not undergo any marked change until, the country becoming engaged in war with China (1894–95), domestic squabbles were forgotten in the presence of foreign danger. From that time an era of coalition commenced. Both the political parties joined hands to vote funds for the prosecution of the campaign, and one of them, the Liberals, subsequently gave support to a cabinet under the presidency of Marquis Ito, the purpose of the union being to carry through the Diet an extensive scheme of enlarged armaments and public works planned in the sequel of the war. The Progressists, however, remained implacable, continuing their opposition frankly for the sake of opposition, and without any pretence of consideration for the nature of the measures they opposed.

Fusion of the two parties.

The next phase (1898) was a fusion of the two parties into one large organization which adopted the name "Constitutional Party" (*Kensei-to*). By this union the chief obstacles to parliamentary cabinets were removed. Not only did the Constitutionalists command a large majority in the Lower House, but they also possessed a sufficiency of men who, although lacking ministerial experience, might still advance a reasonable title to be entrusted with portfolios. Immediately the Emperor, acting on the advice of Marquis Ito, invited Counts Okuma and Itagaki to form a cabinet. It was essentially a trial. The party politicians were required to demonstrate in practice the justice of the claim they had been so long asserting in theory. They had worked in combination for the destructive purpose of pulling down the so-called "clan statesmen"; they had now to show whether they could work in combination for the constructive purposes of administration. Their heads, Counts Okuma and Itagaki, accepted the Imperial mandate, and the nation watched the result. There was no need to wait long. In less than six months these new links snapped under the tension of old enmities, and the coalition split up once more into its original elements. It had added a novel word to the language—"office-hunting fever" (*riyokan-netsu*)—and demonstrated that the sweets of power which the "clan statesmen" had been so vehemently accused of coveting possessed even greater attractions for their accusers. The issue of the experiment was such a palpable fiasco that it effectually rehabilitated the "clan statesmen," and finally proved, what had indeed been long evident to every close observer, that without the assistance of those statesmen no political party could hold office successfully.

Enrolment of the clan statesmen in political associations.

Thenceforth it became the unique aim of Liberals and Progressists alike to join hands permanently with the men towards whom they had once displayed such implacable hostility. Marquis Ito, the leader of the *Meiji* statesmen, received special solicitations, for it was plain that he would bring to any political party an overwhelming accession of strength, alike in his own person and in the number of friends and disciples certain to follow him. But Marquis Ito declined to be absorbed into any existing party, or to adopt the principle of parliamentary cabinets. He would consent to form a new association, but it must consist of men sufficiently disciplined to obey him implicitly, and sufficiently docile to accept their programme from his hand. The Liberals agreed to these terms. They actually dissolved their party (August 1900) and enrolled themselves in the ranks of a new organization, which did not even call itself a party, its designation being *Rikken Seiyu-kai* (Association of Friends of the Constitution), and which had for the cardinal plank in its platform a declaration of ministerial irresponsibility to the Diet. A singular page was thus added to the story of Japanese political development; for not merely did the Liberals enlist under the banner of the statesmen whom for twenty years they had fought to overthrow, but they also erased from their profession of faith its essential article, parliamentary cabinets, and by resigning that article to the Progressists, created for the first time an Opposition with a solid and intelligible platform. The whole incident vividly illustrated the fact that persons, not principles, were the bases of political combinations in Japan. Marquis Ito's attraction alone gave cohesion to the *Rikken Seiyu-kai.*

Procedure of the Diet.

It could scarcely have been expected that neither tumult nor intemperance would disfigure the proceedings of a Diet whose members were entirely without parliamentary experience, but not without grievances to ventilate, wrongs (real or fancied) to avenge, and abuses to redress. On the whole, however, there was a remarkable absence of anything like disgraceful license. The politeness, the good temper, and the sense of dignity which characterize the Japanese, always saved the situation when it threatened to degenerate into a "scene." Foreigners entering the House of Representatives in Tôkyô for the first time might easily misinterpret some of its habits. A number distinguishes each member. It is painted in white on a wooden indicator, the latter being fastened by a hinge to the face of the member's desk. When present he sets the indicator standing upright, and lowers it when leaving the House. Permission to speak is not obtained by catching the President's eye, but by calling out the aspirant's number, and as members often emphasize their calls by hammering their desks with the indicators there are moments of decided din. But, for the rest, orderliness and decorum habitually prevail. Speeches have to be made from a rostrum. There are few displays of oratory or eloquence. The Japanese formulates his views with remarkable facility. He is absolutely free from *gaucherie* or self-consciousness when speaking in

[1] Neither the Liberals nor the Progressists had a working majority in the House of Representatives, nor could the ranks of either have furnished men qualified to fill all the administrative posts.

public. He can think on his feet. But his mind has never busied itself much with abstract ideas and subtleties of philosophical or religious thought. Flights of fancy, impassioned bursts of sentiment, appeals to the heart rather than to the reason of an audience, are devices strange to his mental habit. He can be rhetorical, but not eloquent. Among all the speeches hitherto delivered in the Japanese Diet it would be difficult to find a passage deserving the latter epithet. From the first the debates were recorded verbatim. Years before the date fixed for the promulgation of the Constitution a little band of students elaborated a system of stenography and adapted it to the Japanese syllabary. Their labours remained almost without recognition or remuneration until the Diet was on the eve of meeting, when it was discovered that a competent staff of shorthand reporters could be organized at an hour's notice. Japan can thus boast that, alone among the countries of the world, she possesses an exact record of the proceedings of her Diet from the moment when the first word was spoken within its walls. A special feature of the Diet's procedure helps to discourage oratorical displays. Each measure of importance has to be submitted to a committee, and not until the latter's report has been received does serious debate take place. But in ninety-nine cases out of every hundred the committee's report determines the attitude of the House, and speeches are felt to be more or less superfluous. One result of this system is that business is done with a degree of celerity scarcely known in Occidental legislatures. For example, the meetings of the House of Representatives during the session 1896–97 were 32, and the number of hours occupied by the sittings aggregated 116. Yet the result was 55 Bills debated and passed, several of them measures of prime importance, as the Gold Standard Bill, the budget, and a statutory tariff law. Such a record seems difficult to reconcile with any idea of careful legislation; but it must be remembered that although actual sittings of the Houses are comparatively few and brief, the committees remain almost constantly at work from morning to evening throughout the twelve weeks of the session's duration.

Finance.

Financial questions have occupied an important place in the story of Japan's modern career. In order to obtain a clear idea of them it is necessary to make a somewhat extended retrospect. Under the feudal system the land throughout the empire was regarded as State property, and parcelled out into 276 fiefs, great and small, which were assigned to as many feudatories. These held the land in trust, being empowered to derive revenue from it for the support of their households, for administrative purposes, and for the maintenance of armed forces, whose numbers were nominally, but not accurately, regulated in proportion to the wealth of the fief. The basis of taxation varied greatly in different districts, but, at the time of the Restoration in 1867, the generally recognized principle was that four-tenths of the gross produce should go to the feudatory, six-tenths to the farmer. In practice this rule was applied to the rice crop only, the assessments for other kinds of produce being levied partly in money and partly in manufactured goods at rates often of the most arbitrary nature. Forced labour also was exacted, and artisans and tradesmen were subjected to pecuniary levies of greater or less magnitude as official necessity arose. These last two factors, however, are of such uncertain dimensions that they do not admit of arithmetical statement for the purposes of a general review. The total yield of rice in 1867 was 154 million bushels,[1] of which the market value at prices then ruling was 24 million pounds sterling, or 240 millions of *yen*. Hence the grain tax represented, at the lowest calculation, 96 millions of *yen*, the farmers' portion being 144 millions. When the administration reverted to the Emperor in 1867 the central Treasury was empty, and the funds hitherto employed for governmental purposes in the fiefs did not at once begin to flow into the coffers of the State. They continued to be devoted to the support of the feudatories, to the payment of the *samurai*, and to defraying the expenses of local administration, the central Treasury receiving only whatever small fraction might remain after these various outlays. The Shogun himself, whose income amounted to about $3\frac{1}{2}$ millions sterling, did not, on abdicating, hand over to the Sovereign either the contents of his treasury or the control of the lands from which he derived his revenues. He contended that funds for the government of the nation as a whole should be levied from the people at large. Partly owing to this complication, and partly because of the obstinate fealty of some of the Shogun's vassals, swords were drawn, and the impecunious ministry had to engage in campaigns, which, though they placed the Treasury in command of some limited sources of revenue, had also the effect of augmenting its liabilities.

Issue of paper money.

The little band of men who had assumed the direction of national affairs saw no exit from the dilemma except an issue of paper money. This was not a novelty in Japan. Paper money had been known to the people since the middle of the 17th century, and in the era of which we are now writing no less than 1694 varieties of notes were circulating in the 270 fiefs. There were gold notes, silver notes, *cash*-notes, rice-notes, umbrella-notes, ribbon-notes, lathe-article-notes, and so on through an interminable list, the circulation of each kind being limited to the confines of the issuing fief. Many of these notes had almost ceased to have any purchasing power, and nearly all were regarded by the people as evidences of official greed and unscrupulousness. The first duty of a centralized, progressive administration should have been to reform the currency: to substitute uniform and sound media of exchange for these multitudinous and unsecured tokens which hampered trade, destroyed credit, and opposed barriers to commercial intercourse between neighbouring provinces and districts. The political leaders of the time appreciated that duty, but instead of proceeding to discharge it, saw themselves compelled by stress of circumstances to adopt the very device which in the hands of the feudal chiefs had produced such deplorable results. It was an irksome necessity, and the new Government sought to relieve its conscience and preserve its moral prestige by pretending that the object of the issue was to encourage wealth-earning enterprise, and that the notes would be lent to the fiefs for the purpose of promoting commerce and industry. The people appraised these euphemisms at their true worth, and the new notes fell to a discount of 50 per cent. Then ensued a brief but sharp struggle between rulers and ruled. The Government resorted to arbitrary measures, sometimes of great severity, to force its notes into circulation at par with silver. But there was no continuity of policy. One day men were imprisoned for discounting paper tokens; the next, they were released. In December the authorities officially recognized a depreciation of 20 per cent.; in the following April they withdrew the recognition, and proclaimed the equality of specie and paper. Now, they promised to redeem the notes in thirteen years; then, they

[1] This figure represents the closest approximation furnished by statistics. But the reader should be warned that absolute accuracy cannot be claimed for returns compiled before the *Meiji* era.

shortened the period to five, and again they postponed it indefinitely. Nothing is more astonishing than the fact that, despite this bewilderment and vacillation, the Government's financial credit gradually acquired strength, so that within five years, though the issues of paper money aggregated nearly 60 million *yen*, it circulated freely throughout the whole empire at par with silver, and even commanded at one time a small premium. It is true that by this epoch the revenues of all the fiefs had become available for the service of the State, and that only one-tenth of their total had been appropriated for the support of the territorial nobles, now deprived of all administrative functions and reduced to the rank of private gentlemen, without either titles to distinguish them from their former vassals or estates to give them local prestige. But the central Government, having diminished the taxes to about one-third of their former total, as will presently be shown, found the public income too small for the expenditure. The paper money of the fiefs, amounting to 25 million *yen*, had been exchanged for Treasury notes. The building of railways had been commenced. The foundations of an army and a navy had been laid. A postal system, a telegraph system, a prison system, a police system, and an educational system had been organized. The construction of roads, the improvement of harbours, the lighting and buoying of the coast, had been vigorously undertaken. A mercantile marine had been created. Public works had been inaugurated on a considerable scale. Many industrial enterprises had been started under official auspices as object-lessons for the people, and large sums in aid of similar projects had been lent to private persons. Thus the Government, living far beyond its income, had unavoidable recourse to further issues of fiduciary paper, and in proportion as the volume of the latter exceeded the actual currency requirements of the time, its value depreciated until in 1881, fourteen years after the Restoration, notes to the face value of 150 million *yen* had been put into circulation; the Treasury possessed specie amounting to only 8 millions, and 18 paper *yen* could be purchased with ten silver coins of the same denomination.

Method of restoring specie payments.

Up to that year (1881) fitful efforts had been made to strengthen the specie value of fiat paper by throwing quantities of gold and silver upon the market from time to time, and large sums—totalling 23 million *yen*—had been devoted to the promotion of industries whose products, it was hoped, would go to swell the list of exports, and thus draw metallic money to the country. But these superficial devices were now finally abandoned, and the Government applied itself steadfastly to reducing the volume of the fiduciary currency on the one hand and accumulating a specie reserve on the other. The steps of the programme were simple. By applying the pruning knife boldly to administrative expenditure; by transferring certain charges from the Treasury to the local communes; by suspending all grants in aid of provincial public works and private enterprises, and by a moderate increase of the tax on alcohol, an annual surplus of revenue, totalling $7\frac{1}{2}$ million *yen*, was secured. This was applied to reducing the volume of the notes in circulation. At the same time, it was resolved that all officially conducted industrial and agricultural works should be sold —since their purpose of instruction and example seemed now to have been sufficiently achieved—and the proceeds, together with various securities (aggregating 26 million *yen* in face value) held by the Treasury, were applied to the purchase of specie. The latter was a delicate and difficult operation. Had the Government entered the market openly as a seller of its own fiduciary notes, its credit must have suffered. There were also ample reasons to doubt whether any available stores of precious metal remained in the country. In obedience to elementary economical laws, the cheap money had steadily driven out the dear, and although the Government mint at Osaka, founded in 1871, had struck 80 million *yen* worth of gold and silver coins between that date and 1881, when the policy of which we are now speaking was inaugurated, the customs returns showed that a great part of this metallic currency had flowed out of the country. In these circumstances Japanese financiers decided that only one course remained: the Treasury must play the part of national banker. Produce and manufactures destined for export must be purchased by the State with fiduciary notes, and the metallic proceeds of their sales abroad must be collected and stored in the Treasury. This programme required the establishment of consulates in the chief marts of the Occident, and the organization of a great central bank—the present Bank of Japan—as well as of a secondary bank—the present specie bank of Yokohama—the former to conduct transactions with native producers and manufacturers, the latter to finance the business of exportation. The outcome of these various arrangements was that, by the middle of 1885, the volume of fiduciary notes had been reduced to 119 million *yen*, their depreciation had fallen to 3 per cent., and the metallic reserve of the Treasury had increased to 45 million *yen*. The resumption of specie payments was then announced, and became, in the autumn of that year, an accomplished fact.

Reasons against a foreign loan.

These facts rightly stand at the head of a retrospect of Japanese finance, not merely because they set forth a fine economical feat, indicating clear insight, good organizing capacity, and courageous energy, but also because volumes of adverse foreign criticism were written into the margin of the story during the course of the incidents it embodies. Many onlooking strangers were prepared each with an infallible nostrum of his own, the rejection of which convinced him of Japan's hopeless stupidity. Now she was charged with robbing her own people because she bought their goods with paper money and sold them for specie; again, she was accused of an official conspiracy to ruin the foreign local banks because she purchased exporters' bills on Europe and America at rates that defied ordinary competition; and while some declared that she was plainly without any understanding of her own doings, others, averring that she could not possibly extricate herself from the slough of an inflated and largely depreciated fiat currency without recourse to European capital, predicted that her heroic method of dealing with the problem would paralyse industry, interrupt trade, produce widespread suffering, and, in short, bring about the advent of the proverbial seven other devils. Undoubtedly, to carry the currency of a nation from a discount of 70 or 80 per cent. to par in the course of four years, reducing its volume at the same time from 150 to 119 millions, was a financial enterprise violent and daring almost to rashness. The gentler expedient of a foreign loan would have commended itself to the majority of economists. But it may be here stated, once for all, that until her adoption of gold monometallism in 1897,[1] the foreign money market was practically closed to

[1] This operation should be called more properly a reversion to gold monometallism. The currency system established by Japanese financiers at the beginning of the *Meiji* era was based on the gold standard, the unit being the gold *yen*, a coin worth four shillings in round numbers. But, in the first place, Japan's stock of gold was soon driven out of the country by her depreciated fiat currency, and, in the second, as all the other Oriental nations were silver-using, and as the silver Mexican dollar was the unit of accounts in Far Eastern trade, Japan ultimately drifted into silver monometallism, the silver

Japan. Had she borrowed abroad it must have been on a sterling basis. Receiving a fixed sum in silver, she would have had to discharge her debt in rapidly appreciating gold. Twice, indeed, she had recourse to London for small sums, but when she came to cast up her accounts the cost of the accommodation stood out in deterrent proportions. A 9 per cent. loan, placed in England in 1868 and paid off in 1889, produced $4\frac{3}{4}$ million *yen*, and cost altogether $11\frac{3}{4}$ millions in round figures; and a 7 per cent. loan, made in 1872 and paid off in 1897, produced $10\frac{3}{4}$ millions, and cost 36 millions. These considerations were supplemented by a strong aversion from incurring pecuniary obligations to Western states before the latter had consented to restore Japan's judicial and tariff autonomy, a point which will be fully explained by and by. The example of Egypt showed what kind of fate might overtake a semi-independent state falling into the clutches of foreign bondholders. Japan did not wish to fetter herself with foreign debts while struggling to emerge from the ranks of Oriental Powers. After all, nothing succeeds like success. Japanese financiers made a signal success. Having undertaken to reorganize the administration of an empire, and to inaugurate a vast programme of reform, they met the difficulty of an empty Treasury by issuing fiat notes, and then, fourteen years later, grappling boldly with the problem of this inflated and heavily depreciated currency, they restored its value to par and resumed specie payments in the brief space of four years.

The national debt.

It is advisable at this point to examine the question of the national debt incurred by Japan since the unification of the empire. As already stated, when the fiefs were surrendered to the Sovereign, it was decided to provide for the feudal nobles and the *samurai* in general by the payment of lump sums in commutation, or by handing to them public bonds, the interest on which should constitute a source of income. The result of this transaction, into the details of which we need not enter, was that bonds having a total face value of $191\frac{1}{2}$ million *yen* were issued, and ready-money payments aggregating $21\frac{1}{4}$ million *yen* were made.[1] This was the foundation of Japan's national debt. Indeed, these public bonds may be said to represent the bulk of the State's liabilities during the first twenty-five years of the *Meiji* period. The Government had also to take over the debts of the fiefs, amounting to 41 million *yen*, of which $21\frac{1}{2}$ millions were paid with interest-bearing bonds, the remainder with ready money. If to the above figures we add two foreign loans aggregating $16\frac{1}{2}$ million *yen* (completely repaid by the year 1897); a loan of 15 million *yen* incurred on account of the only serious rebellion that marked the passage from the old to the new régime—the Satsuma revolt of 1877; loans of 33 million *yen* for public works, 13 million *yen* for naval construction, and $14\frac{1}{2}$ millions[2] in connexion with the fiat currency, we have a total of 305 million *yen*, being the whole national debt of Japan during the first twenty-eight years of her new era under Imperial administration.

War expenditures.

The above statements sufficiently explain the liabilities incurred by the country during what may be called the first epoch of her modern financial history. We now pass to the second epoch, dating from the war with China in 1894–95. The direct expenditures on account of the war aggregated 200 million *yen*, of which total 135 millions were added to the national debt, the remainder being defrayed with accumulations of surplus revenue, with a part of the indemnity received from China, and with voluntary contributions from patriotic subjects. As the immediate sequel of the war, the Government elaborated a large programme of armament expansion and public works. The army, at the time of the war, consisted of six divisions and the imperial guards; the peace establishment being 70,000, and the war strength 268,000. The navy comprised 33 vessels—exclusive of 26 torpedo-boats—representing a displacement of 63,000 tons. It was resolved to raise the number of divisions to twelve, with a peace establishment of 145,000 and a war strength of 560,000, and the navy to 67 ships[3] (besides 11 torpedo-catchers and 115 torpedo-boats), with an aggregate displacement of 258,000 tons. The expenditure for these unproductive purposes, as well as for coast fortifications, dockyards, and so on, came to 314 million *yen*, and the total of the productive expenditures included in the programme was 190 million *yen*—namely, 120 millions for railways, telegraphs, and telephones; 20 millions for riparian improvements[4]; 20 millions in aid of industrial and agricultural banks, and so forth—the whole programme thus involving an outlay of 504 million *yen*. To meet this large figure, the Chinese indemnity, surpluses of annual revenue and other assets, furnished 300 millions; and it was decided that the remaining 204 millions should be obtained by domestic loans, the programme to be carried completely into operation—with trifling exceptions—by the year 1905. In practice, however, it was found impossible to obtain money at home without paying a high rate of interest. The Government, therefore, had recourse to the London market in 1899, raising a loan of 10 million pounds sterling at 4 per cent., and selling the £100 bonds at 90. In this matter of raising loans it is of course impossible here to anticipate subsequent events. In 1902 it was not expected that Japan

yen becoming her unit of currency. So soon, however, as the indemnity that she received from China after the war of 1894–95 had placed her in possession of a stock of gold, she determined to revert to the gold standard. Mechanically speaking, the operation was very easy. Gold having appreciated so that its value in terms of silver had exactly doubled during the first thirty years of the *Meiji* era, nothing was necessary except to double the denominations of the gold coins in terms of *yen*, leaving the silver subsidiary coins unchanged. Thus the old 5-*yen* gold piece, weighing 2·22221 *momme* of 900 fineness, became a 10-*yen* piece in the new currency, and a new 5-*yen* piece of half the weight was coined. No change whatever was required in the reckonings of the people. The *yen* continued to be their coin of account, with a fixed sterling value of a little over two shillings, and the denominations of the gold coins were doubled. Gold, however, is little seen in Japan; the whole duty of currency is done by notes.

[1] The amounts include the payments made in connexion with what may be called the disestablishment of the Church. There were 29,805 endowed temples and shrines throughout the empire, and their estates aggregated 354,481 acres, together with $1\frac{3}{4}$ million bushels of rice (representing $2\frac{1}{2}$ millions of *yen*). The Government resumed possession of all these lands and revenues at a total cost to the State of a little less than $2\frac{1}{2}$ million *yen*, paid out in pensions spread over a period of fourteen years. The measure sounds like wholesale confiscation. But some extenuation is found in the fact that the temples and shrines held their lands and revenues under titles which, being derived from the feudal chiefs, depended for their validity on the maintenance of feudalism.

[2] This sum represents interest-bearing bonds issued in exchange for fiat notes, with the idea of reducing the volume of the latter. It was a tentative measure, and proved of no value.

[3] Japan's fleet at the time of the war consisted of comparatively small vessels, the largest being three coast-defence ships of 4278 tons. She captured from China an armour-clad of 7335 tons—the first line-of-battle-ship in her navy. Her *post-bellum* fleet, as planned (1901), included 6 first-class battle-ships, ranging from 12,500 to 15,000 tons approximately; 6 first-class cruisers of 9200 tons; 9 second-class cruisers, ranging from 3700 to 4800 tons; 10 third-class cruisers, ranging from 3300 tons, &c. (See also NAVIES.)

[4] Japan suffers severely from inundations. Many of the rivers have been banked up in the course of centuries until their beds lie considerably above the level of the surrounding country, and a breach of the embankments involves widespread disaster. It has been estimated that the average annual loss from this source does not fall short of 19 million *yen*. In 1887 an extensive scheme of riparian improvement was undertaken. It involved a total expenditure of 26 million *yen*, of which 6 millions had been expended when the war with China broke out.

would need any further immediate recourse to foreign borrowing. According to existing arrangements, Japan's national indebtedness would reach its maximum, namely, 575 million *yen*, in the year 1903, and would thenceforward diminish steadily.[1] It remains to consider briefly the annual revenues and expenditures of the State, and the manner of their growth during recent years.

Budget. The burden of taxation is small, especially compared with the career of vigorous progress upon which the country has embarked. Only 120 million *yen* was raised in 1900 by direct taxes; that is to say, something less than 3 *yen* (6 shillings) per head of population. The sources were these:—

	Millions of Yen.
Land tax	47
Income tax	5
Business tax	6
Sake (rice wine) tax	56
Soy (fish sauce) tax	3
Miscellaneous taxes	3
Total	120

A further sum of 72 million *yen* was obtained by indirect taxation, namely:—

	Millions of Yen.
Customs and tonnage dues	16
State undertakings (railways, posts, telegraphs, tobacco monopoly, and forests)	43
Stamp duties	11
Miscellaneous	2
Total	72

On the other hand, the ordinary expenditure aggregated 149 million *yen*. Thus there was a surplus of 43 million *yen*. For the moment this surplus was absorbed for extraordinary and terminable enterprises forming part of the *post-bellum* programme described above, but in a short time the country might look forward to finding itself with a substantial annual balance on the right side.

Credit. It is remarkable that, in spite of the conclusive evidence furnished by such figures as these, there should have prevailed in Europe and America up till a comparatively recent date an impression that Japan's financial condition was not sound. The misapprehension was mainly due to the fact that the national expenditure grew from 63 million *yen* to 149 millions in the ten years ending 1900. Not unnaturally, such a rate of increase seemed startling. The development of the revenue in the same time from 76 millions to 192 millions appears to have escaped attention, or possibly even accentuated the distrust by suggesting excessive taxation. Looking at the figures without any reference to the past, it is necessary to admit that excellent financial management is required in order that a nation of 43½ million inhabitants, which maintains an army of half a million of men and a fleet of 258,000 tons, may pay its way at a cost of less than fifteen million pounds sterling. Such a feat presents itself in a scarcely credible light to Occidental statesmen. Again, observing that the annual expense of maintaining the army and navy is only 55 million *yen*, whereas the tax on *sake* (rice wine) alone yields 56 millions, and noting that this tax — which falls on a luxury—grew from 4 million *yen* in 1891 to 56 millions in 1900, it seems plain that if the country has greatly increased its armaments, there has been found at the same time a compensatory source of revenue which does not add seriously to the burdens of the people at large. Further, that a large reserve of taxable capacity exists cannot be doubted. It has been shown above that before the fall of the feudal system the farmer paid into the local treasury two-fifths of his whole rice crop. The average annual yield of rice at present is 200 million bushels, and the monetary value of two-fifths of that quantity is 150 million *yen*, in round numbers, whereas the total tax levied on the land is only 47 millions. Thus the difference is more than three to one in favour of the present system. Another factor which has operated injuriously to Japan's credit is that her politicians, by assaults upon the budget in the Diet and by clamouring for a reduction of the land tax as well as of official salaries, greatly misled the foreign public. That this outcry was merely a convenient weapon for attacking the cabinet and courting favour with the constituencies was amply proved in the sequel, when these same agitators voted to increase the land tax and to augment official salaries. But they had sustained the clamour so vigorously and incessantly during session after session of the Diet, that the world ultimately learned to regard Japan as a country crushed by a weight of taxation which the people's representatives were vainly struggling to lighten, and preyed upon by a number of overpaid officials whom the Diet was seeking to deprive of their excessive emoluments. Accepting the estimates made by the Japanese themselves, Europe and America regarded Japan as an embarrassed country, instead of recognizing the abundance and elasticity of her resources.

The wealth of Japan is a subject which has not yet been investigated so thoroughly that an altogether trustworthy statement can be made. The following figures give the closest approximations possible in 1901:—

	Millions of Yen.
Value of lands (agricultural, building, forest, &c.)	3600
Value of buildings	1100
Value of household furniture and utensils	550
Value of cattle, horses, fowls, &c.	60
Value of railways	250
Value of mercantile marine	33
Value of merchandise	430
Gold and silver bullion and coins	250
Miscellaneous	2000
Total	8273

It will be observed that this sum is approximately one-tenth of the accumulated capital of Great Britain and Ireland. That is what might have been expected, for, speaking roughly, money is ten times as valuable in Japan as in the United Kingdom.

With regard to the income derived by Japan from her capital, the following figures are deduced from the best statistics:—

	Millions of Yen.
Products of agriculture, forestry, and fisheries	750
Produce of mines	30
Manufactured articles	400
Land-transport earnings	90
Water-transport earnings	15
House rent	28
Profits on foreign trade	25
Banking profits	27
Profits on business	98
Total	1463

The development of Japan's foreign trade was checked

[1] All Japan's domestic loans are now placed on a uniform basis. They carry 5 per cent. interest, run for a period of 5 years without redemption, and are then redeemed within 50 years at latest. The Treasury has competence to expedite the operation of redemption according to financial convenience, but the sum expended on amortization each year must receive the previous consent of the Diet. Within the limit of that sum redemption is effected either by purchasing the stock of the loans in the open market or by drawing lots to determine the bonds to be paid off. Perhaps a more suggestive idea may be furnished of Japan's finance during the *Meiji* era if we say that, owing to the processes of conversion, consolidation, &c., and to the various requirements of the State's progress, twenty-two different kinds of national bonds were issued from 1870 to 1896; that they aggregated 673,215,500 *yen*; that 269,042,198 *yen* of that total had been paid off at the close of 1897, and that the remainder will be redeemed, according to the present programme, by 1946.

at first not only by the unpopularity attaching to all intercourse with outside nations, but also by embarrassment resulting from the difference between the silver price of gold in Japan and its silver price in Europe, the precious metals being connected in Japan by a ratio of 1 to 5, and in Europe by a ratio of 1 to 15. This latter fact led to some arbitrary and even disgraceful doings on the part of foreign traders, and was also the cause of a sudden and violent appreciation of values; for the Government, seeing the country threatened with loss of all its gold, tried to avert the catastrophe by altering and reducing the weights of the silver coins without altering their denominations, and a corresponding difference exhibited itself, as a matter of course, in the silver quotations of commodities. Another source of difficulty was the attitude of officialdom. During several centuries, Japan's over-sea trade had been under the control of the Government, to whose coffers it contributed a substantial revenue. But when the foreign exporter entered the field under the conditions created by the new system, he diverted to his own pocket the handsome profit previously accruing to the Government; and since the latter could not easily become reconciled to this loss of revenue, or wean itself from its traditional habit of interference in affairs of foreign commerce, and since the foreigner, on his side, not only desired secrecy in order to prevent competition, but was also tormented by inveterate suspicions of Oriental espionage, not a little friction occurred from time to time. Thus the impression suggested by the scanty records of that early epoch is that trade was beset with great difficulties, and that the foreigner had to contend against most adverse circumstances, though in truth his gains amounted to 40 or 50 per cent.

The chief staples of the early trade were tea and silk. It happened that just before Japan's raw silk became available for export, the production of that article in France and Italy had been largely curtailed owing to a novel disease of the silkworm. Thus, when the first bales of Japanese silk appeared in London, and when it was found to possess qualities entitling it to the highest rank, a keen demand sprang up, so that in 1863, the fourth year after the inauguration of the trade, no less than 2¼ million ℔ were shipped. Japanese green tea also, differing radically in flavour and bouquet from the black tea of China, appealed quickly to American taste, so that 6 million ℔ of it were sent across the Pacific in 1863. The corresponding figures for these two staples in 1899 were 14 million ℔ and 46 million ℔ respectively. This remarkable development is typical of the general history of Japan's foreign trade in modern times. Omitting the first decade, the statistics for which are imperfect, the volume of the trade grew from 5¾ millions sterling in 1868 to 43½ millions in 1899. It was not a uniform growth. The period of 32 years divides itself conspicuously into two eras: the first, of 18 years (1868–85), during which the development was from 5¾ millions to 13 millions, a ratio of 1 to 2¼, approximately; the second, of 14 years (1886–99), during which the development was from 13 millions to 42½ millions, a ratio of nearly 1 to 4.

That a commerce which did little more than double itself in the first eighteen years should have nearly quadrupled in the next fourteen is a fact inviting attention. There are two principal causes: one general, the other special. The general cause was that several years necessarily elapsed before the nation's material condition began to respond perceptibly to the improvements effected by the *Meiji* Government in matters of administration, taxation, and transport facilities. Fiscal burdens had been reduced and security of life and property obtained, but railway building and road-making, harbour construction, the advantages of posts, telegraphs, exchanges and banks, and the development of a mercantile marine did not exercise a sensible influence on the nation's prosperity until 1884 or 1885. From that time the country entered a period of steadily growing prosperity, and from that time private enterprise may be said to have finally started upon a career of independent activity. The special cause which, from 1885, contributed to a marked growth of trade was the resumption of specie payments. Up to that time the Treasury's fiat notes had suffered such marked fluctuations of specie value that sound or successful commerce became very difficult. Against the importing merchant the currency trouble worked with double potency. Not only did the gold with which he purchased goods appreciate constantly in terms of the silver for which he sold them, but the silver itself appreciated sharply and rapidly in terms of the fiat notes paid by Japanese consumers. Cursory reflection may suggest that these factors should have operated inversely to stimulate exports as much as they depressed imports. But such was not altogether the case in practice. For the exporter's transactions were always hampered by the possibility that a delay of a week or even a day might increase the purchasing power of his silver in Japanese markets by bringing about a further depreciation of paper, so that he worked timidly and hesitatingly, dividing his operations as minutely as possible in order to take advantage of the downward tendency of the fiat notes. Not till this element of pernicious disturbance was removed did the trade recover a healthy tone and grow so lustily as to tread closely on the heels of the foreign commerce of China, with her 300 million inhabitants and long-established international relations.

Japan's trade with the outer world was built up chiefly by the energy and enterprise of the foreign middleman. He acted the part of an almost ideal agent. As an exporter, his command of cheap capital, his experience, his knowledge of foreign markets, and his connexions enabled him to secure sales such as must have been beyond reach of the Japanese working independently. Moreover, he paid to native consumers ready cash for their staples, taking upon his own shoulders all the risks of finding markets abroad. As an importer, he enjoyed, in centres of supply, credit which the Japanese lacked, and he offered to native consumers foreign produce laid at their doors with a minimum of responsibility on their part. Finally, whether as exporters or importers, foreign middlemen always competed with each other so keenly that their Japanese clients obtained the best possible terms from them. Yet the ambition of the Japanese to oust them cannot be regarded as unnatural. Every nation must desire to carry on its own commerce independently of alien assistance, and it may be added that certain features of the foreigner's methods in Japan have rendered his intervention specially irksome. His practice is openly based on the hypothesis that no Japanese tradesman is trustworthy, and he takes frequent occasion to proclaim his want of confidence. Undoubtedly this distrust has had justification. Social conditions in Japan during feudal centuries were altogether unfavourable to the development of a "commercial conscience," and there has not yet been time for the new order of things to produce a radical improvement in that respect. Japanese publicists themselves frankly recognize this unfortunate fact, but the average tradesman can scarcely be expected to admit it. He resents being preached to about commercial morality by foreigners whom he himself considers arbitrary, exacting, and often unjust. He is jealous, too, of the strangers' manner of life. Their comparatively fine mansions, their carriages and their apparently profuse expenditure, suggest that they derive princely incomes from their business. Thus there are several reasons for wishing to dispense with the alien, and it is plain that these reasons are operative;

for whereas in 1888 native merchants carried on only 12 per cent. of the country's foreign trade without the intervention of foreign middlemen, their share rose to 35 per cent. in 1899. That this rate of increase would be steadily maintained was not, however, an inference to be accepted. The day is still distant when Japanese merchants can hope to establish with the Occident relations of such mutual intimacy and confidence as will enable them to take the place now occupied by foreign middlemen.

Balance of trade. Analysis of Japan's foreign trade during the *Meiji* era (1868 to 1899, inclusive) shows that imports exceeded exports in 17 years and that exports exceeded imports in 15 years. This would suggest a tolerably well balanced trade. But closer examination does not confirm the suggestion. Reckoning from 1872, when returns relating to movements of specie became available for the first time, it is found that imports totalled 218½ millions sterling and exports 186¼ millions, so that the excess of imports was 32¼ millions. On the other hand, the exports of specie for the same time were 38 millions sterling and the imports 33 millions, showing an excess of 5 millions on the side of exports. Obviously Japan cannot have paid for imports worth 32¼ millions sterling by a disbursement of only 5 millions. This apparent anomaly admits of an easy explanation. After the war of 1894–95, Japan received from China an indemnity of 36½ millions of pounds, out of which she brought 18⅝ millions into the country. Further, in 1898 she sold bonds to the value of 4½ millions in the London market and caused the money to be sent to Tôkyô. If these 23 millions be taken into account, the excess of unpaid-for imports is reduced to 4¼ millions sterling, the greater part of which, if not the whole, is accounted for by the expenditures of foreigners resident in the country and of tourists visiting it. There could be no question, however, that Japan's foreign trade was causing an outflow of her specie. Only within the four years 1896 to 1899, however, was the balance seriously against her, the imports for that period totalling 91½ millions sterling and the exports 66 millions. Doubtless the explanation is to be sought in the fact that after 1896 the Government was spending great sums on works connected with the *post-bellum* programme of armament expansion, and that the millions thus scattered among the people have increased their purchasing power to an abnormal extent.

Commercial prospects. It can scarcely be doubted that the future development of Japan's trade will be in the direction of manufactures. She will always be able to send abroad considerable quantities of raw silk and tea and comparatively inconsiderable quantities of marine products,[1] copper, coal,[2] camphor, sulphur, rice and minor staples, but, with regard to these, either her producing capacity is inelastic or her market is limited. It is certain, indeed, that she will by and by have to look abroad for supplies of the necessaries of life. Rice is the staple diet of her people, and she seems almost to have reached the potential maximum of her rice-growing area; for, in spite of her genial climate and seemingly fertile soil, the extent of her arable land is disproportionately small. She has only 11½ millions of acres under crops, and there is no prospect of any large extension, or of the yield being improved by new agricultural processes. The Japanese farmer understands his work thoroughly. His competence is sufficiently proved when we say that, by the skilful use of fertilizers, he has been able to raise good crops of rice on the same land during fifteen or twenty centuries. On the other hand, not only is the population increasing at the rate of half a million annually, but in proportion to the growth of general prosperity and the distribution of wealth, the lower classes of the people, who used formerly to be content with barley and millet, now regard rice as an essential article of food. It cannot be long, therefore, before large supplies of this cereal will have to be drawn from abroad. The same is true of timber, which has already become inconveniently scarce. Further, Japan cannot even grow her own cotton, and nature has not fitted her pastures for sheep, so that much of the material for her people's clothing has to be imported. Her future lies undoubtedly in industrial enterprise. She has an abundance of cheap labour, and her people are exceptionally gifted with intelligence, docility, manual dexterity, and artistic taste. Everything points to a great future for them as manufacturers. This is not a matter of mere conjecture. Striking practical evidence has already been furnished. Cotton-spinning may be specially referred to. As long ago as 1862 the feudal chief of Satsuma started a mill with five thousand spindles. During a whole decade he found only one imitator. In 1882, however, a year which may be regarded as the opening of Japan's industrial era, this enterprise began to attract capital, and in the course of four years 15 mills were established, working 55,000 spindles. By foreign observers this new departure was regarded with contemptuous amusement. The Japanese were declared to be without organizing capacity, incapable of sustained energy, and generally unfitted for factory work. These pessimistic views had soon to be radically modified, for by 1897 the number of mills had increased to 63; the number of spindles, to some 800,000; the capital invested, to 21 million *yen*, and the average annual profit per spindle was 3½ *yen*, or 13½ per cent. on the capital. The rapidity of this development suggests unsoundness, but speed is a marked characteristic of Japan's modern progress. In 1880, for example, a man named Isozaki, of Okayama prefecture, carried to Kobe a specimen of a new kind of floor-mat, the outcome of two years' thought and trial. Briefly described, it was matting with a weft of fine green reeds and a warp of cotton yarn, having a coloured design woven into it. Isozaki found difficulty in getting any one to test the saleability of his invention by sending it abroad. Sixteen years later the "brocade-matting" industry of Okayama prefecture alone occupied 734 weaving establishments, with 9085 stands of looms; gave employment to 9357 artisans, of whom 5335 were females, and turned out 2¼ million *yen* worth of this pretty floor-covering. Meanwhile, the total value of the industry's output throughout the empire had reached nearly 6 million *yen*, and the quantity exported stood at nearly 4 millions approximately in the customs returns. Here, then, is a trade which rose from nothing to a position of importance in sixteen years. Even more remarkable in some respects has been the development of the textile industry. In 1884 the total production of silk and cotton fabrics was 6 million *yen*; in 1898 it had increased to 110 millions.[3] The manufacture of

[1] Japan's fishing industry is doubtless capable of great development. She has 17,602 miles of coast, and 270,000 families devoted to fishing, or more than 15 families to each mile. They employ 330,706 boats and 1,194,408 nets, representing a capital of about 3 millions sterling, and the total value of the annual catch is put at 5 millions sterling, though 10 millions would probably be nearer the truth. The fishermen are sturdy, courageous fellows, but their methods are primitive and virtually no improvements have yet been introduced.

[2] It was at one time supposed that Japan possessed great mineral wealth, but the question remains uncertain. The output of her various mines increases steadily, it is true, but its total annual value does not exceed 3 millions sterling. Recently gold has been discovered in seemingly large quantities in Hokkaido, and kerosene in Echigo as well as in Hokkaido. The practical value of these discoveries remains to be determined.

[3] The Japanese have been skilled weavers for many centuries, but

lucifer matches is another industry of entirely recent growth. A few years ago Japan used to import all the matches she needed, but by 1899 she was able not only to supply her own wants, but also to send abroad 6 million *yen* worth. Without carrying these statistics to wearisome length, it will suffice to note that, in six branches of manufacturing industry which may be said to have been called into active existence by the opening of the country — namely, silk and cotton fabrics, cotton yarns, matches, fancy matting, and straw braid—Japan's exports in 1888 aggregated only $\frac{1}{4}$ million *yen*, whereas the corresponding figure for 1899 was 68 millions. With such results on record, it is impossible to doubt that Japan has a great manufacturing future. The fact has, indeed, been partially recognized and much talked of within the past few years, especially in the United States, where the prospect of Japanese industrial competition was recently presented to the public in almost alarming proportions. On the other hand, among foreigners resident in Japan the general estimate of native manufacturing capacity is low. Doubtless, as is usually the case, the truth lies between the two extremes. Japanese industrial competition will be a formidable fact one of these days, but the time is still distant. Progress is checked by one manifest obstacle, defective integrity. Concerning every industry whose products have found a place in the catalogue of modern Japan's exports, the same story has to be told: just as really substantial development seemed to be visible, fraudulent adulteration or dishonestly careless technique interfered to destroy credit and disgust the foreign consumer. The Japanese deny that the whole responsibility for these disastrous moral *laches* rests with them. The treaty-port middleman, they say, buys so thriftily that high-quality goods cannot be supplied to him. That excuse may be partially valid, but it is certainly not exhaustive. The vital importance of establishing and maintaining the reputation of an article offered newly in markets where it has to compete with rivals of old-established excellence is not yet fully appreciated in Japan. As to organizing capacity, the possession of which by the Japanese has been strenuously doubted by more than one foreign critic, there are proofs more weighty than any theories. In the cotton-spinning industry, for example, the Japanese are brought into direct competition in their own markets with Indian mills employing cheap native labour, organized and managed by Englishmen, and having the raw material at their doors. The victory rests with the Japanese, from which it may fairly be inferred that their organization is not specially defective or their method costly.[1] Yet there is one consideration that must not be lost sight of: it is the inexperience of the Japanese; their lack of standards. Japan is dressing herself in a material civilization that was made to the measure of alien nations, and curious misfits are inevitably developed in the process. If the England of 1837, for example—that is to say, England as she was at the commencement of the Victorian era—could have been suddenly projected forward to 1897, and invited to adapt herself to the moral and material conditions of the latter period, the task, though almost inconceivably difficult, would have been easier than that which Japan set herself in 1870, for England would at least have possessed the preliminary training, the habit of mind, and the trend of intelligence, all of which were wanting to Japan. This essential difference should be easy to remember, yet it is constantly forgotten by observers of Japan's progress. Again and again they make the mistake of measuring her acts by the standards to which they have themselves been educated. Again and again they fall into the error of deducing from her failures and perplexities the same inferences that similar perplexities and failures would suggest in Europe or America. If the citizens of Tôkyô hesitate to spend large sums upon street repair, they are accused of blind parsimony, though the fact is that, never having had any practical knowledge of really fine roadways, they have not yet learned to appreciate them. If Japanese officials do not at once succeed in solving the very difficult problem of Formosan administration, it is concluded that they lack administrative ability, though absolute lack of experience suffices to account for their ill-success. If the people have not yet made any significant contribution to the sum of Occidental scientific knowledge or mechanical contrivances, they are dismissed as imitative, not initiative, which is much as though we should charge a lad with want of originality because, having barely mastered the integral calculus, he did not write some new chapters on quaternions. If they have not yet reduced constitutional government to a smoothly working system, have not yet emerged from a confusion of political coteries into the orderly condition of two great parties, each capable of assuming and discharging administrative responsibilities, they are declared unfit for representative institutions, though they have tried them for only a few years after fifteen centuries of military feudalism or hereditary oligarchy. If they do not carry on their new industries with the minimum of efficient labour, and if they fail to appreciate the economical necessity of bestowing constant care upon the machinery and of seeking to rise above first results instead of regarding them as the *ne plus ultra* of subsequent achievement, they are pronounced radically deficient in the industrial instinct, whereas the truth is that they have not as yet any accurate perception of the standards which experience and competition have established in foreign countries. The condition of their army and of their navy shows that not capacity but practice is what the Japanese lack. These two services are altogether modern creations. There was nothing in the history of Japan to suggest her competence for managing such machines. Yet the excellence of her military organization was fully demonstrated in her campaign against China in 1894–95, and again in the Peking expedition of 1900. In the former she had to undertake the most difficult task that falls to the lot of a belligerent, the task of sending over-sea two *corps d'armée* (aggregating a hundred and twenty thousand men), and maintaining them for several months in widely separated fields—one in eastern and central Manchuria; the other in the Liaotung peninsula, and, subsequently, in Shantung province. The effort did not appear to embarrass her. There was no sign of confusion or perplexity; no breakdown of the commissariat or transport arrangements; no failure of the ambulance or hospital service. Everything worked smoothly, and the public were compelled to recognize that Japan had not only elaborated a very efficient piece of military mechanism,

a great impetus was given to this enterprise by the introduction of improved machinery and the use of aniline dyes, after the opening of the country to foreign intercourse. Indigo has always been the staple dye-stuff of the country. Twenty million *yen* worth is produced annually. But for colours other than blue and its various tones, aniline dyes are now imported to the extent of $1\frac{1}{4}$ million *yen* yearly. The growth of the textile industry has also been greatly stimulated by the introduction of cotton yarns of fine and uniform quality. Formerly all cotton cloths were woven out of coarse, irregular handspun yarns, so that nothing like regularity of weight and texture could be secured. It thus appears that Japan owes the remarkable development of her textile industry to foreign intercourse.

[1] Japanese mills are kept at work twenty-three hours out of the twenty-four, with one shift of operatives, and their production per spindle is 40 per cent. greater than the production at Bombay mills and nearly double the production at English mills.

but had also developed ability to employ it to the best advantage. The same inference was suggested by her navy. Although during two and a half centuries her people had been debarred by arbitrary legislation from navigating the high seas, the twenty-fifth year after the repeal of these crippling laws saw the State in possession of a squadron of thirty-three serviceable ships of war, officered and manned solely by Japanese, constantly manœuvring in distant waters without accident, and evidently possessing all the qualities of a fine fighting force. In the war with China this navy showed its capacity by destroying or capturing, without the loss of a single ship, the whole of the enemy's fleet, whereas the latter's superiority in armour and armament ought to have produced a very different issue. On the other hand, a visit to Japanese factories often shows machinery treated carelessly, employés so numerous that they impede rather than expedite business, and a general lack of the precision, regularity, and earnestness that characterize successful industrial enterprises in Europe and America. Achievement in one direction and comparative failure in another, although the factors making for success are similar in each, indicate, not incapacity in the latter case, but defects of standard and experience. The vast majority of the Japanese have no adequate conception of what is meant by a highly-organized industrial or commercial enterprise.[1] They have never made the practical acquaintance of anything of the kind, nor even breathed a pure business atmosphere.[2] For elaborating their military and naval systems they had close access to foreign models, every detail of which could be carefully scrutinized, and they availed themselves freely of the assistance of foreign experts—French, German, and British. But in the field of manufacture and trade their inspection of foreign models is necessarily superficial, and they are without the co-operation of foreign experts. It may be supposed that, since the foreign middleman plays such an important part in the country's over-sea commerce, his skill and experience must have been equally available for the purposes of industrial enterprise. But two difficulties stood in the way: one legal, the other sentimental. The treaties forbade foreigners to hold real estate or engage in business outside the limits of the settlements, thus rendering it impossible for them either to start factories on their own account or to enter into partnership with native manufacturers; and an almost morbid anxiety to prove their independent competence impelled the Japanese to dispense prematurely with the services of foreign employés. Rapid as has been the country's material progress, it might have been at once quicker and sounder had these restrictive treaties been revised a dozen years earlier, when Japan was still upon the threshold of her manufacturing career, and before repeated failures to obtain considerate treatment at the hands of Western Powers had prejudiced her against foreigners in all capacities. In 1885 she was ready to welcome the Occidental to every part of the country, regarded it as a matter of course that he should own real estate, and would gladly have become his partner in commerce or manufactures. In 1895 she had come to suspect that closer association with him might have dangers and disadvantages, and that the soil of Japan ought to be preserved from falling into his possession. There are clear evidences that this mood, so injurious to her own interests, is being replaced by more liberal sentiments, but in the meanwhile she has been induced to stand aloof from alien aids at a time when they might have profited her immensely, and to struggle without guidance towards standards of which she has as yet only a dim perception. Already, too, some of the advantages of cheap labour and inexpensive living are disappearing, and, on the whole, there seems to be little doubt that though great manufacturing successes lie before her, she will take many years to realize them.

Japan's great difficulty is want of capital. The capital actually engaged in public and private enterprises is 60 million pounds sterling in round numbers, and 79 millions more are pledged though not yet paid up. On the other hand, the volume of circulating media is only 25 millions, of which amount 22 millions consist of convertible notes; the deposits in the banks total 33 millions, and their capitals aggregate 49½ millions.[3] In such circumstances the rate of interest is necessarily high—it averages about 12 per cent. throughout the empire—and many profitable enterprises remain undeveloped. Recourse to cheap foreign capital would be the natural solution of the difficulty. But so long as her currency was on a silver basis Japan hesitated to contract gold debts, and European capitalists would not lend in terms of silver. After she had adopted the gold standard her situation appeared more favourable. Europe and America, however, had still not acquired confidence in her finances or her integrity, and in the meanwhile a great opening for foreign capital vainly offered in the field of industrial enterprises. Recent returns issued

[1] The railways and posts constitute additional examples. The Japanese have long been able to survey, plan, and build their own lines of railways, to run the trains and to manage the traffic. For these achievements they deserve much credit. But their arrangements for handling, forwarding, and delivering goods are very defective, when judged by good Occidental standards, and their provision for the comfort of passengers leaves a great deal to be desired. So, too, their postal service invites criticism in some very important respects, if it merits praise in others. All such defects would soon be corrected if free recourse were had to the assistance of foreign experts, who have the advantage of familiarity with higher standards. It is unfortunate that a people so liberal in their adoption of the best products of Western civilization should hesitate to avail themselves of the best means of learning to utilize them.

[2] Another serious obstacle to the industrial development of the Japanese is their difficulty in deciphering foreign tastes. It results that in fields where their capacity is highest their success is often smallest. They export some two millions of umbrellas at a cost of 10½d. apiece, 30,000 pairs of boots at 11¼d. a pair, and 190,000 dozen pairs of socks at 1s. 3d a dozen. There can be no mistake about the shape and style of these things; a pattern alone suffices for guide. But, on the other hand, take the case of lacquer. In the quality and beauty of their lacquer the Japanese stand easily at the head of all nations. There, if anywhere, they should be able to defy rivalry. Yet what are the facts? Japanese lacquer experts, in their attempts to capture the New York market, have been distanced by Germans, who gauge the taste of the Americans with much greater accuracy, and produce lacquers better appreciated and cheaper than those of the Japanese themselves. Not finer lacquer, indeed, nor anything like as fine, but better suited to the immediate purpose of its manufacturers. Another case in point is the work of the silversmith. As chisellers of metal the Japanese have no superiors. Their skill in that line ought to open a wide and profitable field in Europe and America. But it does not. With the exception of a few fancy articles, objects of art rather than of utility, they sell nothing abroad. They have not yet found the range of Occidental taste, and, judging from past experience, it seems likely that they will continue to waste their strength for a long time upon unfruitful essays. It would appear, in short, that intercourse and interchange of ideas between the East and West must become much closer and less superficial before Japanese manufacturers can adapt themselves to the requirements of the Occident sufficiently to be formidable competitors. In such staples as cotton yarns, textile fabrics, silk handkerchiefs, lucifer matches, boots, umbrellas, and so forth, they find easy guidance, but where independent judgment and the mercantile instinct are needed, they still show themselves backward.

[3] The efficiency of money has greatly increased, of course, during recent years. Thus, whereas in 1873 there were only half-a-dozen banks with a total capital of £6000, and aggregate loans of the same amount, approximately, the number at the close of 1899 was 2296, with a total capital of 49½ millions sterling and loans aggregating 267 millions. In 1873 the sums deposited by individuals in banks amounted to half a million; in 1899 they aggregated 33 millions. In 1887, the year after the establishment of Clearing Houses in Tôkyô and Osaka, the clearances aggregated less than 3 millions sterling; in 1899 they totalled over 129 millions.

by 68 joint-stock companies show that they paid an average annual dividend of $16\frac{1}{2}$ per cent., and it is not to be doubted but that still better results could be attained were foreign business experience and cheap capital available.

Status of foreigners.

It has always been considered expedient, and certainly it is wise, that the subjects and citizens of Occidental Christian states, when visiting or inhabiting Oriental countries which are not Christian, should be exempted from the penalties and procedure prescribed by the criminal law of the latter; that they should continue, in short, to enjoy, even within the territories of such countries, the privilege of being arraigned before tribunals of their own nationality and tried by judges of their own race. In civil cases a division of jurisdiction is arranged, the question being always adjudicated by a tribunal of the defendant's nationality, but in criminal cases jurisdiction is wholly reserved. In pursuance of that principle the various Powers having treaties with Oriental nations establish consular courts within the latter's borders, and the jurisdiction exercised by these courts is called "extra-territorial," to distinguish it from the jurisdiction exercised by native or territorial tribunals. The system was applied to Japan's case, as a matter of course, in 1858. It had been similarly applied in the 16th century, in the days of her first foreign intercourse, and just as it had then been a cause of the Dutch traders' imprisonment within the narrow limits of the island of Deshima at Nagasaki, so in the 19th century it necessitated the confinement of the foreign residents in settlements grouped around the sites of their consular courts; for the plainest principles of prudence forbade that these residents should have free access to provincial districts far remote from the only tribunals competent to control them. The Japanese negotiators in Yedo raised no objection to the embodiment of this system in the treaties. But it was one of the features most vehemently condemned by the conservative statesmen and politicians in Kyôtô, and no sooner had the administration been restored to the Emperor than an embassy was despatched to Europe and America with the object of inducing Occidental Governments to revise the treaties, in the sense of abolishing consular jurisdiction and changing the tariff so as to enable Japan to obtain a larger revenue from customs duties.[1] This embassy sailed in 1871. It had a specific right to raise the question, for the treaties contained a provision declaring them to be subject to revision in that year. As a matter of course the embassy failed. The conditions originally necessitating consular jurisdiction had not undergone any change justifying its abolition. Neither the character of Japan's laws nor the methods of her judicial procedure were such as to warrant foreign Governments in entrusting to her care the lives and properties of their subjects and citizens. It must be confessed, on the other hand, that the consular courts themselves were not beyond reproach. A few of the Powers, notably Great Britain and the United States, had organized competent tribunals and appointed expert judicial officials to preside over them. But a majority of the Treaty States were content to delegate consular duties to merchants, who not only lacked legal training of any kind, but were themselves engaged in the commercial transactions upon which they might at any moment be required to adjudicate in a magisterial capacity. Thus it happened, sometimes, that a Japanese subject desiring to invoke the aid of the law against a foreigner who seemed to have wronged him, found that the defendant in the case would also be the judge. In any circumstances the dual functions of consul and judge could not be discharged by the same official without anomaly, for his *rôle* of consul compelled him to act as advocate in the initiatory stages of complications about which in the position of judge he might ultimately be required to deliver an impartial verdict. It would be an error to suppose, however, that the course of consular jurisdiction in Japan was disfigured by many abuses. On the whole the system worked satisfactorily, and if it hurt patriotic Japanese, it also saved them from innumerable complications into which they would have blundered inevitably had they been entrusted with a jurisdiction which they were not prepared to exercise satisfactorily.

Nevertheless, they determined from the first that no effort should be spared to qualify for the exercise of a right which is among the fundamental attributes of every sovereign state—the right of judicial autonomy. In any circumstances the recasting of their laws and the reorganization of their law courts would have occupied a prominent place in the programme of general reform suggested by contact with the Western world, but the "extra-territorial" question certainly stirred them to special legislative efforts. With the aid of foreign experts they set themselves to elaborate codes of criminal and civil law, excerpting the best features of European jurisprudence, and adapting them to the conditions and usages of Japan. They also remodelled their law courts, and took steps, slower but not less earnest, to educate a judiciary competent to administer the new codes. After twelve years devoted with partial success to these great works, Japan in 1883 renewed her request for the abolition of consular jurisdiction. She asked that all foreigners within her borders, without distinction of nationality, should be subject to her laws and judiciable by her law courts, as foreigners found within the borders of every sovereign state in the Occident were subject to its laws and judiciable by its tribunals of justice, and she supplemented her application by promising that its favourable reception should be followed by complete opening of the country and the removal of all restrictions hitherto imposed on foreign trade, travel, and residence in her realm. From the first it had been the habit of Occidental peoples to upbraid Japan on account of the barriers opposed by her to full and free foreign intercourse, and she was now able to claim that the barriers were no longer created by her intention or maintained by her desire, but that they existed because of a system which theoretically proclaimed her unfitness for free association with Western nations, and practically made it impossible for her to throw open her territories completely for the ingress of strangers.

Negotiations for treaty revision.

A portly volume might be filled with the details of the negotiations that followed Japan's proposal. Never before had an Oriental state sought such recognition, and there was extreme reluctance on the part of Western Powers to try the unprecedented experiment of entrusting the lives and property of their subjects and citizens to the keeping of a "pagan" people. Even the outlines of the story cannot be sketched here, though it abounds with diplomatic curiosities, and though several of its incidents do as much credit to Japan's patience and tact as its issue does to the justice and liberality of Occidental Governments. There is, however, one page of the history that calls for brief notice, since it supplies a key to much which would otherwise be inexplicable. The respect entertained by a nation for its own laws and the confidence it reposes in their administrators are in direct proportion to the efforts it has expended upon the development of the former and the education of the latter. Foreigners residing in Japan

[1] The tariff was fixed originally on a basis of 10 per cent. duty on imports, but in 1865 Japan consented, under heavy pressure and even armed menace, to reduce the rate to 5 per cent. This, too, was only nominal, for the conversion of *ad valorem* duties into specific was managed in such a manner that the sum actually levied on imports did not average as much as $2\frac{1}{4}$ per cent. of their value at the port of shipment.

naturally clung to consular jurisdiction as a privilege of inestimable value. They saw, indeed, that such a system could not be permanently imposed on a country where the conditions justifying it had nominally disappeared. But they saw, also, that the legal and judicial reforms effected by Japan had been crowded into an extraordinarily brief period, and that, as tyros experimenting with alien systems, the Japanese might be betrayed into many errors. A struggle thus ensued between foreign distrust on the one side and Japanese aspirations on the other—a struggle often developing painful phases. For whereas the case for the foreign resident stood solid and rational so long as it rested on the basis of his proper attachment to the laws and the judiciary which the efforts of his countrymen through long generations had rendered worthy of trust and reverence, and on the equally intelligible and reasonable ground that he wanted convincing proofs of Japan's competence to discharge her novel functions with discretion and impartiality before submitting himself to her jurisdiction, it ceased to be a solid and rational case when its champions undertook, not merely to exaggerate the risks of trusting Japan implicitly, but also to demonstrate her radical unworthiness of any trust whatever, and to depict her under aspects so deterrent that submission to her jurisdiction assumed the character of a catastrophe. The struggle lasted eleven years, but its gist is contained in this brief statement. The foreign resident, whose affection for his own systems was measured by the struggle their evolution had cost, and whose practical instincts forbade him to take anything on trust where security of person and property was concerned, would have stood out a wholesomely conservative and justly cautious figure had not his attitude been disfigured by local journalists who, in order to justify his conservatism, allowed themselves to be betrayed into the constant *rôle* of blackening the character of Japan, and suggesting harshly prejudiced interpretations of her acts and motives. It is one thing to hesitate before entering a new house until its fitness for occupation has been ascertained: it is another thing to condemn it without trial as radically and necessarily deficient in this respect. The latter was in effect the line often taken by the noisiest opponents of Japan's claims, and, of course, no little resentment and indignation were aroused on the side of the Japanese, who, chafing against the obvious antipathies of their foreign critics, and growing constantly more impatient of the humiliation to which Japan was internationally condemned, were sometimes prompted to displays of resentment which became new weapons in the hands of their critics. Throughout this struggle the Government and citizens of the United States always showed conspicuous sympathy with Japanese aspirations, and it should also be recorded that, with exceptions so rare as to establish the rule, foreign tourists and publicists discussed the problem liberally and fairly, perhaps because, unlike the foreign communities resident in Japan, they had no direct interest in its solution.

At last,[1] after long years of diplomatic negotiation and public discussion, European Governments conceded the justice of Japan's demands, and it was agreed that from July 1899, subject to the previous fulfilment of certain conditions,[2] Japanese tribunals should assume jurisdiction over every person, of whatever nationality, within the confines of Japan, and the whole country should be thrown open to foreigners, the "settlements" being abolished, and all limitations upon trade, travel, and residence removed throughout the length and breadth of the realm. Great Britain took the lead in thus releasing Japan from the fetters of the old system. The initiative came from her with special grace, for the system and all its irksome consequences had been imposed on Japan originally by a combination of Powers with Great Britain in the van. As a matter of historical sequence the United States dictated the terms of the first treaty providing for consular jurisdiction. But from a very early period the Washington Government showed its willingness to remove all limitations of Japan's sovereignty, whereas Europe, headed by Great Britain, whose preponderating interests entitled her to lead, resolutely refused to make any substantial concession. In Japanese eyes, therefore, British conservatism seemed to be the one serious obstacle, and since the British residents in the settlements far outnumbered all other nationalities, and since they alone had newspaper organs to ventilate their grievances, and exhibited all a Briton's proverbial indifference to the suavities and courtesies of speech and method that count for so much in disarming resentment, it was certainly fortunate for the popularity of her people in the Far East that Great Britain saw her way finally to set a liberal example. Nearly five years were required to bring the other Occidental Powers into line with Great Britain and America. It should be stated, however, that neither reluctance to make the necessary concessions nor want of sympathy with Japan caused the delay. The explanation is that each set of negotiators sought to improve either the terms or the terminology of the treaties already concluded, and that the tariff arrangements for the different countries required elaborate discussion.

Recognition by the Powers.

Until the last of the revised treaties was ratified, voices of protest against revision continued to be vehemently raised by a large section of the foreign community in the settlements. Some were honestly apprehensive as to the issue of the experiment. Others were swayed by racial prejudice pure and simple. A few had fallen into an incurable habit of grumbling, or found their account in professing to champion foreign interests; and all were naturally reluctant to forfeit the immunity from taxation hitherto enjoyed. It seemed as though the inauguration of the new system would find the foreign community in a mood which must greatly diminish the chances of a happy result, for where a captious and aggrieved disposition exists, opportunities to discover causes of complaint cannot be wanting. But at the eleventh hour this unfavourable demeanour underwent a marked change. So soon as it became evident that the old system was hopelessly doomed, the sound common-sense of the European and American business man asserted itself. The foreign residents let it be

[1] It would be incorrect to suppose that the responsibility for the delay can be thrown entirely on the foreign side. More than once an agreement had reached the verge of conclusion, when Japanese public opinion, partly incited by political intrigues, rebelled vehemently against the guarantees demanded of Japan, and the negotiations were interrupted in consequence, not to be again resumed until a considerable interval had elapsed. This point will easily be understood when we say that whereas, at the outset of the discussion, Japanese officialdom had the matter entirely in its own hands, and might have settled it on any basis, however liberal to foreigners, without provoking, for the moment at all events, seriously hostile criticism on the part of the nation, there gradually grew up among the people, *pari passu* with journalistic development, with the study of international law, and with the organization of political parties, a strong sense of what an independent state has a right to expect, and thus the longer the negotiations were protracted the keener became the popular scrutiny to which they were subjected, and the greater the general reluctance to endorse any irksome concessions. Had foreign diplomacy recognized the growth of that sentiment, and been content to take moderate advantage of the Japanese negotiator's mood, the issue might have been comparatively satisfactory to foreigners. But by asking too much and haggling too long, Western statesmen lost their opportunity of obtaining any substantial guarantees, and had ultimately to hand over their compatriots to Japanese jurisdiction on pure trust.

[2] The main, indeed the only notable condition was that the whole of the new Japanese codes of law must have been in operation for a period of at least one year before the abolition of consular jurisdiction.

seen that they intended to bow cheerfully to the inevitable, and that no obstacles would be willingly placed by them in the path of Japanese jurisdiction. The Japanese, on their side, took some striking steps. An Imperial rescript declared in unequivocal terms that it was the Sovereign's policy and desire to abolish all distinctions between natives and foreigners, and that by fully carrying out the friendly purpose of the treaties his people would best consult his wishes, maintain the character of the nation, and promote its prestige. The Premier and other Ministers of State issued instructions to the effect that the responsibility now devolved on the Government, and the duty on the people, of enabling foreigners to reside confidently and contentedly in every part of the country. Even the chief Buddhist prelates addressed to the priests and parishioners in their dioceses injunctions pointing out that, freedom of conscience being now guaranteed by the Constitution, men professing alien creeds must be treated as courteously as the followers of Buddhism, and must enjoy the same rights and privileges.

Thus the great change was effected in circumstances of happy augury. Its results were successful on the whole. Difficulties, it is true, were not altogether absent. The Japanese made some mistakes, and the novelty of the experiment predisposes the conservative foreigner to be hypercritical of its working. Never before since the crown of civilization was placed upon the head of the Occident had Western Christians passed under the jurisdiction of Oriental "pagans." This unprecedented act of trust on the part of Occidental Governments did not signify a corresponding access of confidence on the part of Occidental subjects and citizens. The average European or American approaches the contemplation of all the acts of the Japanese people in a spirit of condemnation or condescension, and considers that he practises praiseworthy self-denial when he pays to Japanese laws or their guardians even a moiety of the deference that he would intuitively render in similar circumstances in a Western country. Administration can never achieve more than a success of sufferance when the ruled stand upon a plane higher than that conceded to the rulers. But it has been shown, at all events, that the measure of tolerance which foreigners are prepared to display is sufficient for the working of the novel system, and that all the sinister predictions once so freely uttered about the vindictive advantage which the Japanese would certainly take of their newly-acquired power were baseless. Foreigners residing in Japan now enjoy immunity of domicile, personal and religious liberty, freedom from official interference, and security of life and property as fully as though they were living in their own country.

Freedom of the Press.

No sooner did the Diet commence its sittings in 1891 than a Bill was introduced for removing all restrictions upon freedom of speech. Already (1887) the Government had voluntarily made a great step in advance by divesting itself of the right to imprison or fine editors by executive order. But it reserved the power of suppressing or suspending a newspaper, and against that reservation a majority of the Lower House voted, session after session, only to see the Bill rejected by the peers, who shared the Government's opinion that to grant a larger measure of liberty would certainly encourage license. Not until 1897 was this opposition overcome. A new law, passed by both Houses and confirmed by the Emperor, took from the executive all power over journals, except in cases of lese-majesty, and nothing now remains of the former arbitrary system. The result has falsified all sinister forebodings. A much more moderate tone pervades the writings of the Press since restrictions were entirely removed, and although there are now 829 journals and periodicals published throughout the empire, with a total annual circulation of 463 million copies, intemperance such as in former times would have provoked official interference is practically unknown to-day.

The quality of journalistic writing in Japan is marred by extreme and pedantic classicism. There has not yet been any real escape from the trammels of a tradition which assigned the crown of scholarship to whatever author drew most largely upon the resources of the Chinese language. A pernicious example in this respect is set by the Imperial court. The Sovereign, whether he speaks by rescript or by edict, never addresses the bulk of his subjects. His words are taken from sources so classical as to be intelligible only to the highly-educated minority. Several of the newspapers affect a similar style. They sacrifice their audience to their erudition, and prefer classicism to circulation. Their columns are a sealed book to the whole of the lower middle classes and to the entire female population. Others, taking a more rational view of the purposes of journalism, aim with success at simplicity and intelligibility, and thus not only reach an extended circle of readers, but also are hastening incidentally the advent of a great reform, the assimilation of the written and spoken languages, which will probably prelude that still greater desideratum, abolition of the ideographic script. Apart from this pedantic defect, the best Japanese editors have caught with remarkable aptitude the spirit of modern journalism. But a few years ago they used to compile laborious essays, in which the construction was involved, the ideas were trivial, the inspiration was drawn from Occidental text-books, and the alien character of the source was hidden under a veneer of Chinese aphorisms. To-day they write terse, succinct, closely-reasoned articles, seldom diffuse, often witty, and generally free from extravagance of thought or diction. Yet, with few exceptions, the profession of journalism is not remunerative. Very low rates of subscription, and almost prohibitory high charges for advertising, are chiefly to blame.[1] The vicissitudes of the enterprise may be gathered from the facts that whereas 2767 journals and periodicals were started between 1889 and 1894 (inclusive), no less than 2465 ceased publishing. The largest circulation recorded in 1901 was about 30,000 copies daily.

Foreign wars.

Since the abolition of feudalism Japan has been engaged in three over-sea wars. The first, in 1874, was an expedition to Formosa. This has already been spoken of. It was insignificant from a military point of view, but it derived vicarious interest from its effect upon the relations between China and Japan, and upon the question of the ownership of the Riukiu Islands. These islands, which lie at a little distance south of Japan, had for centuries been regarded as an appanage of the Satsuma fief. The language and customs of their inhabitants showed unmistakable traces of relationship to the Japanese, and the possibility of the islands being included among the dominions of China had probably never occurred to any Japanese statesman. When, therefore, in 1873, the crew of a wrecked Riukiuan junk were barbarously treated by the inhabitants of northern Formosa, the Japanese Government unhesitatingly assumed the responsibility of seeking redress for this outrage. Formosa being a part of the Chinese empire, complaint was duly preferred in Peking. But the Chinese authorities showed such resolute indifference to Japan's representations that she finally took the law into her own hands, and sent a small force to

[1] The highest rate of subscription to a daily journal is twelve shillings per annum, and the usual charge for advertisements is from 7d. to one shilling per line of 22 ideographs (about nine words).

punish the Formosan murderers, who, of course, were found quite unable to offer any serious resistance. The Chinese Government, now recognizing the fact that its territories had been invaded, lodged a protest which threatened for a moment to involve the two empires in war, and might not have been amicably settled but for the intervention of the British minister in Peking. The final terms of arrangement were that, in consideration of Japan's withdrawing her troops from Formosa, China should indemnify her to the extent of half a million dollars (about £100,000) on account of the expenses of the expedition.

The Riukiu question.

Had Japan needed any confirmation of her belief that the Riukiu Islands belonged to her, this incident would have furnished it. Thus, in 1876, she did not hesitate to extend her newly organized system of prefectural government to Riukiu, which thenceforth became "Okinawa Prefecture," the former ruler of the islands being pensioned, according to the system followed in the case of the feudal chiefs in Japan proper. China entered an objection immediately. She claimed that Riukiu had always been a tributary of the Middle Kingdom, and she was doubtless perfectly sincere in the contention. But China's interpretation of tribute did not seem reducible to a working theory. So long as her own advantage could be promoted, she regarded as a token of vassalage the presents periodically carried to her court from neighbouring states. But so soon as there arose any question of discharging a suzerain's duties, she classed those offerings as insignificant interchanges of neighbourly courtesy. It was true that Riukiu had followed the custom of despatching gift-bearing envoys to China from time to time, just as Japan herself had done, though with less regularity. But it was also true that Riukiu had been subdued by Satsuma without China's stretching out a hand to help her; that for two centuries the islands had been included in the Satsuma fief, and that China had recently made a practical acknowledgment of Japan's superior title to protect the islanders. Each empire asserted its claims positively; but whereas Japan put hers into practice, China confined herself to remonstrances. Things remained in that state until 1880, when General Grant, visiting the East, suggested the advisability of a compromise. A conference met in Peking, and the plenipotentiaries agreed that the islands should be divided, Japan taking the northern group, China the southern. But on the eve of signature the Chinese plenipotentiary drew back, pleading that he had no authority to conclude an agreement without previously referring it to certain other dignitaries. Japan, sensible that she had been flouted, withdrew from the discussion and retained the islands, China's share in them being reduced to a grievance.

The Korean question.

From time immemorial China's policy towards the petty states on her frontiers had been to utilize them as buffers for softening the shock of foreign contact, while contriving, at the same time, that her relations with them should involve no inconvenient responsibilities to herself. The aggressive impulses of the outside world were to be checked by an unproclaimed understanding that the territories of these states partook of the inviolability of the Middle Kingdom itself, while the states, on their side, must never expect their suzerain to bear the consequences of their acts. This arrangement, depending largely on sentiment and prestige, retained its validity in the atmosphere of Oriental seclusion, but quickly failed to endure the test of modern Occidental practicality. Tongking, Annam, Siam, and Burma were withdrawn, one by one, from the circle of buffers and from the fiction of dependence on China and independence towards all other countries. But with regard to Korea, China proved more tenacious. The possession of the peninsula by a foreign Power would have threatened the maritime route to the Chinese capital and given easy access to Manchuria, the cradle of the dynasty which ruled China. Therefore Peking statesmen endeavoured to preserve the old-time relations with the little kingdom. But they never could persuade themselves to modify the indirect methods sanctioned by tradition. Instead of boldly declaring the peninsula a dependency of the Middle Kingdom, they sought to keep up the romance of ultimate dependency and intermediate sovereignty. Thus, in 1876, Korea was suffered to conclude with Japan a treaty of which the first article declared her "an independent state enjoying the same rights as Japan," and subsequently to make with the United States (1882), Great Britain (1883), and other Powers, treaties in which her independence was constructively admitted. China, however, did not intend that Korea should exercise the independence thus conventionally recognized. A Chinese Resident was placed in Seoul, and a system of steady though covert interference in Korea's domestic and foreign affairs was inaugurated. The chief sufferer from these anomalous conditions was Japan. In all her dealings with Korea, in all complications that arose out of her comparatively large trade with the peninsula, in all questions connected with her numerous settlers there, she found herself negotiating with a dependency of China, and with officials who took their orders from the Chinese representative. China had long entertained a rooted apprehension of Japanese aggression in the peninsula—an apprehension not unwarranted by history—and that distrust tinged all the influence exerted by her agents there. Much space would be required to recapitulate the occasions upon which Japan was made sensible of the discrimination thus exercised against her. Little by little the consciousness roused her indignation, and although no single instance constituted a ground for strong international protest, the Japanese people gradually acquired a consciousness of being perpetually baffled, thwarted, and humiliated by China's interference in the peninsular kingdom's affairs. To appreciate the bitterness of such conditions, it has to be remembered that for the previous thirty years China had treated Japan as a contemptible deserter from the Oriental standard, and had regarded her progressive efforts with openly disdainful aversion; while Japan, on her side, had chafed more and more to furnish some striking evidence of the wisdom of her preference for Western civilization. In the breast of each nation there had been smouldering a sentiment of umbrage which could scarcely fail to be translated into hostile action sooner or later, unless either Japan reverted to conservatism or China became progressive. Even more serious were the consequences of Chinese interference when considered from the point of view of Korean administration. The rulers of the country lost all sense of national responsibility, and gave unrestrained sway to selfish ambition. The functions of the judiciary and of the executive alike came to be discharged by bribery only. Family interests predominated over those of the State. Taxes were imposed in proportion to the greed of local officials. No thought whatever was taken for the welfare of the people or for the development of the country's resources. Among the upper classes faction struggles, among the lower, insurrections, began to be more and more frequent. Personal responsibility was unknown among officials, family influence overshadowing everything. To be a member of the Bin family, to which the queen belonged, was to possess a passport to office and an indemnity against the consequences of abuse of power, however flagrant. From time to time the advocates of progress or the victims of oppression rose in arms. They effected nothing except to recall to the world's

recollection the miserable condition into which the peninsula had fallen. Chinese military aid was always furnished readily for the suppression of these *émeutes*, and thus the Bin family learned to base its tenure of power on ability to conciliate the Middle Kingdom, and on readiness to obey Chinese dictation, while the people at large fell into the apathetic condition of men that possess neither the blessing of security of property nor the incentive of national ambition.

As a matter of State policy the Korean problem caused much anxiety to Japan. Her own security being deeply concerned in preserving Korea from the grasp of a Western Power, she could not suffer the little kingdom to drift into a condition of such administrative incompetence and national debility that a strong aggressor might find at any moment a pretext for interference. On two occasions, namely, in 1882 and 1884, when China's armed intervention was employed in the interests of the Bin to suppress movements of reform, the partisans of the victors, regarding Japan as the fountain of progressive tendencies, attacked and destroyed her legation in Seoul and compelled its inmates to fly from the city. Japan behaved with forbearance at these crises, but in the consequent negotiations she acquired conventional titles that touched the core of China's alleged suzerainty. For in 1882 her right to maintain troops in Seoul for the protection of her legation was admitted, and in 1885 she concluded with China a convention by which each Power pledged itself not to send troops to the peninsula without notifying the other, the two empires being thus placed on an equal military footing with regard to the peninsular kingdom.

The rupture with China.

In the spring of 1894 a serious insurrection broke out in Korea, and the insurgents proving themselves superior to the ill-disciplined, ill-equipped troops of the Government, the Bin family had recourse to its familiar expedient, appeal to China's aid. The appeal elicited a prompt response. On the 6th of July 2500 Chinese troops embarked at Tientsin and were transported to the peninsula, where they went into camp at Ya-shan, on the south-west coast, notice of the measure being given by the Chinese Government to the Japanese representative at Peking, according to treaty. During the interval immediately preceding these events, Japan had been rendered acutely sensible of China's arbitrary and unfriendly interference in the peninsula. Twice the efforts of the Japanese Government to obtain redress for unlawful and ruinous trade prohibitions issued by the Korean authorities had been thwarted by the action of the Chinese representative in Seoul; and once an ultimatum addressed from Tôkyô to the Korean Government, as the sequel of long and vexatious delay, had elicited from the Viceroy Li in Tientsin an insolent threat of Chinese armed opposition. Still more strikingly provocative of national indignation was China's procedure with regard to the murder of Kim Ok-kyün, the leader of progress in Korea, who had been for some years a refugee in Japan. Inveigled from Japan to China by fellow-countrymen sent from Seoul to assassinate him, Kim was shot in a Japanese hotel in Shanghai; and China, instead of punishing the murderer, conveyed him, together with the corpse of his victim, in a warship of her own to Korea, the assassin to be publicly honoured, the body to be savagely mutilated. When, therefore, the insurrection of 1894 in Korea induced the Bin family again to solicit China's armed intervention, the Tôkyô Government concluded that, in the interests of Japan's security and of civilization in the Orient, steps must be taken to put an end finally to the barbarous corruption and misrule which rendered Korea a scene of constant disturbance, offered incessant invitations to foreign aggression, and checked the country's capacity to maintain its own independence. Japan did not claim for herself any rights or interests in the peninsula superior to those possessed there by China. She was always ready to work hand in hand with the Middle Kingdom in inaugurating and carrying out a system of reform. But there was not the remotest probability that China, whose face had been contemptuously set against all the progressive measures adopted by Japan during the preceding twenty-five years, would join in forcing upon a neighbouring kingdom the very reforms she herself despised and abhorred, were her co-operation invited through ordinary diplomatic channels only. It was necessary to contrive a situation which would not only furnish clear proof of Japan's resolution, but also enable her to pursue her programme independently of Chinese endorsement, should the latter be finally unobtainable. She therefore met China's notice of a despatch of troops with a corresponding notice of her own, and the month of July 1894 found a Chinese force assembled at Ya-shan and a Japanese force occupying positions in the neighbourhood of Seoul. China's motive for sending troops was nominally to quell the Tonghak insurrection, but really to reaffirm her own domination in the peninsula, and to reseat in the administrative saddle men under whose guidance the country was losing all capacity for independence. Japan's motive was to secure a position such as would enable her to insist upon the radically curative treatment of Korea's malady. Up to this point the two empires were strictly within their conventional rights. Each was entitled by treaty to send troops to the peninsula, provided that notice was given to the other. But China, in giving notice, described Korea as her "tributary state," thus thrusting into the forefront of the discussion a contention which Japan, from conciliatory motives, would have kept out of sight. Once formally advanced, however, the claim had to be challenged. In the treaty of amity and commerce concluded many years previously between Japan and Korea, the two high contracting parties were explicitly declared to possess the same national status. Japan could not agree that a Power which for two decades she had acknowledged and treated as her equal should be openly classed as a tributary of the Middle Kingdom. She protested, but the Chinese statesmen took no notice of her protest. They continued to apply the disputed appellation to Korea, and they further asserted their assumption of sovereignty in the peninsula by seeking to set limits to the number of troops sent by Japan, as well as to the sphere of their employment. Japan then proposed that the two empires should unite their efforts for the suppression of the disturbances in Korea, and for the subsequent improvement of that kingdom's administration, the latter purpose to be pursued by the despatch of a joint commission of investigation. That was an important stage in the dispute. It rested then with China to avert all danger of war by joining hands with Japan for the regeneration of a nation in whose prosperity and independence the two empires were equally interested. But she refused everything. Ready at all times to interfere by force of arms between the Korean people and the dominant political faction, she declined to interfere in any way for the promotion of reform. Ready at all times to crush the little kingdom into submission to a corrupt and demoralizing administration, she refused to aid in rescuing it from the suffering and enervation entailed by the sway of such an oligarchy. She even expressed superciliously an insolent surprise that Japan, while asserting Korea's independence, should suggest the idea of peremptorily reforming its administration. In short, for Chinese purposes the Peking statesmen openly declared Korea a tributary of the Middle Kingdom, and denied Japan's assertion of its independence; but for Japanese purposes

they insisted that it must be held independent, and that Japan must abide strictly by her assertion of its independence. The Tôkyô cabinet now declared their resolve not to withdraw the Japanese troops without "some understanding that would guarantee the future peace, order, and good government of Korea," and since China still declined to come to such an understanding, Japan undertook the work of reform single-handed.

The Chinese representative in Seoul threw the whole weight of his influence into the scale against the success of these reforms. Still, nothing immediately occurred to drive the two empires into open warfare. The determining cause of rupture was in itself a belligerent operation. China's troops, as already stated, had been sent originally for the purpose of quelling the Tonghak rebellion. But the rebellion having died of inanition before the landing of the troops, their services were not required or employed. Nevertheless they were not withdrawn. China kept them in the peninsula, her declared reason for doing so being the presence of a Japanese military force. Thus, throughout the subsequent negotiations the Chinese forces lay in an entrenched camp at Ya-shan, while the Japanese occupied Seoul. The trend of events did not import any character of direct mutual hostility to these little armies. But when it became evident that all hope of friendly co-operation between the two empires must be abandoned, and when Japan, single-handed, had embarked upon her scheme of regenerating Korea, not only did the continued presence of a Chinese military force in the peninsula assume special significance, but any attempt on China's part to send reinforcements could be construed in one sense only, namely, as an unequivocal declaration of resolve to oppose Japan's proceedings by force of arms. Seeing, then, that China was preparing to send reinforcements, Japan warned the Peking Government of the construction she must place upon any act of the kind. Nevertheless China not only despatched troops by sea to strengthen the camp at Ya-shan, but also sent an army overland across Korea's northern frontier. It was at this stage that an act of war occurred. Three Chinese men-of-war, convoying a transport with 1200 men, encountered and fired on three Japanese cruisers. One of the Chinese ships was taken; another was so shattered that she had to be beached and abandoned; the third escaped in a dilapidated condition, and the transport, refusing to surrender, was sunk. This happened on 25th July, and an open declaration of war was made by each empire six days later.

The narrative set down above represents the last chapter only of a history having its beginnings a quarter of a century earlier. From the moment that Japan applied herself to break away from Oriental traditions, and to tear from her limbs the fetters of Eastern conservatism, it was inevitable that a widening gulf should gradually grow between herself and China, the inveterate representative of those traditions and that conservatism. Thus the struggle that occurred in 1894 was rather a contest between Japanese progress and Chinese stagnation than a fight to determine China's suzerainty or Korea's independence. To secure Korean immunity from foreign—especially Russian—aggression was of capital importance to both empires. Japan believed that such security could be attained by introducing into the peninsula the civilization which had contributed so signally to the development of her own strength and resources. China thought that she could guarantee it without any departure from old-fashioned methods, and by the same process of capricious protection which had failed so signally in the cases of Annam, Tongking, Burma, and Siam. The issue really at stake was whether Japan should be suffered to act as the Eastern propagandist of Western progress, or whether her efforts in that cause should be held in check by Chinese conservatism.

Events of the war.

The war itself was a succession of triumphs for Japan. Four days after the first naval encounter she sent from Seoul a column of troops who attacked the Chinese entrenched at Ya-shan and routed them without difficulty. Many of the fugitives effected their escape to Phyong-yang, a town on the Tai-dong river, offering excellent facilities for defence, and historically interesting as the place where a Japanese army of invasion had been defeated by Chinese and Korean troops at the close of the 16th century. There the Chinese assembled a force of 17,000 men, and made full preparations for a decisive contest. They had ample leisure. A period of forty days elapsed before the Japanese columns, one moving due north from Seoul, the other striking west from Yuen-san, converged upon Phyong-yang, and that interval was utilized by the Chinese to throw up parapets, mount Krupp guns, and otherwise strengthen their position. Moreover, they were armed with repeating rifles, whereas the Japanese had only single-shooters, and the ground offered little cover for an attacking force. In such circumstances, the advantages possessed by the defence ought to have been well-nigh insuperable; yet a day's fighting sufficed to carry all the positions, the assailants' casualties amounting to less than 700, and the defenders losing 6000 in killed and wounded. It was a brilliant victory, and it proved to be the prelude of another equally conspicuous success at sea. For on the 17th September, the very day after the battle at Phyong-yang, a great naval fight took place near the mouth of the Yalu river, which forms the northern boundary of Korea. Fourteen Chinese warships and six torpedo-boats were returning to home ports after convoying a fleet of transports to the Yalu, when they encountered eleven Japanese men-of-war cruising in the Yellow Sea. Hitherto the Chinese had sedulously avoided a contest at sea. Their fleet was the stronger, since it included two armoured line-of-battle ships of over 7000 tons displacement, whereas the biggest vessels on the Japanese side were belted cruisers of only 4000 tons. In the hands of an admiral appreciating the value of sea power, China's naval force would certainly have been led against Japan's maritime communications, for a successful blow struck there must have put an end to the Korean campaign. History had already demonstrated that fact, for on two occasions in former ages attempts made by Japan to conquer the peninsula were rendered abortive by the superior maritime strength of the Koreans and Chinese. On land her soldiers proved invincible, but her sea-route being severed, she had to abandon the enterprise. The Chinese, however, failed to read history. They employed their war-vessels as convoys only, and when not using them for that purpose, hid them in port. Everything goes to show that they would have avoided the battle off the Yalu had choice been possible, though when forced to fight they fought bravely. Four of their ships were sunk, and the remainder escaped to Wei-hai-wei, the vigour of the Japanese pursuit being greatly impaired by the presence of torpedo-boats in the retreating squadron.

The Yalu victory opened the over-sea route to China. Japan could now strike at Talienwan, Port Arthur, and Wei-hai-wei, naval stations on the Liaotung and Shantung peninsulas, where the powerful permanent fortifications, built after plans prepared by European experts and armed with the best modern weapons, were regarded as almost impregnable. They fell before the assaults of the Japanese troops as easily as the comparatively

rude fortifications at Phyong-yang had fallen. The only resistance of a stubborn character was made by the Chinese fleet at Wei-hai-wei; but after the whole squadron of torpedo-craft had been destroyed or captured as they attempted to escape, and after three of the largest vessels had been sunk at their moorings by Japanese torpedoes, and one by shot and shell, the remaining four ships and five gunboats surrendered, and their brave commander, Admiral Ting, committed suicide. This ended the war. It had lasted seven and a half months, during which time Japan put into the field five columns, aggregating about 120,000 of all arms. One of these columns marched northwards from Seoul, won the battle of Phyong-yang, advanced to the Yalu, forced its way into Manchuria, and moved towards Mukden *viâ* Feng-hwan, fighting several minor engagements, and conducting the greater part of its operations amid deep snow in mid-winter. The second column diverged westwards from the Yalu, and, marching through southern Manchuria, reached Hai-cheng, whence it advanced to the capture of Newchwang and Ying-kow. The third landed on the Liaotung peninsula, and, turning southwards, carried Talienwan and Port Arthur by assault. The fourth moved up the Liaotung peninsula, and, having seized Kaiping, advanced against Ying-kow, where it joined hands with the second column. The fifth crossed from Port Arthur to Wei-hai-wei, and captured the latter. In all these operations the total Japanese casualties were 1005 killed and 4922 wounded —figures which sufficiently indicate the inefficiency of the Chinese fighting. The deaths from disease totalled 16,866, and the total monetary expenditure was £20,000,000 sterling.

The Chinese Government sent Li Hung-chang, Viceroy of Pechili and senior Grand Secretary of State, and Li Ching-fong, to discuss terms of peace with Japan, the latter being represented by Marquis Ito and Count Mutsu, Prime Minister and Minister for Foreign Affairs respectively. A treaty was signed at Shimonoseki on the 17th of April 1895, and subsequently ratified by the Sovereigns of the two empires. It declared the absolute independence of Korea; ceded to Japan the part of Manchuria lying south of a line drawn from the mouth of the river Anping to the mouth of the Liao, *viâ* Feng-hwan, Hai-cheng, and Ying-kow, as well as the islands of Formosa and the Pescadores; pledged China to pay an indemnity of 200,000,000 taels; provided for the occupation of Wei-hai-wei by Japan pending payment of the indemnity; secured some additional commercial privileges, as the opening of four new places to foreign trade, and the right of foreigners to engage in manufacturing enterprises in China, and provided for the conclusion of a treaty of commerce and amity between the two empires, based on the lines of China's treaties with Occidental Powers.

Foreign interference.

No sooner did this agreement receive ratification at the hands of the Sovereigns of Japan and China, than three of the great European Powers—Russia, Germany, and France—stepped forward, and presented a joint note to the Tôkyô Government, recommending that the territories ceded to Japan on the mainland of China should not be permanently occupied, as such a proceeding would be detrimental to the lasting peace of the Orient. The recommendation was couched in the usual terms of diplomatic courtesy, but everything indicated that its signatories were prepared to enforce their advice by an appeal to arms. Japan found herself compelled to comply. Exhausted by the Chinese campaign, which had drained her treasury, consumed her supplies of warlike material, and kept her squadrons constantly at sea for eight months, she had no residue of strength to oppose such a coalition. Her resolve was quickly taken. The day that saw the publication of the ratified treaty saw also the issue of an Imperial rescript in which the Mikado, avowing his unalterable devotion to the cause of peace, and recognizing that the counsel offered by the European States was prompted by the same sentiment, "yielded to the dictates of magnanimity, and accepted the advice of the three Powers." The Japanese were shocked by this incident. They could understand the motives influencing Russia and France, for it was evidently natural that the former should desire to exclude warlike and progressive people like the Japanese from territories contiguous to her borders, and it was also natural that France in the East should remain true to her alliance with Russia in the West. But Germany, wholly uninterested in the ownership of Manchuria, and by profession a warm friend of Japan, seemed to have joined in robbing the latter of the fruits of her victory simply for the sake of establishing some shadowy title to Russia's good-will. It was not known until a later period that the emperor of Germany entertained profound apprehensions about an irruption of Oriental hordes into the Occident, and held it a sacred duty to prevent Japan from gaining a position which might enable her to construct an immense military machine out of the countless millions of the Chinese nation. When his Majesty's mood came to be understood, much of the resentment provoked by his seemingly reckless unfriendliness in the Manchurian affair was softened by the mirth which his chimera excited.

Chinese crisis of 1900.

Japan's third expedition over-sea in the *Meiji* era had its origin in causes which belong to the history of China (*q.v.*). It will suffice to say here that in the second half of 1900 an anti-foreign and anti-dynastic rebellion, breaking out in Shantung, spread to the neighbouring metropolitan province of Pechili, and resulted in a situation of extreme peril for the foreign communities of Tientsin and Peking. It was impossible for any European Power, or for the United States of America, to organize sufficiently prompt measures of relief. Thus the eyes of the world turned to Japan, whose proximity to the scene of disturbance rendered intervention comparatively easy for her. But Japan hesitated. Knowing now with what suspicion and distrust the development of her resources and the growth of her military strength were regarded by some European peoples, and aware that she had been admitted to the comity of Western nations on sufferance, she shrank, on the one hand, from seeming to grasp at an opportunity for armed display, and on the other, from the solecism of obtrusiveness in the society of strangers. Not until Europe and America made it quite plain that they needed and desired her aid did she send a division (21,000 men) to Pechili. Her troops acted a fine part in the subsequent expedition for the relief of Peking, which had to be approached in mid-summer under very trying conditions. Fighting side by side with European and American soldiers, and under the eyes of competent military critics, the Japanese acquitted themselves in such a manner as to establish a high military reputation. Further, after the relief of Peking they withdrew a moiety of their forces, and that step, as well as their unequivocal co-operation with Western Powers in the subsequent negotiations, helped to show the injustice of the suspicions with which they had been regarded.

The final stage in the recognition of Japan as one of the Great Powers was accomplished in February 1902, when an offensive and defensive treaty of alliance was signed between her and Great Britain, on terms which were published to the world at large. From that moment the British and Japanese Powers were united to maintain the *status quo* in the Far East. (F. BY.)

III. The Japanese Army.

Originally the Japanese nation consisted entirely of soldiers. The Sovereign was the commander-in-chief; the *O-omi* and *Omuraji* were his lieutenants. The duty of serving in the ranks devolved on all subjects alike, the great nobles forming a patriarchal council of generals. But at the close of the 7th century of the Christian era, when the Empress Jito sat upon the throne, the social system of the Tang dynasty of China commended itself for adoption. The civil and military were then divided for the first time. Certain officers received commissions appointing them to special posts—as the generals of the left and of the right, the brigadiers of the left and of the right, the captains of the left and of the right, and so on; a war office (*hyobu-sho*) was organized, as were also cavalry departments of the left and of the right, and each important district throughout the empire had its military division (*gundan*). All having been originally soldiers, no hereditary claim to carry arms could be set up. Physical qualifications alone received consideration. One-third of the nation's able-bodied males constituted the army, and these being divided into three equal parts, one part served in the capital as palace guards, one had its headquarters in Kiushiu, forming a legion for the protection of the southern coasts against Korean raiders or for service abroad, and the third part garrisoned the provincial posts. As to tactical formation, 5 men made a section, 2 sections a company, 5 companies a battalion, 2 battalions a regiment, and 10 regiments a division. Six horses were assigned to a company, the best riders and archers being selected for cavalry duty. A division consequently consisted of 600 mounted men and 400 foot soldiers. Service was for a period only, and during that period taxes were remitted, so that military duties always found men ready to discharge them. Thus the hereditary soldier—afterwards known as the *samurai* or *bushi*—did not yet exist, nor was there any such thing as an exclusive right to carry arms. Weapons of war were the property of the State, stored away in times of peace, and served out periodically when required for fighting or for training purposes. The next stage of development had its origin in the assumption of high offices of State by great families, who encroached upon the Imperial prerogatives, and appropriated as hereditary perquisites posts which should have remained in the gift of the Sovereign. The Fujiwara clan, taking all the civil offices, resided in the capital, whereas the military posts fell to the lot of the Taira and the Minamoto, who, settling in the provinces, and being thus required to guard the outlying districts and to quell rebellions, found it expedient to surround themselves with men who made soldiering a profession. These latter, in their turn, copying the customs of their superiors, transmitted their functions to their sons, so that there grew up in the shadow of the great houses a number of military families devoted to maintaining the power and promoting the interests of their masters, from whom they derived their own privileges and emoluments. At the close of the 8th century stubborn insurrections on the part of the autochthons gave new importance to the soldier. The conscription list had to be greatly increased, and it came to be a recognized principle that every stalwart man should bear arms, every weakling become a bread-winner. Thus, for the first time, the distinction between "soldier" and "working man"[1] received official recognition, and in consequence of the circumstances attending the distinction a measure of contempt attached to the latter as compared with the former. History reveals that the continuous growth of the great provincial nobles tended to deepen this line of cleavage, so that, from the middle of the 10th century, the terms *samurai* and *bushi* acquired a special significance, being applied to themselves and their followers by the local magnates, whose power tended more and more to eclipse even that of the Throne. Finally, in the 12th century, when the Minamoto brought the whole country under the sway of military organization, the privilege of bearing arms was restricted to the *samurai*. Thenceforth the military class entered upon a period of administrative and social superiority which lasted, without serious interruption, until the middle of the 19th century. But it is to be observed that the distinction between soldier and civilian, *samurai* and commoner, was not of ancient existence, nor did it arise from any question of race or caste, victor or vanquished, as is often supposed and stated. It was an outcome wholly of ambitious usurpations, which, relying for success on force of arms, gave practical importance to the soldier, and invested his profession with factitious honour.

History.

The *bow* was always the chief weapon of the fighting-man in Japan. "War" and "bow-and-arrow" were synonymous terms. History tells how Tametomo shot an arrow through the crest of his brother's helmet, in order to recall his allegiance, without injuring him; how Nasuno Minetaka discharged a shaft that severed the stem of a fan swayed by the wind; how Mutsuru, ordered by an emperor to rescue a fish from the talons of an osprey without killing bird or fish, cut the osprey's legs with an arrow so that the fish dropped into the palace lake and the bird continued its flight; and there are many similar records of Japanese skill with the weapon. Still more suggestive and better authenticated were the feats performed at the "thirty-three-span halls" in Kyôtô and Yedo, where the archer had to shoot an arrow through the whole length of a corridor 128 yards long and only 16 feet high. Wada Daihachi, in the 17th century, succeeded in sending 8133 arrows from end to end of the corridor in 24 consecutive hours, being an average of over 5 shafts per minute; and Matatoki, in 1852, made 5383 successful shots in 20 hours, or more than 4 a minute. The lengths of the bow and arrow were determined with reference to the capacity of the archer. In the case of the bow, the unit of measurement was the distance between the tips of the thumb and the little finger with the hand fully stretched. Fifteen of these units gave the length of the bow, or about 7½ feet. The unit for the arrow was from 12 to 15 hand-breadths, or from 3 feet to 3¾ feet. Originally the bow was of unvarnished boxwood or zelkowa; but subsequently bamboo alone came to be employed. Binding with cord or rattan served to strengthen the bow, and for precision of flight the arrow had three feathers, an eagle's wing being most esteemed for that purpose, and after it, in order, that of the copper pheasant, the crane, the adjutant, the snipe.

Weapons.

Next in importance to the bow came the *sword*, which is often spoken of as the *samurai's* chief weapon, though there can be no doubt that during long ages it ranked after the bow. It was a single-edged weapon remarkable for its three exactly similar curves—edge, face-line, and back; its almost imperceptibly convexed blade; its admirable tempering; its beautiful and consummately skilled forging; its razor-like sharpness, and its cunning distribution of weight, giving a maximum effect of stroke. The

[1] The term (*hyaku-sho*) here translated "working man" means literally "one engaged in any of the various callings" apart from military service. In a later age a further distinction was established between the agriculturist, the artisan, and the trader, and the word *hyaku-sho* then came to carry the signification of "husbandman" only, which sense it now possesses.

10th century saw this unequalled weapon carried to completion, and it has been inferred that only from that epoch did the *samurai* begin to esteem his sword the greatest treasure he possessed, and to rely on it as his best instrument of attack and defence. But it is evident that the evolution of such a blade must have been due to an urgent, long-existing demand, and that the *katana* came as the sequel of innumerable efforts on the part of the swordsmith and generous encouragement on that of the soldier. Many pages of Japanese annals and household traditions are associated with its use. In every age numbers of men devoted their whole lives to acquiring novel skill in swordsmanship. Many of them invented systems of their own, differing from one another in some subtle details unknown to any save the master himself and his favourite pupils. Not merely the method of handling the weapon had to be studied. Associated with sword-play was an art variously known as *shinobi*, *yawara*, and *jiujutsu*, names which imply the exertion of muscular force in such a manner as to produce a maximum of effect with a minimum of effort, by directing an adversary's strength so as to become auxiliary to one's own. It was an essential element of the expert's art not only that he should be competent to defend himself with any object that happened to be within reach, but also that without an orthodox weapon he should be capable of inflicting fatal injury on an assailant, or, at any rate, of disabling him. In the many records of great swordsmen instances are related of men seizing a piece of firewood, a brazier-iron, or a druggist's pestle as a weapon of offence, while, on the other side, an umbrella, an iron fan, or even a pot-lid served for protection. In short, the *samurai* had to be prepared for every emergency. Were he caught weaponless by a number of assailants, his art of *yawara* was supposed to supply him with expedients for emerging unscathed. Nothing counted save the issue. The methods of gaining victory or the circumstances attending defeat were scarcely taken into consideration. The true *samurai* had to rise superior to all contingencies. Out of this perpetual effort on the part of hundreds of experts to discover and perfect novel developments of swordsmanship, there grew a habit which held its vogue down to modern times, namely, that when a man had mastered one style of sword-play in the school of a teacher, he set himself to study all others, and for that purpose undertook a tour throughout the provinces, fencing whenever he found an expert, and, in the event of defeat, constituting himself the victor's pupil. It may indeed be said that the sword exercised a potent influence on the life of the Japanese nation. The distinction of wearing it, the rights that it conferred, the deeds wrought with it, the fame attaching to special skill in its use, the superstitions connected with it, the incredible value set upon a fine blade, the honours bestowed on an expert sword-smith, the traditions that had grown up around celebrated weapons, the profound study needed to be a competent judge of a sword's qualities—all these things conspired to give to the *katana* an importance beyond the limits of ordinary comprehension. A *samurai* carried at least two swords, a long and a short. Their scabbards of lacquered wood were thrust into his girdle, not slung from it, being fastened in their place by cords of plaited silk. Sometimes he increased the number of swords to three, four, or even five, before going into battle, and this array was supplemented by a dagger carried in the bosom. The short sword was not employed in the actual combat. Its use was to cut off an enemy's head after overthrowing him, and it also served a defeated soldier in his last resort—suicide. In general the long sword did not measure more than 3 feet, including the hilt; but some were 5 feet long, and some were 7. Considering that the scabbard, being fastened to the girdle, had no play, the feat of drawing one of these very long swords demanded extraordinary aptitude.[1]

Spear and *halberd* were among the weapons of the ancient Japanese as well as sword and bow. The oldest form of spear was derived from China. Its handle measured about 6 feet and its blade 8 inches, and it had sickle-shaped horns at the junction of blade and hilt. This weapon served almost exclusively for guarding palisades and gates. In the 14th century a true lance came into use. Its length varied greatly, and it had a hog-backed blade tempered almost as finely as the sword itself. This, too, was a Chinese type, as was also the halberd. The term "halberd" is a defective translation of the word *naginata* (long-sword), which was really a scimitar-like blade, some 3 feet in length, fixed on a slightly longer haft. Originally the warlike monks alone employed this weapon, but from the 12th century it found much favour among military men. Ultimately, however, its use may be said to have been limited to women and priests.

Armour.

Speaking broadly, Japanese *armour* may be described as plate armour, but the essential difference between it and the Norman type was that, whereas the latter took its shape from the costume of the period, the former bore no resemblance and never was designed to bear any resemblance to ordinary garments. Hence the only changes that occurred in Japanese armour from generation to generation had their origin in improved methods of construction. In general appearance it differed from the panoply of all other nations, so that, although to its essential parts we may apply with propriety the European terms—helmet, corselet, taches, épaulières, brassart, cuissart, and greaves—individually and in combination these parts were not at all like the originals of those names. Perhaps the easiest way of describing the difference is to say that whereas a Norman knight seemed to be clad in a suit of metal clothes, a Japanese *samurai* looked as if he wore protective curtains. The Japanese armour was, in fact, suspended from, rather than fitted to, the person. It had only one element counterparted in the European suit, namely, a tabard, which, in the case of men of rank, was made of the richest brocade. Iron and leather were the chief materials, and as the laminæ were strung together with a vast number of coloured cords—silk or leather—an appearance of considerable brilliancy was produced. Ornamentation did not stop there. Plating and inlaying with gold and silver were freely resorted to, and finely-wrought decoration in chiselled, inlaid, and *repoussé* work was profusely applied to the helmet and its appendages, to the corselet, the épaulières, and the brassarts. On the whole, however, despite the highly artistic character of its ornamentation, the loose, pendulous nature of Japanese armour detracted greatly from its workmanlike aspect, especially when the *horo* was added—a curious appendage in the shape of a curtain of fine transparent silk, which was either stretched in front between the horns of the helmet and the tip of the bow, or worn on the shoulders and back, the purpose in either case being to turn the point of an arrow. A true *samurai* observed the strict rules of etiquette with regard even to the garments worn under his armour, and it was part of his soldierly capacity to be able to bear the great weight of the whole without loss of activity, a feat impossible to any untrained man of modern days. Common soldiers, of course, who went on foot, wore much scantier protection; a comparatively light helmet and a corselet generally constituted their panoply.

[1] A Chinese historian, speaking of the Japanese invasion of Korea at the close of the 16th century, says of the *samurai* in action, that "he brandished a 5-foot blade with such rapidity that nothing could be seen except a white sheen of steel, the soldier himself being altogether invisible."

War-horses. The Japanese never had a war-horse worthy to be so called. The mis-shapen ponies which carried them to battle showed qualities of hardiness and endurance, but were so deficient in stature and massiveness that when mounted by a man in voluminous armour they looked painfully puny. Nothing is known of the early Japanese saddle, but at the beginning of historic times it approximated closely to the Chinese type. Subsequently a purely Japanese shape was designed. It consisted of a wooden frame so constructed that a padded numnah could be fastened to it. Galled backs or withers were unknown with such a saddle: it fitted any horse. The stirrup, originally a simple affair resembling that of China and Europe, afterwards took the form of a shoe-sole with upturned toe. Both stirrups and saddle-frame were often of beautiful workmanship, the former covered with rich gold lacquer, the latter inlaid with gold or silver. In the latter part of the military epoch chain armour was adopted for the horse, and its head was protected by a monster-faced mask of iron.

Early strategy and tactics. Flags were used in battle as well as on ceremonial occasions. Some were monochrome, as the red and white flags of the Taira and the Minamoto clans in their celebrated struggle during the 12th century; and some were streamers emblazoned with figures of the sun, the moon, a dragon, a tiger, and so forth, or with religious legends, as *Namu Amida Butsu* (the common invocation to Buddha), *Namu Horenkyo* (the formula of the Nichiren sect), or *Hachiman Daibosatsu* (the name of the god of battles). Fans with iron ribs were carried by commanding officers, and signals to advance or retreat were given by beating drums and metal gongs and blowing conches. During the military epoch it was considered proper that a campaign should be opened or a contest preluded by a human sacrifice to the god of war, the victim at this rite of blood (*chi-matsuri*) being generally a prisoner or a condemned criminal. Other preliminaries also had to be respected. Men went about the business of killing each other in an orderly and punctilious manner. Ambuscades and surprises played a large part in all strategy, but pitched battles were the general rule, and it was *de rigueur* that notice of an intention to attack should be given by discharging a "singing arrow." Thereafter the assaulting army, taking the word from its commander, raised a shout of "Ei! Ei!" to which the other side replied, and the formalities having been thus satisfied, the fight commenced. In early mediæval days tactics were of the crudest description. An army consisted of a congeries of little bands, each under the order of a chief who considered himself independent, and instead of subordinating his movements to a general plan, struck a blow wherever he pleased, thinking much more of his own reputation as a warrior than of the interests of the cause for which he fought. From time immemorial a romantic value has attached in Japan to the "first" of anything: the first snow of winter; the first water drawn from the well on New Year's Day; the first blossom of the spring; the first note of the nightingale. So in war the first to ride up to the foe or the wielder of the first spear was held in high honour, and the *samurai* strove for that distinction as his principal duty. It necessarily resulted, too, not only from the nature of the weapons employed, but also from the immense labour devoted by the true *samurai* to perfecting himself in their use, that displays of individual prowess were deemed the chief object in a battle. Some tactical formations borrowed from China were familiar in Japan, but their intelligent use and their modification to suit the circumstances of the time were inaugurated only by the great captains of the 15th and 16th centuries. Prior to that epoch a battle resembled a monster fencing match. Men fought as individuals, not as units of a tactical formation, and the engagement consisted of a number of personal duels, all in simultaneous progress. It was the *samurai's* habit to proclaim his name and titles in the presence of the enemy, sometimes adding from his own record or his father's any details that might tend to dispirit his hearers. Then some one advancing to cross weapons with him would perform the same ceremony of self-introduction, and if either found anything to upbraid in the other's antecedents or family history, he did not fail to make loud reference to it, such a device being counted efficacious as a means of disturbing an adversary's *sang-froid*. The duellists could reckon on finishing their fight undisturbed, but the victor frequently had to endure the combined assault of a number of the comrades or retainers of the vanquished. Of course a skilled swordsman did not necessarily seek a single combat; he was equally ready to ride into the thick of the fight without discrimination, and a group of common soldiers never hesitated to make a united attack upon a mounted officer if they found him disengaged. But the general feature of a battle was individual contests, and when the fighting had ceased, each *samurai* proceeded to the tent[1] of the commanding officer and submitted for inspection the heads of those whom he had killed.

Change of tactics. The disadvantage of such a mode of fighting was demonstrated for the first time when the Mongols invaded Japan in 1274. The invaders moved in phalanx, guarding themselves with pavises, and covering their advance with a host of archers shooting clouds of poisoned arrows.[2] When a Japanese *samurai* advanced singly and challenged one of them to combat, they opened their ranks, enclosed the challenger, and cut him to pieces. Many Japanese were thus slain, and it was not until they made a concerted movement of attack that they succeeded in driving back the enemy. Seven years later the Mongols, coming a second time, had a different reception. They were never suffered to land or to form their favourite phalanx. The Japanese, in small open boats, without any protection for the rowers, rushed again and again to the assault of the invaders' immense fleet, which consisted of comparatively large vessels, decked, protected by bulwarks of timber, matting, and shields, and equipped with artillery to which the Japanese could oppose only bow and arrow. When, however, the *samurai* succeeded in boarding a Chinese vessel, their swords did such terrible execution that the vessels of the huge flotilla, huddling together for mutual protection, abandoned their offensive *rôle*, and while vainly seeking a safe landing, were shattered by a tempest. But although the advantage of preventing an enemy from massing his strength was thus recognized, the Japanese themselves did not adopt the formation which the Mongols had shown to be so formidable. Individual prowess continued to be the prominent factor in battles down to a comparatively recent period. The great captains, Takeda Shingen and Uyesugi Kenshin, who flourished during the first half of the 16th century, are supposed to have been Japan's pioneer tacticians. They certainly appreciated the value of a formation in which the action of the individual should be subordinated to the unity of the whole. But when it is remembered that firearms had already been in the hands of the Japanese for several years, and that they had means of acquainting themselves with the tactics of Europe through their intercourse with the Dutch, it is remarkable that the changes attributed to Takeda and Uyesugi were not more drastic. Speaking broadly, what they did was to organize

[1] A tent was simply a space enclosed with strips of cloth or silk, on which was emblazoned the crest of the commander. It had no covering.

[2] The Japanese never at any time of their history used poisoned arrows; they despised them as depraved and inhuman weapons.

a column with the musqueteers and archers in front; the spearmen, halberdiers, and swordsmen in the second line; the cavalry in the third line; the commanding officer in the rear, and the drums and standards in the centre. At close quarters the spear proved a highly effective weapon, and in the days of Hideyoshi, the *Taikô*, combined flank and front attacks by bands of spearmen became a favourite device. The importance of a strong reserve also received recognition, and in theory, at all events, a tolerably intelligent system of tactics was adopted. Not until the close of the 17th century did the doctrine of strictly disciplined action obtain practical vogue. Yamaga Soko is said to have been the successful inculcator of this principle, and from his time the most approved tactical formation was known as the *Yamaga-ryu* (Yamaga style), though it showed no innovation other than strict subordination of each unit to the general plan.

Military principles.

Although, tactically speaking, the *samurai* was everything and the system nothing prior to the second half of the 17th century, and although strategy was chiefly a matter of deception, surprises, and ambushes, it must not be supposed that there were no "classical principles." The student of European military history searches in vain for the "rules and maxims of war" so often invoked by glib critics, but the student of Japanese history is more successful. Here, as in virtually every field of things Japanese, retrospect discovers the ubiquitous Chinaman. Sung and 'Ng—called in Japan "Son" and "Go"—Chinese generals of the third century after Christ, were the Jomini and the Hamley of their era, and their treatises continued to be the classics of Far Eastern captains through all generations. Yoshitsune, in the 12th century, deceived a loving girl to obtain a copy of Sung's work which her father had in his possession, and Yamaga, in the 17th century, when he set himself to compose a book on tactics, derived his materials almost entirely from the monographs of the two Chinese generals. There is proof that these treatises came into the hands of the Japanese in the 8th century, when the celebrated Kibi no Mabi went to study civilization in the Middle Kingdom, just as his successors of the 19th century went to study a new civilization in Europe and America. Thenceforth "Son" and "Go" became household words among Japanese soldiers. Their volumes were to the *samurai* what the *Mâhâyana sutra* was to the Buddhist. They were believed to have collected whatever of good had preceded them, and to have forecast whatever of good the future might produce. Something of that credit they certainly deserved, for their principles are not yet out of date:—

An army undertaking an offensive campaign must be twice as numerous as the enemy. A force investing a fortress should be numerically ten times the garrison. Troops for escalade should muster five for every one of their foes. When the adversary holds high ground, turn his flank; do not deliver a frontal attack. When he has a mountain or a river behind him, cut his lines of communication. If he deliberately assumes a position from which victory is his only escape, hold him there, but do not molest him. If you can surround him, leave one route open for his escape, since desperate men fight fiercely. Be warned of an ambush when you see birds soaring in alarm, and if animals break cover in your direction look out for a pending onset. When you have to cross a river, put your advance-guard and your rear-guard at a distance from the banks, and never approach with the bulk of your troops. When the enemy has to cross a river, let him get well engaged in the operation before you strike at him. If a march has to be traversed, make celerity your first object. Pass no copse, enter no ravine, nor approach any thicket until your scouts have explored it fully.

Such precepts are multiplied, and there is much about stratagems, deceptions and, above all, the employment of spies; but when those ancient authors discuss tactical formations, they do not seem to have contemplated anything like rapid, well-ordered changes of mobile, highly trained masses of men from one formation to another, or their quick transfer from point to point of a battlefield. The basis of their tactics is the *Book of Changes.* Here again is encountered the superstition that underlies nearly all Chinese and Japanese institutions: the superstition that took captive even the great mind of Confucius. The male and the female principles; the sympathetic and the antipathetic elements; cosmos growing out of chaos; chaos reabsorbing cosmos — on such phantasies they founded their tactical system. The result was a phalanx of complicated organization, difficult to manœuvre and liable to be easily thrown into confusion. Yet when Yamaga in the 17th century interpreted these ancient Chinese treatises, he detected in them suggestions for a very shrewd use of the principle of echelon, and applied it to devise formations which combined much of the frontal expansion of the line with the solidity of the column. More than that cannot be said for Japanese tactical genius. The *samurai* was the best fighting unit in the Orient—probably one of the best fighting units the world ever produced. It was perhaps because of that excellence that his captains remained indifferent tacticians.

Ethics of the samurai.

In estimating the military capacity of the Japanese, it is essential to know something of the ethical code of the *samurai*, the *bushi-do* ("way of the warrior") as it was called. The first source of information that presents itself is the rules of conduct prescribed by feudal chieftains, and of these a typical example is furnished in the code of Kato Kiyomasa, a celebrated general of the 16th century:—

Regulations for Samurai of every Rank; the Highest and Lowest alike.

1. The routine of service must be strictly observed. From 6 a.m. military exercises shall be practised. Archery, gunnery, and equestrianism must not be neglected. If any man shows exceptional proficiency he shall receive extra pay.
2. Those that desire recreation may engage in hawking, deer-hunting, or wrestling.
3. With regard to dress, garments of cotton or pongee shall be worn. Any man incurring debts owing to extravagance of costume or living shall be considered a law-breaker. If, however, being zealous in the practice of military arts suitable to his rank, he desires to hire instructors, an allowance may be granted to him for that purpose.
4. The staple of diet shall be unhulled rice. At social entertainments one guest for one host is the proper limit. Only when men are assembled for military exercises shall many dine together.
5. It is the duty of every *samurai* to make himself acquainted with the principles of his craft. Extravagant displays of adornment are forbidden in battle.
6. Dancing or organizing dances is unlawful; it is likely to betray sword-carrying men into acts of violence. Whatever a man does should be done with his heart. Therefore for the soldier military amusements alone are suitable. The penalty for violating this provision is death by suicide.
7. Learning shall be encouraged. Military books must be read. The spirit of loyalty and filial piety must be educated before all things. Poem-composing pastimes are not to be engaged in by *samurai*. To be addicted to such amusements is to resemble a woman. A man born a *samurai* should live and die sword in hand. Unless he is thus trained in time of peace he will be useless in the hour of stress. To be brave and warlike must be his invariable condition.
8. Whosoever finds these rules too severe shall be relieved from service. Should investigation show that any one is so unfortunate as to lack manly qualities, he shall be singled out and dismissed forthwith. The imperative character of these instructions must not be doubted.

The plainly paramount purpose of these rules was to draw a sharp line of demarcation between the *samurai* and the courtiers living in Kyôtô. The dancing, the couplet-composing, the sumptuous living, and the fine costumes of the officials frequenting the Imperial capital were strictly interdicted by the feudatories. Frugality, fealty, and filial piety—these may be called the fundamental virtues of the *samurai*. Owing to the circumstances out of which his caste had grown, he regarded all bread-winning pursuits with contempt, and despised money. To be swayed in the smallest degree by mercenary motives was despicable in his eyes.

Essentially a stoic, he made self-control the ideal of his existence, and practised the courageous endurance of suffering so thoroughly that he could without hesitation inflict on his own body pain of the most horrible description. The power of surrendering life with heroic calmness has been attained by men in all ages, and is regarded by philosophers as an elementary form of human virtue, practised with most success in an uncivilized state of society, before the finer appreciations of the imaginative and intellectual faculties have been developed by education. But the courage of the *samurai* cannot justly be ascribed to bluntness of moral sensibility resulting from semi-savage conditions of life. From the 8th century onwards the current of existence in Japan set with general steadiness in the direction of artistic refinement and voluptuous luxury, amidst which men could scarcely fail to acquire habits and tastes inconsistent with acts of high courage and great endurance. The *samurai's* mood was not a product of semi-barbarism, but rather a protest against emasculating civilization. He schooled himself to regard death by his own hand as a normal eventuality. The story of other nations shows epochs when death was welcomed as a relief and deliberately invited as a refuge from the mere weariness of living. But wherever there has been liberty to choose, and leisure to employ, a painless mode of exit from the world, men have invariably selected it. The *samurai*, however, adopted in *harakairi* (disembowelment) a mode of suicide so painful and so shocking that to school the mind to regard it with indifference and practise it without flinching was a feat not easy to conceive. Assistance was often rendered by a friend who stood ready to decapitate the victim immediately after the stomach had been gashed; but there were innumerable examples of men who consummated the tragedy without aid, especially when the sacrifice of life was by way of protest against the excesses of a feudal chief or the crimes of a ruler, or when some motive for secrecy existed. It must be observed that the suicide of the *samurai* was never inspired by any doctrine like that of Hegesias. Death did not present itself to him as a legitimate means of escaping from the cares and disappointments of life. Self-destruction had only one consolatory aspect, that it was the soldier's privilege to expiate a crime with his own sword, not under the hand of the executioner. It rested with his feudal chief to determine his guilt, and his peremptory duty was never to question the justice of an order to commit suicide, but to obey without murmur or protest. For the rest, the general motives for suicide were to escape falling into the hands of a victorious enemy, to remonstrate against some official abuse which no ordinary complaint could reach, or, by means of a dying protest, to turn a liege lord from pursuing courses injurious to his reputation and his fortune. This last was the noblest and by no means the most infrequent reason for suicide. Scores of examples are recorded of men who, with everything to make existence desirable, deliberately laid down their lives at the prompting of loyalty. Thus the *samurai* rose to a remarkable height of moral nobility. He had no assurance that his death might not be wholly fruitless, as indeed it often proved. If the sacrifice achieved its purpose, if it turned a liege lord from evil courses, the *samurai* could hope that his memory would be honoured. But if the lord resented such a violent and conspicuous mode of reproving his excesses, then the faithful vassal's retribution would be an execrated memory and, perhaps, suffering for his family and relatives. Yet the deed was perpetrated again and again. It remains to be noted that the *samurai* entertained a high respect for the obligations of truth; "A *bushi* has no second word," was one of his favourite mottoes. However, a reservation is necessary here. The *samurai's* doctrine was not truth for truth's sake, but truth for the sake of the spirit of uncompromising manliness on which he based all his code of morality. A pledge or a promise must never be broken, but the duty of veracity did not override the interests or the welfare of others.

Religious influence. Something more, however, than a profound conception of duty was needed to nerve the *samurai* for sacrifices such as he seems to have been always ready to make. It is true that Japanese parents of the military class took pains to familiarize their children of both sexes from very tender years with the idea of self-destruction at any time. The little boy was taught how the sword should be directed against his bosom; the little girl, how the dagger must be held to pierce the throat; and both grew up in constant fellowship with the conviction that suicide must be reckoned among the natural incidents of everyday existence. But superadded to the force of education and the incentive of tradition there was a transcendental influence. Buddhism supplied it. The tenets of that creed divided themselves, broadly speaking, into two doctrines, salvation by faith and salvation by works, and the chief exponent of the latter principle is the sect which prescribes "meditation" as the vehicle of enlightenment. Whatever be the mental processes induced by this rite, those who have practised it insist that it leads finally to a state of "absorption" in which the mind is flooded by an illumination revealing the universe in a new aspect, absolutely free from all traces of passion, interest, or affection, and showing, written across everything in flaming letters, the truth that for him who has found Buddha there is neither birth nor death, growth nor decay. Lifted high above his surroundings, he is prepared to meet every fate with indifference. The attainment of that state seems to have been a fact in the case both of the *samurai* of the military epoch, and of the Japanese soldier to-day, producing in the former readiness to look calmly in the face of any form of death, and in the latter a high type of patriotic courage.

Conscription. In 1873, after the transfer of the administrative authority from the Shogun to the Emperor had been completely consummated, the conscription system was re-introduced by the new Government. So far as concerned quality of material for organizing a national army, the *samurai* would have been unique. But since they were essentially an outgrowth of military feudalism, the abolition of the latter involved the disappearance of the former as a distinct class. Many persons viewed this hazardous experiment with deep misgiving. They feared that it would not only alienate the *samurai*, but also entrust the duty of defending the country to men unfitted by tradition and custom for such a task, namely, the farmers, artisans, and tradespeople, who, after centuries of exclusion from the military pale, might be expected to have lost all martial spirit. The Government, however, did not suffer itself to be deterred by these apprehensions. It argued that since the distinction of *samurai* and commoner had not originally existed, and since the former was a product, not of natural selection, but of accidental conditions, there was no valid reason to doubt the military capacity of the people at large. The justice of this reasoning was put to a speedy test. For, some three years after the introduction of the new system, an army of conscripts had to take the field against the *élite* of the *samurai*, and the result showed that the peasant, the mechanic, and the tradesman might safely be trusted to fight their country's battles. At 20 years of age every subject, of whatever status, becomes liable for conscription. There exists an accurate system of registration which places the authorities in possession of full information about each unit of the population, and effectually prevents any successful attempts to evade conscription. Conscripts are selected by lot after medical examination. The minimum height for the infantry, cavalry, and army service corps is 5·2 feet; that for the artillery and engineers, 5·4 feet. It rests with the Minister of War, under sanction of the Emperor, to determine what number of conscripts shall be taken each year. There are four principal kinds of service, namely, service with the colours (*genyeki*), for three years; service with the first reserves (*yobi*), for 4⅓ years; service with the second reserves (*gobi*), for 5 years; and service with the territorial troops (*kokuminhei*) up to the age of forty. There are also two bodies of supernumeraries (*hoju*). The first consists of men who, though liable for conscription and medically qualified, have escaped the lot for service with the colours. The second consists of those similarly liable and qualified, who have escaped not only the lot for service with the colours, but also the lot for service with the first supernumeraries. The period for the first supernumeraries is 7⅓ years, and that for the second, 1⅓ years, after which both pass into the territorial army. Their purpose is to fill vacancies in the troops with the colours, but in time of peace that liability devolves upon the first supernumeraries alone, and during the first year after conscription only. The full period of training for the first supernumeraries is 150 days, which may be divided according to convenience, but, in general, 90 days' training is given during the first year. The

second supernumeraries do not, in ordinary circumstances, receive any training during the interval of $1\frac{1}{3}$ years prior to their enrolment in the territorial army. As for the first reserves and the second reserves, each is called out twice during its full term, the first reserves for three or four weeks at a time, the second reserves for two weeks approximately. After reaching the territorial army a man is relieved from all further training. The total number of youths eligible for conscription each year is 427,000, and 60,000 are taken for service with the colours, 131,300 being drafted into the supernumeraries. A recruit upon whom the lot falls for service with the colours may be discharged before the expiration of three years if his conduct and aptitude are exceptional. Hitherto this privilege has never been granted earlier than the close of the second year of service.

A youth is exempted from liability to conscription if it be clearly established that his absence from home would deprive his family of the means of subsistence.[1] Rejection by medical examiners does not confer final immunity unless the cause is found to exist in two consecutive years.[2] Men who have been convicted of crime are disqualified, but those who have been temporarily deprived of civil rights on account of some offence must present themselves for conscription at the termination of their sentence. One of the chief exemptions is in connexion with education. Any youth attending the course of study at an officially recognized school or college of sufficiently high grade is exempted up to the age of 28, provided that in the meanwhile he volunteers for military training according to a system which will be presently explained. If he passes the age of 28 without volunteering, then he is taken for service with the colours, his chance of escaping by lot like an ordinary conscript being forfeited. After 28, if he has duly complied with the regulation as to volunteering, he passes into the territorial forces. Residence in a foreign country also secures exemption up to the age of 32—provided that official permission to go abroad has been obtained. A man returning after the age of 32 is drafted into the territorial army, but if he returns before that age he must volunteer to receive training, otherwise he is taken without lot for service with the colours. The system of volunteering is largely resorted to by persons of the better classes. Any youth who possesses certain educational qualifications, indicated by a diploma from an officially recognized school or college, or determined by passing a special examination, and who has not been guilty of any offence against the law, is entitled to volunteer for training. If accepted after medical inspection, he serves with the colours for one year, three months of which time must be passed in barracks like a common soldier—unless a special permit be granted by the colonel commanding the battalion—but for the remaining nine months attendance at drills alone is required. A volunteer serving with the infantry pays 62 *yen* on account of his clothing and equipments, and 38 *yen* on account of his food, and a cavalry volunteer has to defray an additional charge of 75 *yen* for the maintenance of a horse.[3] At the conclusion of a year's training the volunteer is drafted into the first reserve for $6\frac{1}{4}$ years, and then into the second reserve for 5 years, so that his total period ($12\frac{1}{4}$ years) of service before passing into the territorial army is the same as that of an ordinary conscript. Graduates of duly accredited normal schools and teachers in public elementary schools are exempted from more than six weeks' service with the colours, after which they pass at once into the territorial army, the Government defraying their expenses during the period of training. But if a teacher abandons that calling before the age of 28, he becomes liable, without lot,[4] to two years with the colours, unless he adopts the alternative of volunteering.

Officers.

Officers are obtained in two ways. There are six local preparatory schools (*yonen-gakko*) in various parts of the empire, where lads of from 13 to 15 are received as cadets if they can show—either by certificate or by examination—that they possess a certain degree of general education.[5] After three years at one of these schools, a graduate passes to the central preparatory school (*chuo-yonen-gakko*) in Tôkyô, where he spends twenty-one months. If he graduates with sufficient distinction at the latter institution he becomes eligible for admission to the officers' college (*shikan-gakko*) without further test of proficiency. The second method of obtaining officers is by competitive examination for admission to the officers' college. Graduates from officially recognized middle schools or higher educational institutions are only required to pass in mathematics and foreign languages, but all other candidates have to submit to a severe test. Each class of cadet, whether a graduate of the central preparatory school or a direct candidate by competitive examination, is sent to serve with the colours for a year, or at least six months, before commencing his course at the officers' college. During that time he is treated as a common soldier, except that his promotion to non-commissioned rank is rapid. The period of study at the officers' college is one year, and after graduating successfully the cadet is drafted for six months' service with the branch to which it is proposed that he shall be finally attached. At the end of that period his name is submitted to a council of staff officers who have watched his progress, and if they report favourably he receives a commission as a sub-lieutenant. Cadets for the scientific branches—engineers and artillery—are then sent to a special college where they receive a year's training, theoretical and practical.

Promotion and ranks.

There are three grades of privates, upper soldiers (*joto-hei*), first-class soldiers (*itto-sotsu*), and second-class soldiers (*nito-sotsu*). A private on joining is a second-class soldier. For proficiency and good conduct he is raised to the rank of first-class soldier, and ultimately to that of upper soldier. His pay, his duties, and the number of stripes on his arm vary with his grade. Non-commissioned officers are obtained from the ranks, or from special candidates. Their grades are corporal (*gocho*), sergeant (*gunso*), sergeant-major (*socho*), and special sergeant-major (*tokumu-socho*). If a soldier undertakes the duties of sergeant he must serve at least four years with the colours. He may, if he pleases, continue to serve in that capacity up to the age of 25, but

[1] This privilege led to great abuses originally. It became a common thing to employ some aged and indigent person, set him up as the head of a "branch family," and give him for adopted son a youth liable to conscription. The law is now framed so as to prevent all such frauds.

[2] This does not apply, of course, to permanent deformities.

[3] These payments are not final. If they prove insufficient the volunteer must be prepared to make good the deficiency. If they are found to be excessive the surplus is returned. In the case of youths who, though otherwise entitled to be volunteers, are in such straitened circumstances that they cannot defray the whole of the prescribed charges, the Government contributes a part.

[4] Conscription without lot is the punishment for all failures to comply with the military laws, or for any attempt to evade them by malingering or by fraudulent representations.

[5] Sons of officers' widows, or of officers in reduced circumstances, are educated at these schools either as free cadets or at half charges. In the latter case the payments are 10 *yen* yearly for clothes and 3·25 *yen* monthly for rations. In the case of the ordinary cadet the corresponding payments are 30 *yen* and 6·50 *yen* respectively. If a free, or half-free, cadet leaves school without graduating, he is required to pay up the total sum that he would have defrayed as an ordinary cadet.

a period of four years is compulsory. His service with the reserves is correspondingly reduced. Acceptance of the post of special sergeant-major entails the obligation of serving up to the age of 37, with the option of remaining until the age of 45. All the promotion in the non-commissioned ranks is by merit. Officers' ranks are the same as in the British army, but the nomenclature is much simpler. The terms, with their English equivalents, are *shoi* (second lieutenant), *chiui* (first lieutenant), *taii* (captain), *shosa* (major), *chiusa* (lieut.-colonel), *taisa* (colonel), *shosho* (major-general), *chiujo* (lieut.-general), *taisho* (general), *gensui* (field-marshal).[1] Promotion for officers in the junior grades is by seniority and merit. Two-thirds of the second lieutenants attain the rank of first lieutenant by seniority and one-third by merit. One-half of the first lieutenants are promoted to be captains by merit and one-half by seniority. After the rank of captain all promotion is by merit, and it results that many officers never rise higher than captain, in which case retirement is compulsory at the age of 48. It is necessary that a second lieutenant should have served at least two years before promotion to the rank of first lieutenant; the corresponding term for a first lieutenant being two years; for a captain, four years; for a major, three years; for a lieutenant-colonel, two years; and for a major-general, three years. Above the rank of lieutenant-general promotion is not governed by any rule.

The pay of non-commissioned officers and privates is as follows:—

	Per month. Yen.	s.	d.
First-class Special Sergeant-Major	14·10	28	6
Second-class Special Sergeant-Major	12·90	26	1
First-class Sergeant-Major	8·61	17	5
Second-class Sergeant-Major	8·01	16	2¼
First-class Sergeant	6·42	12	11½
Second-class Sergeant	5·85	11	10¼
First-class Corporal	5·07	10	3
Second-class Corporal	4·53	9	2
Upper Soldier	1·50	3	0½
First-class Private	1·20	2	5
Second-class Private	0·90	1	10

Rations and uniforms are also furnished. The men are paid weekly, and all have quarters within the barracks.

The officers' pay is as follows:—

	Yen.	Annually.
General	6000	£600
Lieutenant-General	4000	400
Major-General	3150	315
Colonel	2352	238
Lieutenant-Colonel	1752	175
Major	1152	115
Captain	708	71
First Lieutenant	468	47
Second Lieutenant	336	34[2]

There is also a carefully graduated system of retiring allowances, for which officers and non-commissioned officers become eligible after eleven years' full service with the colours. The figures, freed from confusing details, are these:—

	Yearly.
General—retiring allowance	£150 to £223
Lieutenant-General	120 ,, 175
Major-General	105 ,, 156
Colonel	75 ,, 112
Lieutenant-Colonel	60 ,, 89
Major	45 ,, 67
Captain	30 ,, 45
First Lieutenant	23 ,, 34
Second Lieutenant	18 ,, 26
Special Sergeant-Major	15 ,, 23

[1] The same terms are applied to the ranks of officers in the navy (with the exception of *gensui*), and thus all confusion about questions of relative rank is avoided.

[2] The pay is not uniform in the case of captains and lieutenants, but further details are unnecessary. When an officer is not actually serving, his pay is reduced by one-half approximately.

The army consists of 12 divisions, numbered from 1 to 12, and a division of Guards, making 13 divisions in all. Each division is under the command of a lieutenant-general, and is permanently stationed in a certain district. It is organized as a complete fighting unit, its composition being 4 regiments of infantry, 1 regiment of cavalry, 1 regiment of field artillery, 1 battalion of engineers, and 1 battalion of army service. A regiment of infantry consists of 4 battalions, and a battalion consists of 3 companies. A regiment of cavalry consists of either 3 or 4 squadrons, each squadron being 100 sabres. A regiment of field artillery consists of 6 batteries, and a battery has 6 guns. A battalion of engineers consists of 3 companies, or 600 men, and a battalion of army service numbers 300 men. It will thus be seen that the composition of a division—with the exception of the Guards division, which is somewhat smaller—is, infantry, 9600; cavalry, 300; artillery, 36 guns; engineers, 600; army service, 300. There are also 6 regiments of mountain artillery, or 216 guns in all. The total force of field artillery is 17 regiments, or 612 guns, and the total force of cavalry is 15 regiments, or about 5000 sabres. It is impossible to give absolutely accurate figures, as a certain reserve is exercised by the War Department. In addition to the above, the following divisions include extra corps, namely:—

Organization.

The Guards division has a brigade (2 regiments) of cavalry, a brigade (3 regiments) of field artillery, and a battalion of railway engineers.

The first division has a brigade (2 regiments) of cavalry, a brigade (3 regiments) of field artillery, and 1 regiment of garrison artillery for service in the Tôkyô Bay forts.

The fourth division has 1 regiment of garrison artillery for the Yura forts.

The fifth division has 1 regiment of garrison artillery for the Kure forts, and 1 battalion of garrison artillery for the Geiyo forts.

The sixth division has 1 regiment of garrison artillery for the Saseho forts, and 1 battalion of garrison artillery, together with 1 battalion of garrison infantry, for the Tsushima forts.

The seventh division has 1 battalion of garrison artillery for the Hakodate forts.

The tenth division has 1 battalion of garrison artillery for the Maizuru forts.

The twelfth division has 1 regiment of garrison artillery for the Shimonoseki forts.

When the scheme of army organization, adopted in 1896 after the war with China, is completed in 1905, the strength of the army on a peace footing will be 150,000 of all ranks, with 30,000 horses, and the strength on a war footing, 500,000 men, with 100,000 horses. It is impossible to state the exact strength, but a peace footing of 100,000 will be a very close approximation. Recruits for the Guards are taken from every part of the empire, but those for a division are taken from its district, each divisional district being divided for recruiting purposes into four regimental districts, each of which supplies recruits for a particular regiment. The garrisoning of Formosa is effected by a mixed brigade[3] furnished by the divisions in turn.

The Emperor is the Commander-in-Chief of the army, and theoretically the sole source of military authority, which he exercises through a general staff and a war department, with the assistance of a board of field-marshals (*gensuifu*).

[3] The term "mixed brigade" is used to indicate a brigade having the tactical units of a division, though proportionately smaller; namely, 2 regiments of infantry, 2 squadrons of cavalry, 3 batteries of field artillery, half a battalion of engineers, and half a battalion of army service.

The General Staff has for chief a field-marshal, and for vice-chief a general or lieutenant-general. It includes five offices for the transaction of ordinary business, as well as a survey bureau, a trigonometrical section, a cartographic section, and a topographic section, and the military college is under its direction. The War Department is presided over by a general officer whose name is borne on the active list, and who is a member of the cabinet without being necessarily affected by ministerial changes. A Tôkyô defence office, presided over by a lieutenant-general, superintends the defences of Tôkyô Bay; the same duty with regard to the other fortifications throughout the empire is entrusted to three major-generals, who have their headquarters in Yokohama, Shimonoseki, and Yura respectively; and the whole empire is divided into three military districts, the eastern, the central, and the western, each under the command of a general or lieutenant-general. There are, further, an artillery committee and an engineering committee, composed of experts from these two branches of the service, who consider all questions relating to the manufacture of arms and ammunition, and there is a remount office.

Medical service. The medical service is exceptionally well organized. It received unstinted praise from European and American experts who observed it closely during the wars of 1894–95 and of 1900. The fixed establishment of surgeons to each division is 100 approximately, and arrangements complete in every detail are made for affording relief to men in the fighting line, for bandaging stations, for field hospitals, for standing hospitals in the enemy's territory, and for special hospitals at home. Much assistance is rendered in this department of military affairs by the Red Cross Society of Japan, which has an income of two million *yen* annually, a fine hospital in Tôkyô, a large staff of trained nurses of both sexes, and two hospital ships specially built and equipped for the transport of wounded men. During the early part of the campaign in Pechili in 1900 the French column entrusted its wounded to the care of the Japanese.

Provisions. The staple article of commissariat for a Japanese army in the field is *hoshii* (dried rice), prepared by boiling rice and drying it in the sun or by artificial heat. Thus treated the rice shrinks into a small compass, and three days' supply can easily be carried in a bag by the soldier. When required for use the rice, being placed for a few moments in boiling water —cold water serves on emergency—swells to its original bulk, and is eaten with a relish of salted fish, dried sea-weed, or pickled plums. The task of provisioning an army on these lines is comparatively simple. The Japanese soldier, though low in stature, is well set up, muscular, and hardy. He has great powers of endurance, and one of his strong points is that he manœuvres with remarkable celerity, doing everything at the run, if necessary, and continuing to run without distress for a length of time astonishing to Occidental observers. He is much subject, however, to attacks of *kakke* (beri-beri), and if he has recourse to meat diet, which appears to be the best preventive, he will probably lose something of his capacity for prolonged rapid movement. He attacks with apparent indifference to danger, preserves his cheerfulness amid hardships, and has always shown himself thoroughly amenable to discipline.

Military schools. There are several schools for the special education of officers, non-commissioned officers, and military mechanics. The most important of these institutions is the *Rikugun Daigakko,* or Army College, where officers are prepared for service in the upper ranks and for staff appointments. A first or second lieutenant is eligible for admission after two years' service with the colours, provided that he is recommended by his commanding officer and passes a written examination in subjects indicated by the chief of the General Staff through the War Department, the examination papers being sent to the headquarters of the division to which the officer belongs. The course of study at the college extends over three years, and embraces scientific training of a high character. An officer's future promotion depends largely on the record he establishes at this college and on the place he obtains in the final examination. The Toyama School—so called because it is situated in the Toyama suburb of Tôkyô—stands next in importance to the Army College. The courses pursued there are in strategy and tactics, musketry, gymnastics, and fencing, and officers up to the rank of captain are admitted from the infantry, garrison artillery, or engineers, non-commissioned officers also being allowed to take the musketry course. The term of training is five months, and two batches of students graduate annually. For this school officers are selected by the commanders of the corps with which they are serving. Officers of the scientific branches are instructed at the *Hôkôgakko* (School of Artillery and Engineers), as already stated. While studying at any of these institutions an officer receives full pay, and all expenses connected with education or training are defrayed by the Government. There are, further, two special schools of gunnery—one for field artillery, the other for garrison artillery. The course at the Field Artillery School is for three months; admission is by recommendation of a commanding officer, and, as a general rule, first lieutenants and captains study there, though second lieutenants may be admitted on special recommendation. The Garrison Artillery School receives officers of similar rank belonging to that branch of the service, but it also receives sergeants and candidates for non-commissioned officers. The course for officers extends to four months, and the course for non-commissioned-officer candidates to eighteen months. The other educational institutions are—the Cavalry Practical School, the Army Service School, the Army Medical School, the Veterinary School, the Arsenal School, and the School of Military Music. Officers obtain admittance to these various schools by recommendation of divisional or regimental commanders, while in the Veterinary School and the Arsenal School common soldiers are trained to be farriers and armourers. There is an inspection department of military education, the inspector-general being an officer of the rank of lieut.-general, under whom are fifteen officers, ranking from lieut.-colonel to major-general, who act as inspectors not only of the various schools and colleges, but also of all educational matters connected with the different branches of the service.

Efficiency. The Japanese officer is one of the strongest features of the army. His pay is small according to European standards, but his mode of life is frugal. Quarters are not assigned to him in barracks. He lives outside, frequently with his own family, and when duty requires him to take his meals in barracks, food is brought to him in a luncheon-box. His uniform is plain and inexpensive,[1] and he has no desire to exchange it for "mufti," as so many Occidental officers have. Being thus without mess expenses, contribution to a band, or luxuries of any kind, and nearly always without private means to supplement his pay, his habits are thoroughly economical, and a campaign involves comparatively few privations for him. He devotes himself absolutely to his profession, living for nothing else, and since he is strongly imbued with an effective conception of the honour of his cloth, instances of his incurring disgrace by debts or dissipation are exceptional. The *samurai* as a distinctive class were abolished simultaneously with the feudal system, but they may be said to have been revived again in the officers of the modern army, who preserve and act up to all the old traditions. The system of promotion has evidently much to do with this good result, for no Japanese officer can hope to rise above the rank of captain unless, by showing himself really zealous and capable, he obtains from his commanding officer the recommendation without which all higher educational opportunities are closed to him. It might be supposed that under such a system favouritism would prevail more or less, but no scandal of that kind has come to public knowledge since the modern army was organized. Corruption also appears to be virtually absent. In the stormiest days of parliamentary warfare, when charges of dishonesty were freely preferred by party politicians against all departments of officialdom, no whisper ever impeached the integrity of army officers, and when the test of war has been applied, all the equipments of the service have been found complete and in good order. It is evident, indeed, that when an army of such magnitude is maintained at an annual outlay of 37,000,000 *yen* (£3,700,000), there cannot be very much opportunity for peculation.

The time devoted daily to the training of a soldier is from four to six hours, and the courses are theoretical and practical. In the practical course the subjects are—

[1] Uniform does not vary according to regiments or divisions. There is only one type for the whole of the infantry, one for the cavalry, and so on.

marching, movements in the ranks, gymnastics (to which special attention is paid), musketry or gunnery, artisanship, swimming, riding, movements against obstacles, making and taking cover, and constructing temporary bridges. In the theoretical course the subjects are—morality, distinctions of various arms of the service and their interactions, principles of tactical formation, duties of units of a body of troops, and duties in the field. With regard to exercises in the field there is no fixed limit of time. The captain of a company, using his own discretion, takes his men out for half a day, or a whole day, or for two or three days together, as often as he deems expedient. Generally these exercises in the case of a company take place twice a month, after the men have been a few months with the colours. A similar system holds with regard to field exercises for a battalion, a regiment, a brigade, or a division. The officer in command chooses the occasions and regulates the time. Every autumn manœuvres are organized on a large scale, two or more divisions taking part, and every second year there are special manœuvres for cavalry, artillery (field and garrison), and engineers. Rifle and gun practice is of three kinds—instruction practice, fighting practice, and test practice. The number of rounds of ball cartridge fired by the infantry soldier during the first year is 205, and the number during the second and third years, 185 rounds. The artillery fires 130 rounds per gun annually. There is no fixed rule as to the number of rounds fired at each practice; it varies according to the capacity shown by the individual soldier.

The articles carried by an infantry soldier in the field weigh altogether $43\frac{1}{2}$ ℔ (exclusive of the clothes he is actually wearing)—namely, arms, water-bottle, and accoutrements, $22\frac{1}{2}$ ℔; knapsack and contents, $20\frac{5}{8}$ ℔. The weight of a cavalry trooper's arms, &c., stands thus—carbine and ammunition, $10\frac{3}{8}$ ℔; sword, $3\frac{1}{2}$ ℔; clothes, $14\frac{1}{4}$ ℔; saddle and equipments, &c., 74 ℔; the total being $7\frac{1}{3}$ stone approximately. As the average weight of the trooper himself is 10 stone, the weight carried by the horse is $17\frac{1}{3}$ stone. The infantry soldier carries a repeating rifle of Japanese design (the Arisaka pattern), and the field and horse artillery have two patterns of guns, field and mountain, each having the same calibre (7·5 c.m., 2·955 inches), and each firing the same ammunition, of which the common shell weighs 4·28 kilo. (9·435 ℔). The field gun itself weighs 298 kilo. (nearly 6 cwt.), and the mountain gun, $103\frac{1}{2}$ kilo. (228 ℔); but these are being changed for a weapon designed by Colonel Arisaka. An arsenal in Tôkyô, another in Osaka, and a third in Taipeh (Formosa) are intended to supply arms and ammunition, but they have not hitherto been able fully to meet the requirements of the service. One difficulty has been that metal for dockyard and arsenal purposes has to be imported. An iron-foundry constructed at Wakamatsu in Kiushiu, however, will remedy this defect. Small arms are manufactured successfully and in sufficient quantities.

Arms.

Manufacture of arms, &c.

Originally the Government engaged French officers to assist in organizing the army and elaborating its system of tactics and strategy, and during several years a *mission militaire*, composed of competent experts, resided in Tôkyô and rendered valuable aid to the Japanese. Afterwards German officers were employed, but ultimately the services of foreigners were dispensed with altogether, and Japan now adopts the plan of sending picked men to complete their studies in Europe. She has followed her usual eclectic course in this matter, not modelling herself on any one foreign system, but choosing from each whatever seemed most desirable. (F. BY.)

IV. JAPANESE ART.

Since the article by Sir Rutherford Alcock in the ninth edition of this work, a great amount of historical, technical, and critical information has been brought to light, and the art-workers of New Japan have been by no means idle. It is now known that Japan can show a long and sustained history of artistic culture of which any nation might be proud. Absorbing Chinese civilization, when that was perhaps the worthiest and most complete in the world, Japan gave a royal welcome to all that her great neighbour could offer. Chinese religion, literature, art, and science were as swiftly assimilated in the 7th and 8th centuries of our era as European science and militarism in the latter part of the 19th century. In the middle of the 7th century even the Government was entirely remodelled on the Chinese bureaucratic plan, and a department of art was not forgotten. The emperors, then and for over 300 years later, devoted their energies to the cultivation of poetry, painting, sculpture, music, and many another art of refinement, leaving the cares of government in the hands of ambitious vassals. China was the fountain-head of all their knowledge and accomplishments, and nearly all that was not Chinese was regarded as barbaric and effete. Japanese art based on Chinese models attained a level during this era that it has scarcely since surpassed and, in some respects, has failed to equal. In following out its development it will be convenient to outline first the history of pictorial art, to which all other branches owe their most striking features.

Historic importance.

Pictorial Art.

The development of Japanese painting may be divided into six periods, each signalized by a wave of progress. *First Period.*—From the middle of the 6th century to the middle of the 9th century: the naturalization of Chinese and Chino-Buddhist art. *Second Period.*—From the middle of the 9th century to the middle of the 15th century: the establishment of great native schools under Kosé no Kanaoka and his descendants and followers, the pure Chinese school gradually falling into neglect. *Third Period.*—From the middle of the 15th century to the latter part of the 17th century: the revival of the Chinese style. *Fourth Period.*—From the latter part of the 17th to the latter part of the 18th century: the establishment of a popular school. *Fifth Period.*—From the latter part of the 18th to the latter part of the 19th century: the foundation of a naturalistic school, and the first introduction of European influence into Japanese painting; the acme and decline of the popular school. *Sixth Period.*—From about 1875 to the present time: a period of transition.

First Period.—Tradition refers to the advent of a Chinese artist named Nanriu, invited to Japan in the 5th century as a painter of the imperial banners, but of the labours and influence of this man and of his descendants we have no record. The real beginnings of the study of painting and sculpture in their higher branches must be dated from the introduction of Buddhism from China in the middle of the 6th century, and for three centuries after this event there is evidence that the practice of the arts was carried on mainly by or under the instruction of Korean and Chinese immigrants. The paintings of which we have any mention were almost limited to representations of Buddhist motives executed in the style of the Chinese masters of the T'ang dynasty (A.D. 618–905), notably Wu Tao-tsz' (8th century), of whose genius romantic stories are related. The oldest existing work of this period is a mural decoration in the hall of the

temple of Horiūji, Nara, attributed to a Korean priest named Donchô, who lived in Japan in the 6th century; and this painting, in spite of the destructive effects of time and exposure, shows traces of the same power of line, colour, and composition that stamps the best of the later examples of Buddhist art.

Second Period.—The native artist who crested the first great wave of Japanese painting was a court noble named Kosé no Kanaoka, living under the patronage of the Emperor Seiwa (850–59) and his successors down to about the end of the 9th century, in the midst of a long term of peace and culture. Of his own work few, if any, examples have reached us; and those attributed with more or less probability to his hand are all representations of Buddhist divinities, showing a somewhat formal and conventional design, with a masterly caligraphic touch and perfect harmony of colouring. Tradition credits him with an especial genius for the delineation of animals and landscape, and commemorates his skill by a curious anecdote of a painted horse which left its frame to ravage the fields, and was reduced to pictorial stability only by the sacrifice of its eyes. He left a line of descendants extending far into the 15th century, all famous for Buddhist pictures, and some engaged in establishing a native style, the "Wa-gwa riu."

At the end of the 9th century there were two exotic styles of painting, the Chinese and the Buddhist, and the beginning of a native style founded upon these. All three were practised by the same artists, and it was not until a later period that such became the badge of a school.

Chinese style.

The Chinese style (Kara riu), the fundamental essence of all Japanese art, had a fairly distinct history, dating back to the introduction of Buddhism into China (A.D. 62), and it is said to have been chiefly from the works of Wu Tao-tsz', the master of the 8th century, that Kanaoka drew his inspiration. This early Chinese manner, which lasted without sign of failure in the parent country down to the end of the 13th century, was characterized by a virile grace of line, a grave dignity of composition, striking simplicity of technique, and a strong but incomplete naturalistic ideal. The colouring, harmonious but subdued in tone, held a place altogether secondary to that of the outline, and was frequently omitted altogether, even in the most famous works. Shadows and reflexions were ignored, and perspective, approximately correct for landscape distances, was isometrical for near objects, while the introduction of a symbolic sun or moon lent the sole distinction between a day and a night scene. The art was one of imperfect evolution, but for thirteen centuries it was the only living pictorial art in the world, and the Chinese deserve the honour of having created landscape painting. The materials used were water colours, brushes, usually of deer-hair, and a surface of unsized paper, translucent silk, or wooden panel. Its chief motives were landscapes of a peculiarly wild and romantic type, animal life, trees and flowers, and figure compositions drawn from Chinese and Buddhist history and Taoist legend; and these, together with the grand aims and strange shortcomings of its principles and the limited range of its methods, were adopted almost without change by Japan. It was a noble art, but unfortunately the rivalry of the Buddhist and later native styles permitted it to fall into comparative neglect, and it was left for a few of the faithful, the most famous of whom was a priest of the 14th century named Kawô, to preserve it from inanition till the great Chinese "renaissance" that lent its stamp to the next period. The reputed founder of Japanese caricature may also be added to this list. He was a priest named Kakuyu, but better known as the Abbot of Toba, who lived in the 12th century. An accomplished artist in the Chinese manner, he amused himself and his friends by burlesque sketches, marked by a grace and humour that his imitators never equalled. Later, the motive of the "Toba pictures," as such caricatures were called, tended to degenerate, and the elegant figures of Kakuyu were replaced by scrawls that often substituted indecency and ugliness for art and wit. Some of the old masters of the Yamato school were, however, admirable in their rendering of the burlesque, and in modern times Kiôsai, the last of the Hokusai school, outdid all his predecessors in the riotous originality of his weird and comic fancies. A new phase of the art now lives in the pages of the *Maru-maru Chimbun*, the Tôkyô *Punch*.

Buddhist style.

The Buddhist style was probably even more ancient than the last, for the scheme of colouring distinctive of the Buddhist picture was almost certainly of Indian origin; brilliant and decorative, and heightened by a lavish use of gold, it was an essential to the effect of a picture destined for the dim light of the Buddhist temple. The style was applied only to the representations of sacred personages and scenes, and as the traditional forms and attributes of the Brahmanic and Buddhist divinities were mutable only within narrow limits, the subjects seldom afforded scope for originality of design or observation of nature. The principal Buddhist painters down to the 14th century were members of the Kosé, Takuma, and Kasuga lines, the first descended from Kanaoka, the second from Takuma Taméuji (ending 10th century), and the third from Fujiwara no Motomitsu (11th century). The last and greatest master of the school was a priest named Meichô, better known as Chô Densu, the Japanese Fra Angelico. It is to him Japan owes the possession of some of the most stately and most original works in Japanese art, sublime in conception, line, and colour, and deeply instinct with the religious spirit. He died in 1427, at the age of 76, in the seclusion of the temple where he had passed the whole of his days.

Native style.

The native style, Yamāto or Wa-gwa riu, was an adaptation of Chinese art canons to motives drawn from the Court life, poetry, and stories of old Japan. It was undoubtedly practised by the Kosé line, and perhaps by their predecessors, but it did not take shape as a school until the beginning of the 11th century under Fujiwara no Motomitsu, who was a pupil of Kosé no Kinmochi; it then became known as "Yamato riu," a title which two centuries later was changed to that of "Tosa," on the occasion of one of its masters, Fujiwara no Tsunétaka, assuming that appellation as a family name. The Yamato-Tosa artists painted in all styles, but that which was the speciality of the school, to be found in nearly all the historical rolls bequeathed to us by their leaders, was a lightly touched outline filled in with flat and bright body colours, in which a verdigris green played a great part. The originality of the motive did not prevent the adoption of all the Chinese conventionalities, and of some new ones of the artist's own. The curious expedient of spiriting away the roof of any building of which the artist wished to show the interior was one of the most remarkable of these. Amongst the foremost names of the school are those of Motomitsu (11th century), Nobuzané (13th century), Tsunétaka (13th century), Mitsunobu (15th and 16th centuries), his son Mitsushigé, and Mitsuōki (17th century). The long struggle between the Taira and Minamoto clans for the power that had long been practically abandoned by the Imperial line lasted through the 11th and the greater part of the 12th centuries, ending only with the rise of Generalissimo Yoritomo to supreme power in 1185. These internecine disturbances had been

unfavourable to any new departure in art, except those appertaining to arms and armour, and the strife between two puppet emperors for a shadow of authority in the 14th century brought another distracting element. It was not until the peace following the triumph of the northern dynasty was achieved through the prowess of an interested champion of the Ashikaga clan that the culture of ancient Japan revived. The palace of the Ashikaga Shoguns then replaced the Imperial Court as the centre of patronage of art and literature, and established a new era in art history.

Third Period.—It was towards the close of the Ashikaga Shogunate that painting entered a new phase. Talented representatives of the Kosé, Takuma, and Tosa lines maintained the reputation of the native and Buddhist schools, and the long-neglected Chinese school was destined to undergo a vigorous revival. The initiation of the new movement is attributed to a priest named Jôsetsu, who lived in the early part of the 15th century, and of whom little else is known. It is not even certain whether he was of Chinese or Japanese birth; he is, however, believed by some authorities to have been the teacher of three great artists—Shiūbun, Sesshiū, and Kano Masanobu—who became the leaders of three schools: Shiūbun, that of the pure Chinese art of the Sung and Yuen dynasties (10th and 13th centuries); Sesshiū, that of a modified school bearing his name; and Masanobu, of the great Kano school, which has reached to the present day. The qualities of the new Chinese schools were essentially those of the older dynasties: breadth, simplicity, a daringly caligraphic play of brush that strongly recalled the accomplishment of the famous scribes, and a colouring that varied between sparing washes of flat local tints and a strength and brilliancy of decorative effort that rivalled even that of the Buddhist pictures. The motives remained almost identical with those of the Chinese masters, and so imbued with the foreign spirit were many of the Japanese disciples, that it is said they found it difficult to avoid introducing Chinese accessories even into pictures of native scenery.

Sesshiū (1421–1507) was a priest who, after passing his meridian, visited China and studied painting there for several years, at length returning in 1469, disappointed with the living Chinese artists, and resolved to strike out a style of his own, based upon that of the old masters. He was the boldest and most original of Japanese landscape artists, leaving powerful and poetic records of the scenery of his own land as well as that of China, and trusting more to the sure and sweeping stroke of the brush than to colour. Shiūbun was an artist of little less power, but he followed more closely his exemplars, the Chinese masters of the 12th and 13th centuries; while Kano Masanobu (1424–1520), trained in the love of Chinese art, departed little from the canons he had learned from Jôsetsu or Oguri Sôtan. It was left to his more famous son, Motonobu, to establish the school which bears the family name. Kano Motonobu (1477–1559) is esteemed one of the greatest of Japanese painters, an eclectic of genius, who excelled in every style and every branch of his art. His variety was inexhaustible, and he remains to this day a model whom the most distinguished artists are proud to imitate. The names of the celebrated members of this long line are too many to quote here, but the most accomplished of his descendants was Tanyū, who died in 1674, at the age of seventy-three. The close of this long period brought a new style of art, that of the Kôrin school. Ogata Kôrin (1653–1710) is claimed by both the Tosa and Kano schools, but his work bears more resemblance to that of an erratic offshoot of the Kano line named Sotatsu than to the typical work of the academies. He was an artist of eccentric originality, who achieved wonders in bold decorative effects in spite of a studied contempt for detail. It is difficult to know whether he was more genius or charlatan, for he was a sort of Cagliostro in art. As a lacquer painter, however, he left a strong mark upon the work of his contemporaries and successors. His brother and pupil, Kenzan, adopted his style, and left a reputation as a decorator of pottery hardly less brilliant than Kôrin's in that of lacquer; and a later follower, Hôitsu (1762–1828), greatly excelled the master in delicacy and refinement, although inferior to him in vigour and invention.

Down to the end of this era painting was entirely in the hands of a patrician caste—courtiers, priests, feudal nobles and their military retainers, all men of high education, gentle birth, living in a polished circle. It was practised more as a phase of æsthetic culture than with any utilitarian views. It was a labour of love or loving service, untouched by the spirit of material gain, conferring, in its result, upon the work of the older masters a dignity and poetic feeling which we vainly seek in much of the later work. Unhappily, but almost inevitably, over-culture led to a gradual falling-off from the old virility. The strength of Meichô, Sesshiū, Motonobu, and Tanyū gave place to a more or less slavish imitation of the old Japanese painters and their Chinese exemplars, till the heirs to the splendid traditions of the great masters of the past preserved little more than their conventions and shortcomings. It was time for a new departure, but there seemed to be no sufficient strength left within the charmed circle of the orthodox schools, and the new movement was fated to come from the masses, whose voice had hitherto been silent in the art world.

Fourth Period.—A new era in art began in the latter half of the 17th century with the establishment of a popular school under an embroiderer's draughtsman named Hishigawa Moronobu (*circa* 1646–1713). Perhaps no great change is ever entirely a novelty. The old painters of the Yamato-Tosa line had frequently shown something of the daily life around them, and one of the later scions of the school, named Iwasa Matahei, had even made a speciality of this class of motive; but so little is known of Matahei and his work, that even his period is a matter of dispute, and the few pictures attributed to his pencil are open to question on grounds of authenticity. He probably worked some two generations before the time of Moronobu, but there is no reason to believe that his labours had any material share in determining the creation and trend of the new school. Moronobu was a consummate artist, with all the delicacy and caligraphic force of the best of the Tosa masters, whom he undoubtedly strove to emulate in style; and his pictures are not only the most beautiful but the most trustworthy records of the life of his time. It was not to his paintings, however, that he owed his greatest influence, but to the powerful impulse he gave to the illustration of books and broadsides by wood-engravings. It is true that illustrated books were known as early as 1608, if not before, but they were few and unattractive, and did little to inaugurate the great stream of *Ēhon*, or picture books, that were to take so large a share in the education of his own class. It is to him, and to him only, that Japan owes the first development and popularization of artistic wood-engraving, for there was nothing before his series of xylographic albums that approached his best work in strength and beauty, and nothing since that has surpassed it. Later there came abundant aid to the good cause of popular art, partly from pupils of the Kano and Tosa schools, but mainly from the artisan class. Most of these artists were designers for books and broadsides by calling,

painters only on occasion, but a few of them did nothing for the engravers. The story of these men will be told elsewhere—how engraving in black and white and in colours prospered in their hands down to the present day. Throughout the whole of this period, embracing about a hundred years, there still continued to work, altogether apart from the men who were making the success of popular art, a large number of able painters of the Kano, Tosa, and Chinese schools, who multiplied pictures that had every merit except that of originality. These men, living in the past, paid little attention to the great popular movement, which seemed to be quite outside their social and artistic sphere and scarcely worthy of cultured criticism. It was in the middle of the 18th century that the decorative, but relatively feeble, Chinese art of the later Ming period found favour in Japan and a clever exponent in a painter named Riūrikiô. It must be regarded as a sad decadence from the old Chinese ideals, which was further hastened, from about 1765, by the popularity of the southern Chinese style. This was a weak affectation that found its chief votaries amongst literary men ambitious of an easily-earned artistic reputation. The principal Japanese supporter of this school was Taigadô (1722–1775), but the volume of copies of his sketches, *Taigadô sansui juséki*, published about 1870, is one of the least attractive albums ever printed in Japan.

The *fifth period* was introduced by a movement as momentous as that which stamped its predecessor—the foundation of a naturalistic school under a group of men outside the orthodox academical circles. The naturalistic principle was by no means a new one; some of the old Chinese masters were naturalistic in a broad and noble manner, and their Japanese followers could be admirably and minutely accurate when they pleased, but too many of the latter were content to construct their pictures out of fragmentary reminiscences of ancient Chinese masterpieces, not presuming to see a rock, a tree, an ox, or a human figure, except through Chinese spectacles. It was a farmer's son named Okiô, trained in his youth to paint in the Chinese manner, who was first bold enough to adopt as a canon what his predecessors had only admitted under rare exceptions, the principle of an exact imitation of nature. Unfortunately, even he had not all the courage of his creed, and while he would paint a bird or a fish with perfect realism, he no more dared to trust his eyes in larger motives than did the most devout follower of Shiūbun or Motonobu. He was essentially a painter of the classical schools, with the speciality of elaborate reproduction of detail in certain sections of animal life, but fortunately this partial concession to truth, emphasized as it was by a rare sense of beauty, did large service. Okiô rose into notice about 1775, and a number of pupils flocked to his *atelier* in Shijô Street, Kyôtô (whence the name "Shijô school"). Amongst these the most famous were Goshun (1742–1811), who is sometimes regarded as one of the founders of the school; Sosen (1757–1821), an animal painter of remarkable power, but especially celebrated for pictures of monkey life; Shiūhô, the younger brother of the last, also an animal painter; Rôsetsu (1755–1799), the best landscape painter of his school; Keibun, a younger brother of Goshun, and some later followers of scarcely less fame, notably Hoyen, a pupil of Keibun; Tessan, an adopted son of Sosen; Ippô and Yôsai (1788–1878), well known for a remarkable set of volumes, the *Zenken Kojitsu*, containing a long series of portraits of ancient Japanese celebrities. Ozui and Ojiu, the sons of Okiô, painted in the style of their father, but failed to attain great eminence. Lastly, amongst the associates of the Shijô master was the celebrated Ganku (1798–1837), who developed a special style of his own, and is sometimes regarded as the founder of a distinct school. He was, however, greatly influenced by Okiô's example, and his sons, Gantai, Ganrio, and Gantoku or Renzan, drifted into a manner almost indistinguishable from that of the Shijô school.

Naturalistic school.

It remains only to allude to the European school, if school it can be called, founded by Kokan and Denkichi, two contemporaries of Okiô. These artists, at first educated in one of the native schools, obtained from a Hollander in Nagasaki some training in the methods and principles of European painting, and left a few oil paintings in which the laws of light and shade and perspective were correctly observed. They were not, however, artists of sufficient capacity to render the adopted manner more than a subject of curiosity, except to a few followers who have reached down to the present generation. It is possible that the essays in perspective found in the pictures of Hokusai, Hiroshigé, and some of the popular artists of the 19th century, were suggested by the Kokan's drawings and writings.

European school.

The *sixth period* began about 1875, when an Italian artist was engaged by the Government as a professor of painting in the Engineering College at Tôkyô. Since that time some distinguished European artists have visited Japan, and several Japanese students have made a pilgrimage to Europe to see for themselves what lessons may be gained from Western art, but it is a noteworthy fact that the pictures painted in the foreign style have as yet found little patronage either from native connoisseurs or foreign admirers of Japanese art. The Government, however, has instituted a department of art, and has done invaluable service in protecting the priceless treasures still lying in the temples of Japan. The Emperor extends his personal patronage to living artists who display special ability. Fine-art schools in Tôkyô and Kyôtô are well organized and conducted by talented native professors, and a Society of Oil Painters, *Hakuba Kuwai*, is doing good work. Art exhibitions are held at frequent intervals, and show that the old power both of painting and sculpture is still alive. Two good art magazines, with admirable reproductions of ancient and modern works, are now in course of publication, and two volumes of a large and important collection of copies by photographic and other processes of old masterpieces, edited by some of the leading connoisseurs of the country, appeared in 1901. The future of Japanese art is still "on the knees of the gods," but the art of the past has never found a higher appreciation than at present. The time has not yet come for the almost inevitable revolution, but the change awaits only the man, and it is to be devoutly hoped that when it is accomplished it will preserve all that we most admire in the splendid but incomplete art of the old masters.

(W. AN.)

Glyptic and Applied Art.

Historical Sketch.—The principal forms of modern glyptic art have been referred to in the earlier article, but more recent historical research has shown that sculpture in wood and metal is of ancient date in Japan, and claims a prominent position in the history of the world's art. Its antiquity is not, indeed, comparable to that of ancient Egypt or Greece, but no country in the world besides Japan can boast a living and highly-developed art that has numbered upwards of twelve hundred years of unbroken and brilliant productiveness. Setting aside prehistoric and rudimentary essays in stone and metal, which have their special interest for the antiquary, we have examples of sculpture in wood and metal, magnificent in conception and technique, dating from the earliest periods of what

we may term historical Japan, that is, from near the beginning of the great Buddhist propaganda under the Emperor Kimmei (A.D. 540 to 571) and the princely hierarch, Shôtoku Taishi (573 to 621). It may be here mentioned that stone has never been in favour in Japan as a material for the higher expression of the sculptor's art.

The *first historical period* of glyptic art in Japan reaches from the end of the 6th to the end of the 12th century, culminating in the work of the great Nara sculptors, Unkei and his pupil Kwaikei. Happily, there are still preserved in the great temples of Japan, chiefly in the ancient capital of Nara, many noble relics of these six hundred years, but only a few of the number need be noticed here. The place of honour in the selection may perhaps be conferred upon sculptures in wood, representing the Indian Buddhists, Asangha and Vasabandhu, preserved in the Golden Hall of Kofukuji, Nara. These are attributed to a Kamakura sculptor of the 8th or 9th century, and in simple and realistic dignity of pose and grand lines of composition are not unworthy of comparison with some of the works of ancient Greece. With these may be named the vigorous demon lantern-bearers, so perfect in the grotesque treatment of the diabolical heads and the accurate anatomical forms of the sturdy body and limbs; the colossal Temple Guardians of the great gate of Tôdaiji, by Unkei and Kwaikei (11th century), somewhat conventionalized, but still bearing evidence of direct study from nature, and inspired with intense energy of action; and the smaller but more accurately modelled Temple Guardians in the Saikondo, Nara, which almost compare with the "Fighting Gladiator" in their realization of menacing strength. The "Goddess of Art" of Akishino-dera, Nara, attributed to the 8th century, may be named as the most graceful and least conventional of the female sculptures in Japan, but infinitely remote from the feminine conception of the Greeks. The wooden portrait of Vimalakirtti, attributed to Unkei, at Kofukuji, Nara, has some of the qualities of the images of the two Indian Buddhists. The sculptures attributed to Jôchô, the founder of the Nara school, although powerful in pose and masterly in execution, lack the truth of observation seen in some of the earlier and later masterpieces.

The most perfect of the ancient bronzes is the great image of Bhaichadjyaguru in the temple of Yakushiji, Nara, attributed to a Korean monk of the 7th century, named Giogi. The bronze image of the same divinity at Hôriuji, said to have been cast at the beginning of the 7th century by Tori Busshi, the grandson of a Chinese immigrant, is of good technical quality, but much inferior in design to the former. The colossal Nara Daibutsu (Vairotchana) at Tôdaiji, cast in 749 by a workman of Korean descent, is the largest of the great bronzes in Japan, but ranks far below the Yakushiji image in artistic qualities. The present head, however, is a later substitute for the original, which was destroyed by fire.

The great Nara school of sculpture in wood was founded in the early part of the 11th century by a sculptor of Imperial descent named Jôchô, who is said to have modelled his style upon that of the Chinese wood-carvers of the T'ang dynasty, and his traditions were maintained by his descendants and followers down to the beginning of the 13th century. It is to be noticed that all the artists of this period were men of aristocratic rank and origin, and were held distinct from the carpenter architects of the imposing temples which were to contain their works.

Sacred images were not the only specimens of glyptic art produced in these six centuries; reliquaries, bells, vases, incense-burners, candlesticks, lanterns, decorated arms and armour, and many other objects, showing no less mastery of design and execution, have reached us. Gold and silver had been applied to the adornment of helmets and breastplates from the 7th century, but it was in the 12th century that the decoration reached the high degree of elaboration shown us in the armour of the Japanese Bayard, Yoshitsuné, which is still preserved at Kasuga, Nara.

Wooden masks employed in the ancient theatrical performances were made from the 7th century, and offer a distinct and often grotesque phase of wood-carving. We do not know by what class of sculptors these were executed, but their designs have been carefully preserved and imitated down to the present day.

The *second period* in Japanese glyptic art extends from the beginning of the 13th to the early part of the 17th century. The great struggle between the Taira and Minamoto clans had ended, but the militant spirit was still strong, and brought work for the artists who made and ornamented arms and armour. The Miôchins, a line that claimed ancestry from the 7th century A.D., were at the head of their calling, and their work in iron breastplates and helmets, chiefly in repoussé, is still unrivalled. It was not until the latter half of the 15th century that there came into vogue the elaborate decoration of the sword, a fashion that was to last four hundred years. The metal guard (*tsuba*), made of iron or precious alloy, was adorned with engraved designs, often inlaid with gold and silver. The free end of the hilt was crowned with a metallic cap or pommel (*kashira*), the other extremity next the *tsuba* was embraced by an oval ring (*fuchi*), and in the middle was affixed on each side a special ornament called the *mênuki*, all adapted in material and workmanship to harmonize with the guard. The *kodzuka* or handle of a little knife implanted into the sheath of the short sword or dagger was also of metal and engraved with like care. The founder of the first great line of *tsuba* and *mênuki* artists was Gotô Yûjô (1440–1512), a friend of the painter Kano Motonobu, whose designs he adopted. Many families of sword artists sprang up at a later period, the Nara, Hirata, Hamano, Omori, and Umétada lines furnishing treasures for the collector even down to the present day, and their labours reached a level of technical mastery and refined artistic judgment almost without parallel in the art industries of Europe. The men by whom these beautiful works were executed, like the makers of the blade, were members of the military caste. Buddhist sculpture was by no means neglected during this period, but there are few works that call for special notice. The most noteworthy effort was the casting by Ono Goroyémon in 1252 of the well-known bronze image, the Kamakura "Daibutsu."

The *third period* includes the 17th, 18th, and the greater part of the 19th centuries. It was the era of the artisan artist. The makers of Buddhist images and of sword ornaments carried on their work with undiminished industry and success, and some famous schools of the latter, notably the Nara, Hirata, Hamano, and Omori lines, arose during this period. The Buddhist sculptors, however, tended to grow more conventional and the metal-workers more naturalistic as the 18th century began to wane. It was in connexion with architecture that the great artisan movement began. The initiator was Hidari Jingoro (1594–1652), at first a simple carpenter, afterwards one of the most famous sculptors in a land of great artists. The gorgeous decoration of the mausoleum of Iyéyasu at Nikkô, and of the gateway of the Nishi Hongwanji temple at Kyôtô, are the most striking instances of his handiwork or direction. The pillars, architraves, ceilings, panels, and almost every available part of the structure, are covered with arabesques and sculptured figures of dragons, lions, tigers, birds, flowers, and even pictorial compositions with landscape and figures, deeply carved in solid or open work—the wood

sometimes plain, sometimes overlaid with pigment and gilding, as in the panelled ceiling of the chapel of Iyéyasu in Tôkyô. The designs for these decorations, like those of the sword ornaments, were adopted from the masters of the great schools of painting, but the invention of the sculptor was by no means idle. It was from this time that the temple carvers, although still attached to the carpenters' guild, took a place apart from the rest of their craft, and the genius of Hidari Jingoro secured for one important section of the artisan world a recognition like that which Hishigawa Moronobu, the painter and book illustrator, a few generations afterwards won for another.

A little later arose another art industry, also emanating from the masses. The use of tobacco, which became prevalent in the 17th century, necessitated the pouch. In order to suspend this from the girdle there was employed a kind of button or toggle—the *nêtsukê*. The metallic bowl and mouthpiece of the pipe offered a tempting surface for embellishment, as well as the clasp of the pouch; and the *nêtsukê*, being made of wood, ivory, or other material susceptible of carving, also gave occasion for art and ingenuity. The *nêtsukê*, indeed, was not entirely new, for it had been employed as a pendant to the *inro*, or medicine-box, from the time of Ashikaga Yoshimasa (1444–1473), but it had not come into general use. The carver, a clever artisan, did not feel bound to follow traditional models as the temple sculptors did, but, light-hearted fellow as he was, he liked to produce comic and cheery images, or simple objects that daily familiarity had endeared to him; and when he took up classical or religious themes he treated them in his own manner, never fearing to sacrifice dignity to humour. The engravers of pipes, pouch clasps, and the metallic discs (*kagami-buta*) attached to certain *nêtsukês*, sprang from the same class, and were little more serious and not less original. They worked, too, with a skill little inferior to that of the Gotôs, Naras, and other aristocratic sculptors of sword ornaments, and often with a refinement which their relative disadvantages in education and associations render especially remarkable. The *nétsuké* and the pipe, with all that pertained to it, were for the commoners what the sword hilt and guard were for the gentry. Neither class cared to bestow jewels upon their persons, but neither spared thought or expense in the embellishment of the object they most loved. The most honoured names amongst *nétsuké*-carvers are those of Shiūzan and Démé-Uman.

The final manifestation of popular glyptic art was the *okimono*, an ornament pure and simple, or one in which utility was altogether secondary in intention to decorative effect. The manufacture as a special branch of art work dates from the rise of the naturalistic school of painting and the great expansion of the popular school under the Katsugawas, but the *okimono* was not altogether a modern innovation, for it formed an occasional amusement of the older glyptic artists from remote times. Some of the most exquisite and most ingenious of these earlier productions, such as the magnificent iron eagle in the South Kensington Museum, the wonderful articulated models of crayfish, dragons, serpents, birds, that are found in many European collections, came from the *ateliers* of the Miôchins; but these were the play of giants, and were not made as articles of commerce. The new artisan makers of the *okimono* struck out a line for themselves, one influenced more by the naturalistic and popular schools than by the classical art, and the quails of Kaméjo, the tortoises of Seimin, the dragons of Tôün and Tôriū, and in recent years the falcons and the peacocks of Susuki Chôkichi, are the joy of the European collector. These are usually modelled in wax and cast in bronze and various other alloys, and sometimes in pure silver, and finished, if necessary, with the chisel and graver; they are sometimes fashioned in *repoussé* with the hammer. The best of these are exquisite in workmanship, graceful in design, often strikingly original in conception, and usually naturalistic in ideal. They constitute a phase of art in which Japan has few rivals.

The present generation is more systematically commercial in its glyptic produce than any previous age. Millions of *articles de commerce* in metal work, wood, and ivory flood the European markets, and may be bought in any street in Europe at a small price, but they offer a variety of design and an excellence of workmanship which place them almost beyond Western competition. Above all this, however, the Japanese sculptor is a force in art. He is nearly as thorough as his forefathers, and maintains the same love of all things beautiful; and if he cannot show any epoch-making novelty, he is at any rate doing his best to support unsurpassed the decorative traditions of the past.

(W. AN.)

Modern Developments of Applied Art.

Metal Work.—There is a radical difference between the point of view of the Japanese connoisseur and the point of view of the Western connoisseur in estimating the merits of sculpture on metal. The quality of the chiselling is the first feature to which the Japanese directs his attention; the decorative design is the prime object of the Occidental's attention. With very rare exceptions, the decorative methods of Japanese sword furniture were always supplied by painters. Hence it is that the Japanese connoisseur draws a clear line of distinction between the decorative design and its technical execution, crediting the former to the pictorial artist and the latter to the sculptor. He detects in the stroke of a chisel and the lines of a graving tool subjective beauties which appear to be hidden from the great majority of Western dilettanti. He estimates the rank of a specimen by the quality of the chisel work. The Japanese *kinzoku-shi* (metal sculptor) used thirty-six principal classes of chisel, each with its distinctive name, and as most of these classes comprised from five to ten sub-varieties, his cutting and graving tools aggregated about two hundred and fifty.

The field for sculptured decoration.

Scarcely less important in Japanese eyes than the chiselling of the decorative design itself is the preparation of the field to which it is applied. There used to be a strict canon with reference to this in former times. *Namako* (fish-roe) grounds were counted *de rigueur* for the mountings of swords worn on ceremonial occasions, the *ishime* (stone-pitting) or *jimigaki* (polished) styles being considered less aristocratic. As a broad definition, it may be said that *namako* is obtained by punching the whole surface—except the portion carrying the decorative design—into a texture of microscopic dots. The first makers of *namako* did not aim at regularity in the distribution of these dots; they were content to produce the effect of millet-seed sifted haphazard over the surface. But from the 15th century the punching of the dots in rigidly straight lines came to be considered essential, and the difficulty involved in this *tour de force* was so great that *namako*-making took its place among the highest achievements of the sculptor. When it is remembered that the punching tool was guided solely by the hand and eye, and that three or more blows of the mallet had to be struck for every dot, some conception may be formed of the patience and accuracy needed to produce these tiny protuberances in perfectly straight lines, at exactly equal intervals and of absolutely uniform size. *Namako* disposed in straight parallel lines originally ranked at the head of this kind of work. But a new kind was intro-

duced in the 16th century. It was obtained by punching the dots into intersecting lines, so arranged that the dots fell uniformly into diamond-shaped groups of five each. This is called *go-no-me namako*, because of its resemblance to the disposition of chequers in the Japanese game of *go*. A century later, the *daimyo namako* was invented, in which lines of dots alternated with lines of polished ground. As for *ishime*, it may be briefly described as diapering. There is scarcely any limit to the ingenuity and skill of the Japanese expert in diapering a metal surface. A Tôkyô collector possesses a silver teapot having its surface recessed in forty leaf-shaped panels, each filled with a different diaper of extraordinarily minute and delicate workmanship. It is not possible to enumerate here even the principal styles of *ishime*, but mention may be made of the *zara-maki* (broad-cast), in which the surface is finely but irregularly pitted after the manner of the face of a stone; the *nashiji* (pear-ground), in which we have a surface like the rind of a pear; the *hari-ishime* (needle *ishime*), where the indentations are so minute that they seem to have been made with the point of a needle; the *gama-ishime*, which is intended to imitate the skin of a toad (*gama*); the *tsuya-ishime*, produced with a chisel sharpened so that its traces have a lustrous (*tsuya*) appearance; the *ore-kuchi* (broken tool), a peculiar kind obtained with a jagged tool; and the *gozamê*, which resembles the plaited surface of a fine straw mat.

Great importance has always been attached by Japanese experts to the patina of metal used for artistic chiselling. It was mainly for the sake of their patina that value attached to the remarkable alloys *shakudo* (3 parts of gold to 97 of copper) and *shibuichi* (1 part of silver to 3 of copper). Neither metal, when it emerges from the furnace, has any beauty, *shakudo* being simply dark-coloured copper, and *shibuichi* pale gun-metal. But after proper treatment[1] the former develops a glossy black patina with violet sheen, and the latter shows beautiful shades of gray with silvery lustre. Both these compounds afford delicate, unobtrusive, and effective grounds for inlaying with gold, silver, and other metals, as well as for sculpture, whether incised or in relief. Copper, too, by patina-producing treatment, is made to show not merely a rich golden sheen with pleasing limpidity, but also red of various hues, from deep coral to light vermilion, several shades of gray, and browns of numerous tones from dead-leaf to chocolate. Even greater value has always been set upon the patina of iron, and many secret recipes were preserved in artist families for producing the fine, satin-like texture so much admired by all connoisseurs.

Patina.

In Japan, as in Europe, three varieties of relief carving are distinguished—*alto* (*taka-bori*), *mezzo* (*chiuniku-bori*), and *basso* (*usuniku-bori*). But it may be added that, in the opinion of the Japanese expert, these styles hold the same respective rank as that occupied by the three kinds of ideographic script in the realm of caligraphy. High relief carving corresponds to the *kaisho*, or most classical form of writing; medium relief to the *gyosho*, or semi-cursive style; and low relief to the *sosho* or grass character. With regard to incised chiselling, the commonest form is "hair-carving" (*kebori*), which may be called engraving, the lines being of uniform thickness and depth. Very beautiful results are obtained by the *kebori* method, but incomparably the finest work in the incised class is that known as *kata-kiri-bori*. In this kind of chiselling the Japanese artist can claim to be unique as well as unrivalled. Evidently the idea of the great Yokoya experts, the originators of the style, was to break away from the somewhat formal monotony of ordinary engraving, where each line performs exactly the same function, and to convert the chisel into an artist's brush instead of using it as a common cutting tool. They succeeded admirably. In the *kata-kiri-bori* every line has its proper value in the pictorial design, and strength and directness become cardinal elements in the strokes of the burin just as they do in the brushwork of the picture painter. The same fundamental rule applied, too, whether the field of the decoration was silk, paper, or metal. The artist's tool, be it brush or burin, must perform its task by one effort. There must be no appearance of subsequent deepening, or extending, or recutting, or finishing. *Kata-kiri-bori* by a great expert is a delight. One is lost in astonishment at the nervous yet perfectly regulated force and the unerring fidelity of every trace of the chisel. Another variety of carving much affected by artists of the 17th century, and now largely used, is called *shishi-ai-bori*, or *niku-ai-bori*. In this style the surface of the design is not raised above the general plane of the field, but an effect of projection is obtained either by recessing the whole space immediately surrounding the design, or by enclosing the latter in a scarped frame. Yet another and a very favourite method, giving beautiful results, is to model the design on both faces of the metal so as to give a sculpture in the round. This fashion is always accompanied by chiselling *à jour* (*sukashi-bori*), so that the sculptured portions stand out in their entirety.

Methods of chiselling.

Inlaying with gold or silver was among the early forms of decoration in Japan, but the skill developed in modern times is at least equal to anything which the past can show, and the results produced are much more imposing. There are two principal kinds of inlaying: the first called *hon-zogan* (true inlaying), the second *nunome-zogan* (linen-mesh inlaying). As to the former, the Japanese method does not differ from that seen in the beautiful iron censers and vases inlaid with gold which the Chinese produced from the *Shuntieh* era (1426–36). In the surface of the metal the workman cuts grooves wider at the base than at the top, and then hammers into them gold or silver wire. Such a process presents no remarkable features, except that it has been carried by the Japanese to an extraordinary degree of elaborateness. The *nunome-zogan* is more interesting. Suppose, for example, that the artist desires to produce an inlaid diaper. His first business is to chisel the surface in lines forming the basic pattern of the design. Thus, for a diamond-petal diaper the chisel is carried across the face of the metal horizontally, tracing a number of parallel bands divided at fixed intervals by ribs which are obtained by merely straightening the chisel and striking it a heavy blow. The same process is then repeated in another direction, so that the new bands cross the old at an angle adapted to the nature of the design. Several independent chisellings may be necessary before the lines of the diaper emerge clearly, but throughout the whole operation no measurement of any kind is taken, the artist being guided entirely by his hand and eye. The metal is then heated, not to redness, but sufficiently to develop a certain degree of softness, and the workman, taking a very thin sheet of gold (or silver), hammers portions of it into the salient points of the design. In ordinary cases this is the sixth process. The seventh is to hammer gold into the outlines of the diaper: the eighth, to hammer it into the pattern filling the spaces between the lines, and the ninth and tenth to complete the details. Of course the more intricate the design the more numerous the processes. It is scarcely possible to imagine a higher effort of hand and

Inlaying.

[1] It is first boiled in a lye obtained by lixiviating wood ashes; it is next polished with charcoal powder; then immersed in plum vinegar and salt; then washed with weak lye and placed in a tub of water to remove all traces of alkali, the final step being to digest in a boiling solution of copper sulphate, verdigris, and water.

eye than this *nunome-zogan* displays, for while intricacy and elaborateness are carried to the very extreme, absolute mechanical accuracy is obtained. Sometimes in the same design we see gold of three different hues, obtained by varying the alloy. A third kind of inlaying, peculiar to Japan, is *sumi-zogon* (ink-inlaying), so called because the inlaid design gives the impression of having been painted with Indian ink beneath the transparent surface of the metal. The difference between this process and ordinary inlaying is that for *sumi-zogan* the design to be inlaid is fully chiselled out of an independent block of metal with sides sloping so as to be broader at the base than at the top. The object which is to receive the decoration is then channelled in dimensions corresponding to those of the design block, and the latter having been fixed in the channel, the surface is ground and polished until absolute intimacy seems to be obtained between the inlaid design and the metal forming its field. Very beautiful effects are thus produced, for the design seems to have grown up to the surface of the metal field rather than to have been planted in it. *Shibuichi* inlaid with *shakudo* used to be the commonest combination of metals in this class of decoration, and the objects usually depicted were bamboos, crows, wild-fowl under the moon, peony sprays, and so forth.

Wood-grained grounds.

A variety of decoration much practised by early experts and carried to a high degree of excellence in modern times, is called *mokume-ji*, or wood-grained ground. The process in this case is to take a thin plate of iron—if iron is the metal to be treated—and beat it into another plate of similar metal, so that the two, though welded together, retain their separate forms. The mass, while still hot, is coated with *hena-tsuchi* (a kind of marl) and rolled in straw ash, in which state it is roasted over a charcoal fire raised to glowing heat with the bellows. The clay having been removed, another plate of metal is beaten in, and the same process is repeated. This is done several times, the number depending on the quality of graining that the expert desires to produce. The manifold plate is then heavily punched from one side, so that the opposite face protrudes in broken blisters, which are then hammered down until each becomes a centre of wave propagation. In fine work the apex of the blister is ground off before the final hammering. Iron was the metal used exclusively for work of this kind down to the 16th century, but various metals began thenceforth to be combined. Perhaps the choicest variety is gold graining in a *shakudo* field. By repeated hammering and polishing the expert obtains such control of the wood-grain pattern that its sinuosities and eddies seem to have developed symmetry without losing anything of their fantastic grace. There are other methods of producing *mokume-ji*, but their details may be omitted here.

Modern and ancient skill.

It has been frequently asserted by Western critics that the year (1876) which witnessed the abolition of sword-wearing in Japan, witnessed also the end of her artistic metal work. That is a great mistake. The art has merely developed new phases in modern times. Not only are its masters as skilled now as they were in the days of the Gotô, the Nara, the Yokoya, and the Yanagawa celebrities, but also their productions must be called greater in many respects and more interesting than those of their renowned predecessors. They no longer devote themselves to the manufacture of sword ornaments, but work rather at vases, censers, statuettes, plaques, boxes, and other objects of a serviceable or ornamental nature. All the processes described above are practised by them with full success, and they have added others quite as remarkable. Of these, one of the most interesting is called *kiribame* (insertion). The decorative design having been completely chiselled in the round, is then fixed in a field of a different metal, in which a design of exactly similar outline has been cut out *en bloc*. The result is that the picture has no blank reverse. For example, on the surface of a *shibuichi* box-lid we see the backs of a flock of geese chiselled in silver, and when the lid is opened, their breasts and the undersides of their pinions appear. The difficulty of such work is plain. Microscopic accuracy has to be attained in cutting out the space for the insertion of the design, and while the latter must be soldered firmly in its place, not the slightest trace of solder or the least sign of junction must be discernible between the metal of the inserted picture and that of the field in which it is inserted. Suzuki Gensuke is the inventor of this method. He belongs to a class of experts called *uchimono-shi* (hammerers) who perform preparatory work for glyptic artists in metal. The skill of these men is often wonderful. Using the hammer only, some of them can beat out an intricate shape as truly and delicately as a sculptor could carve it with his chisels. Ohori Masatoshi, an *uchimono-shi* of Aizu (died 1897), made a silver cake-box in the form of a sixteen-petalled chrysanthemum. The shapes of the body and lid corresponded so intimately that whereas the lid could be slipped on easily and smoothly without any attempt to adjust its curves to those of the body, it always fitted so closely that the box could be lifted by grasping the lid only. Another feat of his was to apply a lining of silver to a *shakudo* box by shaping and hammering only, the fit being so perfect that the lining clung like paper to every part of the box. Suzuki Gensuke and Hirata Sôkô are scarcely less expert. The latter once exhibited in Tôkyô a silver game-cock with soft plumage and surface modelling of the most delicate character. It had been made by means of the hammer only. Suzuki's *kiribame* process is not to be confounded with the *kiribame-zogan* (inserted inlaying) of Tôyôda Kokô, also a modern artist. The gist of the latter method is that a design chiselled *à jour* has its outlines veneered with other metal which serves to emphasize them. Thus, having pierced a spray of flowers in a thin sheet of *shibuichi*, the artist fits a slender rim of gold, silver, or *shakudo* into the petals, leaves, and stalks, so that an effect is produced of transparent blossoms outlined in gold, silver, or purple. Another modern achievement—also due to Suzuki Gensuke—is designated *maze-gane* (mixed metals). It is a singular conception, and the results obtained depend largely on chance. *Shibuichi* and *shakudo* are melted separately, and when they have cooled just enough not to mingle too intimately, they are cast into a bar which is subsequently beaten flat. The plate thus obtained shows accidental clouding, or massing of dark tones, and these patches are taken as the basis of a pictorial design to which final character is given by inlaying with gold and silver, and by *katakiri* sculpture. Such pictures partake largely of the impressionist character, but they attain much beauty in the hands of the Japanese artist with his extensive repertoire of suggestive symbols. A process resembling *maze-gane*, but less fortuitous, is *shibuichi-dôshi* (combined *shibuichi*), which involves beating together two kinds of *shibuichi* and then adding a third variety, after which the details of the picture are worked in as in the case of *maze-gane*. The charm of these methods is that certain parts of the decorative design seem to float, not on the surface of the metal, but actually within it, an admirable effect of depth and atmosphere being thus produced. Mention must also be made of an extraordinarily elaborate and troublesome process invented by Kajima Ippu, a really great artist of the present day. It is called *togi-dashi-zogan* (ground-out inlaying). In this exquisite and in-

genious kind of work—the technical details of which are too complicated to set down here—the design appears to be growing up from the depths of the metal, and a delightful impression of atmosphere and water is obtained. All these processes, as well as that of *repoussé*, in which the Japanese have excelled from a remote period, are now practised with the greatest skill in Tôkyô, Kyôtô, Osaka, and Kaga. At the art exhibitions held semi-annually in the principal cities there may be seen specimens of statuettes, alcove ornaments, and household utensils which reach a strikingly high level of ability, and show that the Japanese worker in metals stands more indisputably than ever at the head of the world's artists in that field. The Occident does not yet appear to have fully realized the existence of such talent in Japan, partly perhaps because its displays in former times were limited chiefly to sword-furniture, insignificant objects possessing little interest for the average European or American; and partly because the Japanese have not yet learned to adapt their skill to foreign requirements. They confine themselves at present to decorating plaques, boxes and cases for cigars or cigarettes, and an occasional tea or coffee service, but the whole domain of salvers, dessert-services, race-cups, and so on remains virtually unexplored. Only within the past few years have stores been established in the foreign settlements for the sale of silver utensils, and already the workmanship on these objects displays palpable signs of the deterioration which all branches of Japanese art have undergone in the attempt to cater for foreign taste. In the general sense the European or American is a much less exacting connoisseur than the Japanese. Broad effects of richness and splendour captivate the former, whereas the latter looks for delicacy of finish, accuracy of detail, and, above all, evidences of artistic competence. It is nothing to a Japanese that a vase should be covered with profuse decoration of flowers and foliage: he requires that every blossom and every leaf shall be instinct with vitality, and the comparative costliness of fine workmanship does not influence his choice. But if the Japanese sculptor adopted such standards in working for the *clientèle* which he finds in the foreign settlements, his market would be reduced to very narrow dimensions. He therefore adapts himself to his circumstances, and using the mould rather than the chisel, produces specimens which show tawdry handsomeness and are attractively cheap. It must be admitted, however, that even though the appreciative faculty were sufficiently educated on the foreign side, the Japanese artist in metals would still labour under a great difficulty, that of devising shapes to take the place of those which Europe and America have learned to consider classical.

Bronze casting. Bronze is called by the Japanese *kara-kane*, a term signifying "Chinese metal" and showing clearly the source from which knowledge of the alloy was obtained. It is a copper-lead-tin compound, the proportions of its constituents varying from 72 to 88 per cent. of copper, from 4 to 20 per cent. of lead, and from 2 to 8 per cent. of tin. There are also present small quantities of arsenic and antimony, and zinc is found generally as a mere trace, but sometimes reaching to 6 per cent. Gold is supposed to have found a place in ancient bronzes, but its presence has never been detected by analysis, and of silver not more than 2 per cent. seems to have been admitted at any time. Mr W. Gowland has shown that, whatever may have been the practice of Japanese bronze-makers in ancient and mediæval eras, their successors in later days deliberately introduced arsenic and antimony into the compound in order to harden the bronze without impairing its fusibility, so that it took a sharper impression of the mould. Japanese bronze is well suited for castings, not only because of its low melting-point, great fluidity, and capacity for taking sharp impressions, but also because it has a particularly smooth surface and readily develops a fine patina. One variety deserves special mention. It is a golden yellow bronze, called *sentoku*—this being the Japanese pronunciation of Shuntieh, the era of the Ming dynasty when this compound was invented. Copper, tin, lead, and zinc, mixed in various proportions by different experts, are the ingredients, and the beautiful golden hues and glossy texture of the surface are obtained by patina-producing processes, in which branch of metal work the Japanese show altogether unique skill.

From the time when they began to cast bronze statues, Japanese experts understood how to employ a hollow, removable core round which the metal was run in a skin just thick enough for strength without waste of material; and they also understood the use of wax for modelling purposes. In ordinary circumstances, a casting thus obtained took the form of a shell without any break of continuity. But for very large castings the process had to be modified. The great image of Lochana Buddha at Nara, for example, would measure 138 feet in height were it standing erect, and its weight is about 550 tons. The colossal Amida at Kamakura has a height only 3 feet less. It would have been scarcely possible to cast such statues in one piece *in situ*, or, if cast elsewhere, to transport them and elevate them on their pedestals. The plan pursued was to build them up gradually in their places by casting segment after segment. Thus, for the Nara *Dai Butsu*, the mould was constructed in a series of steps ascending 12 inches at a time, until the head and neck were reached, which, of course, had to be cast in one shell, 12 feet high.

The term "parlour bronzes" serves to designate objects for domestic use, as flower-vases, incense-burners, and alcove ornaments. To the manufacture of these objects bronze-casters began to turn their attention about the middle of the 17th century. Not until that epoch did the art of casting bronze become so refined and delicate that its products could rank with the forged and chiselled works of earlier eras, and it is generally supposed to have reached its culmination in the hands of a group of great experts—Seimin, Tôun, Masatune, Teijô, Sômin, Keisai, Takusai, Gido, Zenriusai, and Hotokusai—who flourished during the second half of the 18th century and the first half of the 19th. Many brilliant specimens of these men's work survive, their general features being that the motives are naturalistic, that the quality of the metal is exceptionally fine, that in addition to beautifully clear casting obtained by highly skilled use of the *cera-perduta* process, the chisel was employed to impart delicacy and finish to the design, and that modelling in high relief is most successfully introduced. But it is a mistake to assert, as many have asserted, that after the era of the above ten masters—the latest of whom, Sômin, ceased to work in 1871—no bronzes comparable with theirs were cast. Between 1875 and 1879 some of the finest bronzes, probably the very finest of their kind ever produced in Japan, were turned out by a group of experts working in combination under the firm name of "Sanseisha." Started by two brothers, Oshima Katsujiro (art-name Jôun), and Oshima Yasutaro (art-name Shôkaku), this association secured the services of a number of skilled chisellers of sword-furniture, who had lost their *métier* owing to the abandonment of the sword-wearing custom. Nothing could surpass the delicacy of the works executed at the Sanseisha's atelier in Tôkyô, but unfortunately such productions were above the standard of the customers for whom they were intended. Foreign buyers, who alone stood in the market at that time, failed to distinguish the

fine and costly bronzes of Jôun, Shôkaku, and their colleagues from cheap imitations which soon began to compete with them, so that ultimately the Sanseisha had to be closed. This page in the modern history of Japan's bronzes needs little alteration to become true of her applied art in general. Foreign demand has shown so little discrimination that experts, finding it impossible to obtain adequate remuneration for first-class work, have been obliged to abandon the field altogether, or to lower their standard to the level of general appreciation, or, by forgery, to cater for the perverted taste which attaches unreasoning value to age. Jôun has produced, and is thoroughly capable of producing, bronzes at least equal to the best of Seimin's masterpieces, yet he has often been induced to put Seimin's name on objects for the sake of attracting buyers who attach more value to cachet than to quality. If to the names of Jôun and his brilliant pupil Riuki we add those of Suzuki Chôkichi, Okazaki Sessei, Hasegawa Kumazo, Kanaya Gorosaburo, and Jômi Eisuke, we have a group of modern bronze-casters who unquestionably surpass the ten experts beginning with Seimin and ending with Sômin. Okazaki Sessei has successfully achieved a task previously beyond the strength of his country's experts, the casting of huge panels carrying designs in high relief; and whether there is question of patina or of workmanship, Jômi Eisuke has never been surpassed.

Occidental influence has been felt, of course, in the field of modern bronze-casting. At a school of art officially established in Tôkyô in 1873 under the direction of Italian teachers—a school which owed its signal failure partly to the incompetence and intemperate behaviour of some of its foreign professors, partly to a strong renaissance of pure Japanese classicism—one of the few accomplishments successfully taught was that of modelling in plaster and chiselling in marble after Occidental methods. Marble statues are out of place in the wooden buildings as well as in the parks of Japan, and even plaster busts or groups, though less incongruous perhaps, have not yet found favour. Hence the skill undoubtedly possessed by several graduates of the defunct art school has to be devoted chiefly to a subordinate purpose, namely, the fashioning of models for metal-casters. To this combination of modellers in European style and metal-workers of such force as Suzuki and Okazaki, Japan owes various memorial bronzes and likeness effigies which are gradually finding a place in her parks, her museums, her shrines, or her private houses. There is here little departure from the well-trodden paths of Europe. Studies in drapery, prancing steeds, ideal poses, heads with fragments of torsos attached (in extreme violation of true art), crouching beasts of prey—all the stereotyped styles are reproduced. The imitation is excellent. That is all that can yet be said, though some of these works suggest that Japanese artists will by and by attain distinction in the new field.

Occidental influence.

Wood and Ivory Carving.—Among the artists of early times it is often perplexing to distinguish between the carver of wood and the caster of bronze. The latter sometimes made his own models in wax, sometimes chiselled them in wood, and sometimes had recourse to a specialist in wood-carving. The group of splendid sculptors in wood that graced the 11th, 12th, and 13th centuries left names never to be forgotten, but undoubtedly many other artists of scarcely less force regarded bronze-casting as their principal business. Thus the story of wood-carving is very difficult to trace. Even in the field of architectural decoration for interiors, tradition tells us scarcely anything about the masters who carved such magnificent works as those seen in the Kyôtô temples, the Tokugawa mausolea, and some of the old castles. There are, however, no modern developments of such work to be noted. The ability of former times exists and is exercised in the old way, though the field for its employment has been greatly narrowed.

When Japanese sculpture in wood or ivory is spoken of, the first idea that presents itself is connected with the *nétsuké*, which, of all the art objects found in Japan, is perhaps the most essentially Japanese. If Japan had given us nothing but the *nétsuké*, we should still have no difficulty in differentiating the bright versatility of her national genius from the comparatively sombre, mechanic, and unimaginative temperament of the Chinese. But the *nétsuké* may now be said to be a thing of the past. The *inro* (medicine-box), which it served to fix in the girdle, has been driven out of fashion by the new civilization imported from the West, and artists who would have carved *nétsuké* in former times now devote their chisels to statuettes and alcove ornaments. It is not to be inferred, however, though it is a favourite assertion of collectors, that no good *nétsuké* have been made in modern times. That theory is based upon the fact that after the opening of the country to foreign intercourse in 1857, hundreds of inferior specimens of *nétsuké*—ceasing on the one hand to be valued by the Japanese themselves, and becoming on the other objects of curiosity and admiration to foreigners—were chiselled by inexpert hands, purchased wholesale by treaty-port merchants, and sent to New York, London, and Paris, where, though they brought profit to the exporter, they also disgusted the connoisseur and soon earned discredit for their whole class. But in fact the glyptic artists of Tôkyô, Osaka, and Kyôtô, though, as has been said above, they now devote their chisels chiefly to works of more importance than the *nétsuké*, are in no sense inferior to their predecessors of feudal days, and many beautiful *nétsuké* bearing their signatures are in existence. As for the modern ivory statuette or alcove ornament, of which great numbers are now carved for the foreign market, it certainly stands on a plane much higher than the *nétsuké*, since anatomical defects, which escape notice in the latter owing to its diminutive size, become painfully obtrusive in the former. It may confidently be said, therefore, of the modern Japanese sculptor in ivory that since, on the whole, he succeeds in avoiding such defects, he is a greater artist than the *nétsuké*-carver of former times.

Nétsuké-*carvers.*

One of the most remarkable developments of figure sculpture in former Japan was due to Matsumoto Kisaburo (1830–69). He carved human figures with as much accuracy as though they were destined for purposes of surgical demonstration. Considering that this man had neither art education nor anatomical instruction, and that he never enjoyed an opportunity of studying from a model in a studio, his achievements were remarkable. He and the craftsmen of the school he established completely refute the theory that the anatomical solecisms commonly seen in the works of Japanese sculptors are due to faulty observation. Without scientific training of any kind Matsumoto and his followers produced works in which the eye of science cannot detect any error. But it is impossible to admit within the circle of high-art productions these wooden figures of everyday men and women, unrelieved by any subjective element, and owing their merit entirely to the fidelity with which their contours are shaped, their muscles modelled, and their anatomical proportions preserved. They have not even the attraction of being cleanly sculptured in wood, but are covered with thinly lacquered muslin, which, though doubtless a good preservative, accentuates their puppet-like character. Nevertheless, Matsumoto's figures marked an epoch in Japanese wood

The realistic departure.

sculpture. Their vivid realism appealed strongly to the taste of the average foreigner. A considerable school of carvers soon began to work in the Matsumoto style, and hundreds of their productions have gone to Europe and America, finding no market in Japan.

The semi-foreign school.

Midway between the Matsumoto school and the pure style approved by native taste in former times stand a number of wood-carvers headed by Takamura Kôun, who occupies in the field of sculpture much the same place as that held by Hashimoto Gaho in the realm of painting. Kôun carves figures in the round which not only display great power of chisel and breadth of style, but also tell a story not necessarily drawn from the motives of the classical school. This departure from established canons must be traced to the influence of the short-lived academy of Italian art established by the Japanese Government early in the *Meiji* era. In the forefront of the new movement are to be found men like Yoneharu Unkai and Shinkai Taketaro, the former of whom chiselled a figure of Jenner for the Medical Association of Japan when they celebrated the centenary of the great physician, and the latter has carved life-size effigies of two Imperial princes who lost their lives in the war with China (1894–95). The artists of the Kôun school, however, do much work which appeals to emotions in general rather than to individual memories. Thus Arakawa Reiun, one of Kôun's most brilliant pupils, exhibited a figure of a swordsman in the act of driving home a furious thrust. The weapon is not shown. Reiun sculptured simply a man poised on the toes of one foot, the other foot raised, the arm extended, and the body straining forward in strong yet elastic muscular effort. This carving emphasizes the advantage of not working from a model. A posed figure could not possibly suggest the alert vitality and high muscular tension of the swordsman. A more imaginative work by the same artist is a figure of a farmer who has just shot an eagle that swooped upon his grandson. The old man holds his bow still raised. Some of the eagle's feathers, blown to his side, suggest the death of the bird; at his feet lies the corpse of the little boy, and the horror, grief, and anger that such a tragedy would inspire are depicted with striking realism in the farmer's face. Such work has very close affinities with Occidental conceptions. The chief distinguishing feature is that the glyptic character is preserved at the expense of surface finish. The undisguised touches of the chisel tell a story of technical force and directness which could not be suggested by perfectly smooth surfaces. To subordinate process to result is the European canon; to show the former without marring the latter is the Japanese ideal. Many of Kôun's sculptures appear unfinished to eyes trained in Occidental galleries, whereas the Japanese connoisseur detects evidence of a technical feat in their seeming roughness.

Textile Fabrics.—In no branch of applied art does the decorative genius of Japan show more attractive results than in that of textile fabrics, and in none has there been more conspicuous progress during recent years. Her woven and embroidered stuffs have always been beautiful; but in former times few pieces of size and splendour were produced, if we except the curtains used for draping festival cars and the hangings of temples. Tapestry, as it is employed in Europe, was not thought of, nor indeed could the small hand-looms of the period be easily adapted to such work. All that has been changed, however. Arras of large dimensions, showing remarkable workmanship and grand combinations of colours, is now manufactured in Kyôtô, the product of years of patient toil on the part of weaver and designer alike. Kawashima of Kyôtô has acquired high reputation for work of this kind. He inaugurated the new departure a few years ago by copying a Gobelin, but it may safely be asserted that no Gobelin will bear comparison with the pieces now produced in Japan. The most approved fashion of weaving is called *tsuzure-ori* (linked-weaving); that is to say, the cross threads are laid in with the fingers and pushed into their places with a comb by hand, very little machinery being used. The threads extend only to the outlines of each figure, and it follows that every part of the pattern has a rim of minute holes like the pierced lines separating postage stamps in a sheet, the effect being that the design seems to hang suspended in the ground—linked into it, as the Japanese term implies.[1] A specimen of this nature recently manufactured by Kawashima's weavers measured 20 feet by 13 feet, and represented the annual festival at the Nikkô mausolea. The chief shrine was shown; the gate and long flight of stone steps leading up to it, several other buildings, the groves of cryptomeria that surround the mausolea, and the festival procession. All the architectural and decorative details, all the carvings and colours, all the accessories—everything was wrought in silk, and each of the 1500 figures forming the procession wore exactly appropriate costume. Even this wealth of detail, remarkable as it was, seemed less surprising than the fact that the weaver had succeeded in producing the effect of atmosphere and aërial perspective. Through the graceful cryptomeria distant mountains and the still more distant sky could be seen, and between the buildings in the foreground and those in the middle distance atmosphere appeared to be perceptible. Two years of incessant labour with relays of artisans working steadily throughout the twenty-four hours were required to finish this piece. Naturally such specimens are not produced in large numbers. Next in decorative importance to *tsuzure-ori* stands *yuzen birôdo*, commonly known among English-speaking people as "cut velvet." Dyeing by the *yuzen* process is an innovation of modern times. The design is painted on the fabric, after which the latter is steamed, and the picture is ultimately fixed by methods which are kept secret. The soft silk known as *habutaye* is a favourite ground for such work, but silk crape also is largely employed. No other method permits the decorator to achieve such fidelity and such boldness of draughtsmanship. The difference between the results of the ordinary and the *yuzen* processes of dyeing is, in fact, the difference between a stencilled sketch and a finished picture. In the case of "cut velvet," the *yuzen* process is supplemented by an operation which can be easily described. The cutter, who works at an ordinary wooden bench, has no tool except a small sharp chisel with a V-shaped point. This chisel is passed into an iron pencil having at the end guards, between which the point of the chisel projects, so that it is impossible for the user to cut beyond a certain depth. When the velvet comes to him, it already carries a coloured picture permanently fixed by the *yuzen* process, but the wires have not been withdrawn. It is, in fact, velvet that has passed through all the usual stages of manufacture except the cutting of the thread along each wire and the withdrawal of the wires. The cutting artist lays the piece of this unfinished velvet before him on his bench, and proceeds to carve into the pattern with his chisel, just as though he were shading the lines of the design with a steel pencil. When the pattern is lightly traced, he uses his knife delicately; when the lines are strong and the shadows heavy, he makes the point pierce deeply. In short, the little chisel becomes in his fingers a painter's brush, and when it is remembered that, the basis upon which he works

[1] This method is some 300 years old. It is by no means a modern invention, as some writers have asserted.

being simply a thread of silk, his hand must be trained to such delicacy of muscular effort as to be capable of arresting the edge of the knife at varying depths within the diameter of the tiny filament, the difficulty of the achievement will be understood. Of course it is to be noted that the edge of the cutting tool is never allowed to trespass upon a line which the exigencies of the design require to be solid. The veining of a cherry petal, for example, the tesselation of a carp's scales, the serration of a leaf's edge —all these lines remain intact, spared by the cutter's tool, while the leaf itself, or the petal, or the scales of the fish, have the threads forming them cut so as to show the velvet nap and to appear in soft, low relief. In one variety of this fabric, a slip of gold foil is laid under each wire, and left in position after the wire is withdrawn, the cutting tool being then used with freedom in some parts of the design, so that the gold gleams through the severed thread, producing a rich and suggestive effect. Velvet, however, is not capable of being made the basis for pictures so elaborate and microscopially accurate as those produced by the *yuzen* process on silk crape or *habutaye*. The rich-toned, soft plumage of birds or the magnificent blending of colours in a bunch of peonies or chrysanthemums cannot be obtained with absolute fidelity on the ribbed surface of velvet.

Embroidery.

The embroiderer's craft has been followed for centuries in Japan with eminent success, but whereas it formerly ranked with dyeing and weaving, it has now come to be regarded as an art. Formerly the embroiderer was content to produce a pattern with his needle, now he paints a picture. The statement is not an exaggeration. So perfectly does the modern Japanese embroiderer elaborate his scheme of values that all the essential elements of pictorial effects—chiaroscuro, aërial perspective, and atmosphere—are present in his work. Thus a graceful and realistic school has replaced the comparatively stiff and conventional style of former times. Further, an improvement of a technical character was recently made, which has the effect of adding greatly to the durability of these embroideries. Owing to the use of paper among the threads of the embroidery and sizing in the preparation of the stuff forming the ground, every operation of folding used to cause perceptible injury to a piece, so that after a few years it acquired a crumpled and dingy appearance. But by the new method embroiderers now succeed in producing fabrics which defy all destructive influences except, of course, dirt and decay.

Keramics.—Speaking broadly, the distinguished products of Japanese keramic art in pre-*Meiji* days may be said to have been the porcelains of Hizen and Kutani and the faiences of Satsuma and Kyôtô. Many other wares have attracted attention, but though not without merits and even beauties, they are comparatively insignificant.

Oriental Pottery.

In the term "Hizen porcelains" are included not merely the richly decorated Imari ware—the "Old Japan" of Western collectors—but also the finely modelled and delicately coloured masterpieces of Hirado, and the jewelled specimens of Nabeshima, which undoubtedly stand at the head of all Japanese porcelains ornamented with vitrifiable enamels over the glaze. Many examples of these varieties deserve the enthusiastic admiration they have received, yet they unquestionably belong to a lower rank of keramic achievements than the choice productions of Chinese kilns. The potters of the Middle Kingdom, from the early eras of the Ming dynasty down to the latest years of the 18th century, stood absolutely without rivals—*haud æqui aut secundi*—as makers of porcelain. Their technical ability was incomparable—though in grace of decorative conception they yielded the palm to the Japanese—and the representative specimens they bequeathed to posterity remained, until quite recently, far beyond the imitative capacity of European or Asiatic experts. As for faience and pottery, however, the Chinese despised them in all forms, with one notable exception, the *Yishing-yao*, known in the Occident as *boccaro*. Even the *Yishing-yao*, too, owed much of its popularity to special utility. It was essentially the ware of the tea-drinker. If in the best specimens exquisite modelling, wonderful accuracy of finish, and *pâtes* of interesting tints are found, such pieces are, none the less, stamped prominently with the character of utensils rather than with that of works of art. In short, the artistic output of Chinese kilns in their palmiest days was, not faience or pottery, but porcelain, whether of soft or hard paste. Japan, on the contrary, owes her keramic distinction in the main to her faience. A great deal has been said by enthusiastic writers about the *Famille Chrysanthemo-Péonienne* of Imari and the *Genre Kakiemon* of Nabeshima, but these porcelains, beautiful as they undoubtedly are, cannot be placed on the same level with the *Kwan-yao* and *Famille Rose* of the Chinese experts. The Imari ware, even though its thick biscuit and generally ungraceful shapes be omitted from the account, shows no enamels that can rival the exquisitely soft, broken tints of the *Famille Rose;* and the *Kakiemon* porcelain, for all its rich though chaste contrasts, lacks the delicate transmitted tints of the shell-like *Kwan-yao*. So, too, the blue-and-white porcelain of Hirado, though assisted by exceptional tenderness of *sous-pâte* colour, by milk-white glaze, by great beauty of decorative design, and often by an admirable use of the modelling or graving tool, represents a keramic achievement palpably below the soft paste *Kai-pien-yao* of Ching-tê-chêng. It is a curious and interesting fact that this last product of Chinese skill remained unknown in Japan down to very recent days. In the eyes of a Chinese connoisseur, no blue-and-white porcelain worthy of consideration exists, or ever has existed, except the *Kai-pien-yao*, with its imponderable *pâte*, its wax-like surface, and its rich, glowing blue, entirely free from superficiality or garishness, and broken into a thousand tints by the microscopic crackle of the glaze. The Japanese, although they obtained from their neighbour almost everything of value she had to give them, did not know this wonderful ware, and their ignorance is in itself sufficient to prove their keramic inferiority. There remains, too, a wide domain in which the Chinese developed high skill, whereas the Japanese can scarcely be said to have entered it at all; namely, the domain of monochromes and polychromes, striking every note of colour from the richest to the most delicate; the domain of *truité* and *flambé* glazes, of "transmutation ware" (*Yô-pien-yao*), and of egg-shell with incised or translucid decoration. In all that region of achievement the Chinese potters stood alone and seemingly unapproachable. The Japanese, on the contrary, made a speciality of faience, and in that particular line they reached a high standard of excellence. No faience produced either in China or any other Oriental country can dispute the palm with really representative specimens of Satsuma ware. Not without full reason have Western connoisseurs lavished panegyrics upon that exquisite production. The faience of the Kyôtô artists never reached quite to the level of the Satsuma in quality of *pâte* and glowing mellowness of decoration: their materials were slightly inferior. But their skill as decorators was as great as its range was wide, and they produced a multitude of masterpieces on which alone Japan's keramic fame might safely be rested.

Such, briefly speaking, had been the story of the art and the distinction between the methods of its practice in China and Japan until the commencement of a new era

in the latter country. When the mediatization of the fiefs, in 1871, terminated the local patronage hitherto extended so munificently to keramic and other artists, the Japanese gradually learned that they must thenceforth depend chiefly upon the markets of Europe and America. They had to appeal, in short, to an entirely new "gallery," and how to secure its approval was to them a perplexing problem. Having little to guide them, they often interpreted Western taste incorrectly, and impaired their own reputation in a corresponding degree. Indeed, it may truly be said that the urgent need of Japan even at present is some intelligent appreciation of foreign wants. Just as her metal-workers devote themselves to the production of cigar-boxes, plaques, and other objects falling within the pecuniary reach of a very small circle of buyers, so her keramists confine their efforts to vases, censers, and more rarely tea and coffee services, this last class of commodities being too often disfigured by some unsightliness of form or clumsiness of design. What has to be considered here, however, is not the business aspect of the question, but rather the gradual steps of technical progress by which the present stage has been reached. In the early years of the *Meiji* era there was a period of complete prostitution. No new skill was developed, and what remained of the old was expended chiefly upon the manufacture of meretricious objects, disfigured by excess of decoration and not relieved by any excellence of technique. In spite of their artistic defects, these specimens were exported in considerable numbers by merchants in the foreign settlements, and their first cost being very low, they found a not unremunerative market. But as European and American collectors became better acquainted with the capacities of the pre-*Meiji* potters, the great inferiority of these new specimens was recognized, and the prices commanded by the old wares gradually appreciated. What then happened was very natural: imitations of the old wares were produced, and having been sufficiently disfigured by staining and other processes calculated to lend an air of rust and age, were sold to ignorant persons, who laboured under the singular yet common hallucination that the points to be looked for in specimens from early kilns were, not technical excellence, decorative tastefulness, and richness of colour, but dinginess, imperfections, and dirt; persons who imagined, in short, that defects which they would condemn at once in new porcelains ought to be regarded as merits in old. Of course a trade of that kind, based on deception, could not have permanent success. One of the imitators of "old Satsuma" was among the first to perceive that a new line must be struck out. Yet the earliest results of his awakened perception helped to demonstrate still further the depraved spirit that had come over Japanese art. For he applied himself to manufacture wares having a close affinity with the shocking monstrosities used for sepulchral purposes in ancient Apulia, where fragments of dissected satyrs, busts of nymphs, or halves of horses were considered graceful excrescences for the adornment of an amphora or a pithos. This Makuzu faience, produced by the now justly celebrated Miyagawa Shôzan of Ota (near Yokohama), survives in the form of vases and pots having birds, reptiles, flowers, crustacea, and so forth plastered over the surface—specimens that disgrace the period of their manufacture, and represent probably the worst aberration of Japanese keramic conception.

Change of style after the Restoration.

Adoption of Chinese models.

A production so degraded as the early Makuzu faience could not possibly have long vogue. Miyagawa soon began to cast about for a better inspiration, and found it in the monochromes and polychromes of the Chinese *Kang-hsi* and *Yung-cheng* kilns. The extraordinary value attaching to the incomparable red glazes of China, not only in the country of their provenance but also in the United States of America, where collectors showed a fine instinct in this matter, seems to have suggested to Miyagawa the idea of imitation. He took for model the rich and delicate "liquid-dawn" monochrome, and succeeded in producing, not indeed a rival of that grand ware, but at any rate some specimens of considerable merit. Thenceforth his example was largely followed, and it may now be said that the tendency of many of the best Japanese keramists is to copy Chinese *chefs-d'œuvre*. To find them thus renewing their keramic reputation by reverting to Chinese models, is not only another tribute to the perennial supremacy of Chinese porcelains, but also a fresh illustration of the eclectic genius of Japanese art. All the products of this new effort are porcelains proper. It is not intended to suggest that beautiful faience has ceased to be a Japanese speciality. The Kyôtô potters still tread successfully in the old grooves. But the question here is of a novel departure which distinguishes the present era. Seven kilns are devoted, wholly or in part, to the new wares: namely, that of Miyagawa Shôzan of Ota, that of Seifû Yôhei of Kyôtô, those of Takemoto Hayata and Kato Tomojiro of Tôkyô, that of Higuchi Haruzane of Hirado, that of Shida Yasukyo of Kaga, and that of Kato Masukichi of Seto.

Seifû of Kyôtô.

Among the seven keramists here enumerated, Seifû of Kyôtô probably enjoys the highest reputation. If we except the ware of Satsuma, a unique product, it may be said that nearly all the fine faience of Japan was manufactured formerly in Kyôtô. Nomura Ninsei, in the middle of the 17th century, inaugurated a long era of beautiful productions with his cream-like, "fish-roe" *craquelé* glazes, carrying rich decoration of clear and brilliant vitrifiable enamels. It was he who gave their first really artistic impulse to the kilns of Awata, Mizoro, and Iwakura, whence so many delightful specimens of faience issued almost without interruption until the middle of the 19th century and continue to issue to-day. The three Kenzan—of whom the third died in 1820; Ebisei; the four Dôhachi, of whom the fourth is still alive; the Kagiya family, manufacturers of the celebrated *Kinkôzan* ware; Hôzan, whose imitations of Delft faience and his *pâte-sur-pâte* pieces with fern-scroll decoration remain incomparable; Taizan Yôhei, whose ninth descendant of the same name now produces fine specimens of Awata ware for foreign markets; Tanzan Yôshitaro and his son Rokuro, to whose credit stands a new departure in the form of faience having *pâte-sur-pâte* decoration of lace patterns, diapers and archaic designs executed in low relief with admirable skill and minuteness; the two Bizan, renowned for their representations of richly-apparelled figures as decorative motives; Rokubei, who studied painting under Maruyama Okyo and followed the naturalistic style of that great artist; Mokubei, the first really expert manufacturer of translucid porcelain in Kyôtô; Shuhei, Kintei, and above all, Zengoro Hôzen, the celebrated potter of *Eiraku* wares—these names and many others give to Kyôtô keramics an eminence as well as an individuality which few other wares of Japan can boast. Nor is it to be supposed that the ancient capital now lacks great potters. Okamura Yasutaro, commonly called Shôzan, produces specimens which only a very acute connoisseur can distinguish from the work of Nomura Ninsei; Tanzan Rokuro's half-tint enamels and soft creamy glazes would have stood high in any epoch; Taizan Yôhei produces Awata faience not inferior to that of former days; Kagiya Sôbei worthily supports the reputation of the *Kinkôzan* ware; Kawamoto Eijiro has made to the order of a well-known Kyôtô firm

many specimens now figuring in foreign collections as old masterpieces; and Ito Tôzan succeeds in decorating faience with seven colours *sous couverte* (black, green, blue, russet-red, tea-brown, purple, and peach), a feat never before accomplished. It is therefore an error to assert, as has been so often asserted, that Kyôtô has no longer a title to be called a great keramic centre if estimated by old-time standards. Seifû Yôhei, however, has the special faculty of manufacturing monochromatic and jewelled porcelain and faience, which differ essentially from the traditional Kyôtô types, their models being taken directly from China. But a sharp distinction has to be drawn between the method of Seifû and that of the other six keramists mentioned above as following Chinese fashions. It is this, that whereas the latter produce their chromatic effects by mixing the colouring matter with the glaze, Seifû paints the biscuit with a pigment over which he runs a translucid colourless glaze. The Kyôtô artist's process is much easier than that of his rivals, and although his monochromes are often of most pleasing delicacy and fine tone, they do not belong by any means to the same category of technical excellence as the wares they imitate. From this judgment must be excepted, however, his ivory-white and *céladon* wares, as well as his porcelains decorated with blue, or blue and red *sous couverte*, and with vitrifiable enamels over the glaze. In these five varieties he is emphatically great. It cannot be said, indeed, that his *céladon* shows the velvety richness of surface and tenderness of colour that distinguished the old *Kuang-yao* and *Lungchuan-yao* of China, or that he has ever essayed the moss-edged crackle of the beautiful *Ko-yao*. But his *céladon* certainly equals the more modern Chinese examples from the *Kang-hsi* and *Yung-cheng* kilns. As for his ivory-white, it distinctly surpasses the Chinese Ming *Chen-yao* in every quality except an indescribable intimacy of glaze and *pâte* which probably can never be obtained by either Japanese or European methods.

Miyagawa Shôzan.

Miyagawa Shôzan, or Makuzu, as he is generally called, has never followed Seifû's example in descending from the difficult manipulation of coloured glazes to the comparatively simple process of painted biscuit. This comment does not refer, it need scarcely be said, to the use of blue and red *sous couverte*. In that class of beautiful ware the application of pigment to the unglazed *pâte* is inevitable, and both Seifû and Miyagawa, working on the same lines as their Chinese predecessors, produce porcelains that almost rank with choice *Kang-hsi* specimens, though they have not yet mastered the processes sufficiently to employ them in the manufacture of large imposing pieces or wares of moderate price. But in the matter of true monochromatic and polychromatic glazes, to Shôzan belongs the credit of having inaugurated Chinese fashions, and if he has never fully succeeded in achieving *Lang-yao* (*sang-de-bœuf*), *Chi-hung* (liquid-dawn red), *Chiang-tou-hung* (bean-blossom red, the "peach-blow" of American collectors), or above all *Pin-kwo-tsing* (apple-green with red bloom), his efforts to imitate them have resulted in some very interesting pieces.

Tôkyô keramists.

Takemoto and Kato of Tôkyô entered the field subsequently to Shôzan, but follow the same models approximately. Takemoto, however, has made a speciality of black glazes, his aim being to rival the *Sung Chien-yao*, with its glaze of mirror-black or raven's-wing-green, and its leveret-fur streaking or russet-moss dappling, the prince of all wares in the estimation of the Japanese tea-clubs. Like Shôzan, he is still very far from his original, but, also like Shôzan, he produces highly meritorious pieces in his efforts to reach an ideal that will probably continue to elude him for ever. Of Kato there is not much to be said. He has not succeeded in winning great distinction, but he manufactures some very delicate monochromes, fully deserving to be classed among prominent evidences of the new departure. Tôkyô was never a centre of keramic production. Even during the 300 years of its conspicuous prosperity as the administrative capital of the Tokugawa Shoguns, it had no noted factories, doubtless owing to the absence of any suitable potter's clay in the immediate vicinity. Its only notable production of a keramic character was the work of Miura Kenya (1830–43), who followed the methods of the celebrated Haritsu (1688–1704) of Kyôtô in decorating plain or lacquered wood with mosaics of *Raku* faience having coloured glazes. Kenya was also a skilled modeller of figures, and his factory in the Imado suburb obtained a considerable reputation for work of that nature. He was succeeded by Tozawa Benshi, now an old man of over seventy, who, using clay from Owari or Hizen, has turned out many porcelain statuettes of great beauty. But although the capital of Japan formerly played only an insignificant part in Japanese keramics, modern Tôkyô has an important school of artist-artisans. Every year large quantities of porcelain and faience are sent from the provinces to the capital to receive surface decoration, and in wealth of design as well as carefulness of execution the results are praiseworthy. But of the pigments employed nothing very laudatory could be said until very recent times. They were generally crude, of impure tone, and without depth or brilliancy. Now, however, they have lost these defects and entered a period of considerable excellence. As for the nature of the designs, it may fairly be said that figure-subjects constitute their chief feature. A majority of the artists are content to copy old pictures of Buddha's Sixteen Disciples, the Seven Gods of Happiness, and other similar assemblages of mythical or historical personages, not only because such work offers large opportunity for the use of striking colours and the production of meretricious effects, dear to the eye of the average Western householder and globe-trotter, but also because a complicated design, as compared with a simple one, has the advantage of hiding the technical imperfections of the ware. Of late there have happily appeared some decorators who prefer to choose their subjects from the natural field in which their great predecessors of former times excelled, and there is reason to hope that this more congenial and more pleasing style will supplant its modern usurper. The best known factory in Tôkyô for decorative purposes is the Hyôchi-en. It was established in the Fukagawa suburb in 1875, with the immediate object of preparing specimens for the first Tôkyô Exhibition held at that time. Its founders obtained a measure of official aid, and were able to secure the services of some good artists, among whom may be mentioned Obanawa and Shimauchi. The porcelains of Owari and Arita naturally received most attention at the hands of the Hyôchi-en decorators, but there was scarcely one of the principal wares of Japan upon which they did not try their skill, and if a piece of monochromatic Minton or Sèvres came in their way, they undertook to improve it by the addition of designs copied from old masters or suggested by modern taste. To all such pieces the cachet of the Fukagawa atelier was indiscriminately applied, and has probably proved a source of considerable confusion to collectors. Many other factories for decoration were established from time to time in Tôkyô. Of these some still exist; others, ceasing to be profitable, have been abandoned. On the whole, the industry may now be said to have assumed a domestic character. In a house, presenting no distinctive features whatsoever, one finds the decorator with a cupboard full of bowls and vases in

glazed biscuit, which he adorns, piece by piece, using the simplest conceivable apparatus and a meagre supply of pigments. Sometimes he fixes the decoration himself, employing for that purpose a small kiln which stands in his back garden; sometimes he entrusts this part of the work to a factory where greater facilities are provided. As in the case of everything Japanese, there is no pretence, no useless expenditure about the process. Yet it is plain that this school of Tôkyô decorators, though often choosing their subjects badly, have contributed much to the progress of the keramic art during the past few years. Little by little there has been developed a degree of skill which compares not unfavourably with the work of the old masters. Table services of Owari porcelain—the ware itself excellently manipulated and of almost egg-shell fineness—are now decorated with floral scrolls, landscapes, insects, birds, figure-subjects, and all sorts of designs, chaste, elaborate, or quaint; and these services, representing so much artistic labour and originality, are sold for prices that bear no due ratio to the skill required in their manufacture. There is only one reservation to be made in speaking of the modern decorative industry of Japan under its better aspects. It is a reservation applying equally to the work done in Tôkyô, Kyôtô, Yokohama, and Kobe, in all of which places decorating ateliers (*etsuke-dokoro*), similar to those of Tôkyô, have been established in modern times: the artists use chiefly pigments, seldom venturing to employ vitrifiable enamels. That the results achieved with these different materials are not comparable is a fact which every connoisseur must admit. The glossy surface of a porcelain glaze is ill fitted for rendering artistic effects with ordinary colours. The proper field for the application of these is the biscuit, in which position the covering glaze serves at once to soften and to preserve the pigment. It can scarcely be doubted that the true instincts of the keramist will ultimately counsel him to confine his decoration over the glaze to vitrifiable enamels, with which the Chinese and Japanese potters of former times obtained such brilliant results. But to employ enamels successfully is an achievement demanding special training and materials not easy to procure or to prepare. The Tôkyô decorators are not likely, therefore, to change their present methods immediately. An impetus was given to keramic decoration by the efforts of a new school, which owed its origin to Dr G. Wagener, an eminent German expert formerly in the service of the Japanese Government. Dr Wagener conceived the idea of developing the art of decoration under the glaze, as applied to faience. Faience thus decorated has always been exceptional in Japan. Rare specimens were produced in Satsuma and Kyôtô, the colour employed being chiefly blue, though brown and black were used in very exceptional instances. The difficulty of obtaining clear, rich tints was nearly prohibitive, and though success, when achieved, seemed to justify the effort, this class of ware never received much attention in Japan. By careful selection and preparation of *pâte*, glaze, and pigments, Dr Wagener proved not only that the manufacture was reasonably feasible, but also that decoration thus applied to pottery possesses unique delicacy and softness. Ware manufactured by his direction at the Tôkyô School of Technique (*Shokkô Gakkô*), under the name of *Asahi-yaki*, ranks among the interesting productions of modern Japan. The decorative colour chiefly employed is chocolate brown, which harmonizes excellently with the glaze. But the ware has never found favour in Japanese eyes, an element of unpleasant garishness being imparted to it by the vitreous appearance of the glaze, which is manufactured according to European methods. The modern faience of Ito Tôzan of Kyôtô, decorated with colour under the glaze, is incomparably more artistic than the Tôkyô *Asahi-yaki*, from which, nevertheless, the Kyôtô master doubtless borrowed some ideas. The decorative industry in Tôkyô owed much also to the Kôshô-Kaisha, an institution started by Messrs Wakai and Matsuo in 1873, with official assistance. Owing to the intelligent patronage of this company, and the impetus given to the keramic trade by its enterprise, the style of the Tôkyô *etsuke* was much improved and the field of their industry extended. It must be acknowledged, however, that the Tôkyô artists often devote their skill to purposes of forgery, and that their imitations, especially of old *Satsuma-yaki*, are sometimes franked by dealers whose standing should forbid such frauds. In this context it may be mentioned that, of late years, decoration of a remarkably microscopic character has been successfully practised in Kyôtô, Osaka, and Kobe, its originator being Meisan of Osaka. Before dismissing the subject of modern Tôkyô keramics, it may be added that Kato Tomataro, mentioned above in connexion with the manufacture of special glazes, has also been very successful in producing porcelains decorated with blue *sous couverte* at his factory in the Koishikawa suburb.

Modern wares of Hirado.

Higuchi of Hirado is to be classed with keramists of the new school on account of one ware only, namely, porcelain having translucid decoration, the so-called "grains-of-rice" of American collectors, designated "fire-fly style" (*hotaru-de*) in Japan. That, however, is an achievement of no small consequence, especially since it had never previously been essayed outside China. The Hirado expert has not yet attained technical skill equal to that of the Chinese. He cannot, like them, cover the greater part of a specimen's surface with a lacework of transparent decoration, exciting wonder that *pâte* deprived so greatly of continuity could have been manipulated without accident. But his artistic instincts are higher than those of the Chinese, and there is reasonable hope that in time he may excel their best works. In other respects the Hirado factories do not produce wares nearly so beautiful as those manufactured there between 1759 and 1840, when the *Hirado-yaki* stood at the head of all Japanese porcelain on account of its pure, close-grained *pâte*, its lustrous milk-white glaze, and the soft clear blue of its carefully executed decoration.

Ware of Owari.

The Owari potters were slow to follow the lead of Miyagawa Shôzan and Seifû Yôhei. At the industrial exhibition in Kyôtô in 1895 the first results of their efforts were shown, attracting attention at once. Owari, though from the abundance of the output of its Seto kilns the Japanese generic term for keramic ware (*setomono*) is derived, never deserved to be reckoned among the centres of art production. In mediæval times it was celebrated for faience glazes of various colours, much affected by the tea-clubs, but its staple manufacture from the beginning of the 19th century was porcelain decorated with blue under the glaze, the best specimens of which did not approach their Chinese prototypes in fineness of *pâte*, purity of glaze, or richness of colour. During the first twenty-five years of the *Meiji* era the Owari potters sought to compensate the technical and artistic defects of their pieces by giving to them magnificent dimensions; but at the Tôkyô industrial exhibition of 1891 they were able to contribute some specimens showing decorative, plastic, and graving skill of no mean order. Previously to that time, one of the Seto experts, Kato Gosuke, had developed remarkable ability in the manufacture of *céladon*, though in that field he was subsequently distanced by Seifû of Kyôtô. Only lately did Owari feel the influence of the new movement towards Chinese types. Its potters took *flambé* glazes

for models, and their pieces of that nature possessed an air of novelty that attracted connoisseurs. But the style was not calculated to win general popularity, and the manufacturing processes were too easy to occupy the attention of great potters. On a far higher level stood egg-shell porcelain, remarkable examples of which were sent from Seto to the Kyôtô industrial exhibition of 1895. Chinese potters of the *Yung-lo* era (1403–14) enriched their country with a quantity of ware to which the name of *totai-ki* (bodiless utensil) was given on account of its wonderfully attenuated *pâte*. The finest specimens of this porcelain had incised decoration, sparingly employed but adding much to the beauty of the piece. In subsequent eras the potters of Ching-te-chen did not fail to continue this remarkable manufacture, but its only Japanese representative was a porcelain distinctly inferior in more than one respect, namely, the egg-shell utensils of Hizen and Hirado, some of which had finely woven basket-cases to protect their extreme fragility. The Seto experts, however, are now making bowls, cups, and vases that rank nearly as high as the celebrated *Yung-lo totai-ki*. In purity of tone and velvet-like gloss of surface there is distinct inferiority on the side of the Japanese ware, but in thinness of *pâte* it supports comparison, and in profusion and beauty of incised decoration it excels its Chinese original.

Latest of all to acknowledge the impulse of the new departure have been the potters of Kaga. For many years their ware enjoyed the credit, or discredit, of being the most lavishly decorated porcelain in Japan. It is known to Western collectors as a product blazing with red and gold, a very degenerate offspring of the Chinese *Ming* type, which Hozen of Kyôtô reproduced so beautifully at the beginning of the 19th century under the name of *Eiraku-yaki*. Undoubtedly the best specimens of this *kinran-de* (brocade) porcelain of Kaga merit praise and admiration; but, on the whole, ware so gaudy could not long hold a high place in public esteem. The Kaga potters ultimately appreciated that defect. They still manufacture quantities of tea and coffee sets, and dinner or dessert services of red-and-gold porcelain for foreign markets; but about 1885 some of them made zealous and patient efforts to revert to the processes that won so much fame for the *Kutani-yaki* of the old times, with its grand combinations of rich, lustrous, soft-toned glazes. The attempt was never entirely successful, but its results restored something of the Kaga kilns' reputation. Since 1895, again, a totally new departure was made by Morishita Hachizaemon, a keramic expert, in conjunction with Shida Yasukyo, president of the Kaga Products Joint Stock Company (*Kaga Bussan Kabushiki Kaisha*) and teacher in the Kaga Industrial School. The line chosen by these keramists is purely Chinese. Their great aim seems to be the production of the exquisite Chinese monochromes known as *u-kwo-tien-tsing* (blue of the sky after rain) and *yueh-peh* (*clair-de-lune*), into the composition of both of which glazes gold enters. But they also devote much attention to porcelains decorated with blue or red *sous couverte*. Their work shows much promise, but like all fine specimens of the Sinico-Japanese school, the prices are too high to attract wide custom.

Ware of Kaga.

The sum of the matter is that the modern Japanese keramist, after many efforts to cater for the taste of the Occident, evidently concludes that his best hope consists in devoting all his technical and artistic resources to reproducing the celebrated wares of China. In explanation of the fact that he did not essay this route in former times, it may be noted, first, that he had only a limited acquaintance with the wares in question; secondly, that Japanese connoisseurs never attached any value to their countrymen's imitation of Chinese porcelains so long as the originals were obtainable; thirdly, that the keramic art of China not having fallen into its present state of decadence, the idea of competing with it did not occur to outsiders; and fourthly, that Europe and America had not developed their present keen appreciation of Chinese masterpieces. Yet it is remarkable that China, at the close of the 19th century, should have again furnished models to Japanese eclecticism. There are reasons which render it doubtful whether the Japanese potter, without a radical change of technical methods, will ever reach the level upon which the Chinese masters stood, but it is very probable that he may produce *en route* many beautiful and excellent varieties of porcelain.

Summary.

Cloisonné Enamel.—Cloisonné enamel is a branch of applied art which may be considered essentially of modern development in Japan. The process was known at an early period, and was employed for purposes of subsidiary decoration from the close of the 16th century, but not until the 19th century did Japanese experts begin to manufacture the objects known in Europe as "enamels"; that is to say, vases, plaques, censers, bowls and so forth, having their surface covered with vitrified pastes applied either in the *champlevé* or the *cloisonné* style. It is necessary to insist upon this fact, because the only European author who has attempted to discuss the subject of Japanese enamels at any length fell into the serious error of supposing that numerous specimens which began to be exported from 1865 were the outcome of industry commencing in the 16th century and reaching its point of culmination at the beginning of the 18th. There is not the slenderest ground for such a theory. The work began in 1838, and Kaji Tsunekichi of Owari was its originator. Without pausing here to describe the circumstances that led to this innovation, it will be sufficient to say that, during twenty years previously to the reopening of the country in 1858, *cloisonné* enamelling was practised in the manner now understood by the term, and that when foreign merchants began to settle in Yokohama several experts were working skilfully in Owari after the methods of Kaji Tsunekichi. Up to that time there had been little demand for enamels of large dimensions, but when the foreign market called for vases, censers, plaques, and such things, no difficulty was found in supplying them. Thus, about the year 1865, there commenced an export of enamels which had no prototypes in Japan, being destined frankly for European and American collectors. From a technical point of view these specimens had much to recommend them. The base, usually of copper, was as thin as cardboard; the cloisons, exceedingly fine and delicate, were laid on with care and accuracy; the colours were even, and the designs showed artistic judgment. Two faults, however, marred the work—first, the shapes were clumsy and unpleasing, being copied from bronzes whose solidity justified forms unsuited to thin enamelled vessels; secondly, the colours, sombre and somewhat impure, lacked the glow and mellowness that give decorative superiority to the technically inferior Chinese enamels of the later *Ming* and early *Tsing* eras. Very soon, however, the artisans of Nagoya (Owari), Yokohama, and Tôkyô—where the art had been taken up—found that faithful and fine workmanship did not pay. The foreign merchant desired many and cheap specimens for export, rather than few and costly. There followed then a period of gradual decline, and the enamels exported to Europe showed so much inferiority that they were supposed to be the products of a widely different era and of different makers. The industry was threatened with extinction, and would certainly have dwindled to

History.

insignificant dimensions had not a few earnest artists, working in the face of many difficulties and discouragements, succeeded in striking out new lines and establishing new standards of excellence.

Three clearly differentiated schools now (1875) came into existence. One, headed by Namikawa Yasuyuki of Kyôtô, took for its objects the utmost delicacy and perfection of technique, richness of decoration, purity of design, and harmony of colour. The thin clumsily-shaped vases of the Kaji school, with their uniformly distributed decoration of diapers, scrolls, and arabesques in comparatively dull colours, ceased altogether to be produced, their place being taken by graceful specimens, technically flawless, and carrying designs not only free from stiffness, but also executed in colours at once rich and soft. This school may be subdivided, Kyôtô representing one branch, Nagoya, Tôkyô, and Yokohama the other. In the products of the Kyôtô branch the decoration generally covered the whole surface of the piece; in the products of the other branch the artist aimed rather at pictorial effect, placing the design in a monochromatic field of low tone. It is plain that such a method as the latter implies great command of coloured pastes, and, indeed, no feature of the manufacture is more conspicuous than the progress made during the period 1880–1900 in compounding and firing vitrifiable enamels. Many excellent examples of *cloisonné* enamel have been produced by each branch of this school. There is nothing like them to be found in any other country, and they stand at an immeasurable distance above the works of the early Owari school represented by Kaji Tsunekichi and his pupils and colleagues.

New schools.

The second of the modern schools is headed by Namikawa Sosuke of Tôkyô. It is an easily traced outgrowth of the second branch of the first school just described, for one can readily understand that from placing the decorative design in a monochromatic field of low tone, which is essentially a pictorial method, development would proceed in the direction of concealing the mechanics of the art in order to enhance the pictorial effect. Then arose the so-called "cloisonless enamels" (*musenjippô*). They are not always without cloisons. The design is generally framed at the outset with a ribbon of thin metal, precisely after the manner of ordinary *cloisonné* ware. But as the work proceeds the cloisons are hidden—unless their presence is necessary to give emphasis to the design—and the final result is a picture in vitrified enamels.

Cloisonless enamels.

The characteristic productions of the third among the modern schools are monochromatic and translucid enamels. All students of the keramic art know that the monochrome porcelains of China owe their beauty to the fact that the colour is in the glaze, not under it. The keramist finds no difficulty in applying a uniform coat of pigment to porcelain biscuit, and covering the whole with a diaphanous glaze. The colour is fixed and the glaze set by secondary firing at a lower temperature than that necessary for hardening the *pâte*. Such porcelains, however, lack the velvet-like softness and depth of tone so justly prized in the genuine monochrome, where the glaze itself contains the colouring matter, *pâte* and glaze being fired simultaneously at the same high temperature. It is apparent that a vitrified enamel may be made to perform, in part at any rate, the function of a porcelain glaze. Acting upon that theory, the experts of Tôkyô and Nagoya have produced many very beautiful specimens of monochrome enamels—yellow (canary or straw), *rose du Barry*, liquid-dawn red, aubergine purple, green (grass or leaf), dove-gray and lapis-lazuli blue. These pieces do not quite reach the level of Chinese monochrome porcelains, but their inferiority is not marked. The artist's great difficulty is to hide the metal base completely. A monochrome loses much of its attractiveness when the colour merges into a metal rim, or when the interior of a vase is covered with crude unpolished paste. But to spread and fix the enamel so that neither at the rim nor in the interior shall there be any break of continuity, or any indication that the base is copper, not porcelain, is a *tour de force* demanding quite exceptional skill.

Mono-chromatic enamels.

The translucid enamels of the modern school are generally associated with decorative bases. In other words, a suitable design is chiselled in the metal base so as to be visible through the diaphanous enamel. Very beautiful effects of broken and softened lights, combined with depth and delicacy of colour, are thus obtained. But the decorative designs which lend themselves to such a purpose are not numerous. A gold base deeply chiselled in wave diaper and overrun with a paste of aubergine purple is the most pleasing. A still higher achievement is to apply to the chiselled base designs executed in coloured enamels, finally covering the whole with translucid paste. Admirable results are thus produced; as when, through a medium of cerulean blue, bright goldfish and blue-backed carp appear swimming in silvery waves, or brilliantly-plumaged birds seem to soar among fleecy clouds. The artists of this school show also much skill in using enamels for purposes of subordinate decoration —for example, suspending enamelled butterflies, birds, floral sprays, &c., among the reticulations of a silver vase chiselled *à jour*; or filling with translucid enamels parts of a decorative scheme sculptured in iron, silver, gold, or *shakudo*.

Translucid enamel.

It will be seen at once that Japanese workers in *cloisonné* enamels have made immense strides since the days when they sent to Europe specimens such as those depicted in Mr Audsley's book on *The Ornamental Arts of Japan*. The art may indeed be said to have been developed during the last quarter of the 19th century from a condition of comparative crudeness to one of unparalleled excellence. There was no reason to anticipate that the Japanese would take the lead of the world in this branch of applied art. They had no presumptive title to do so. Yet they certainly have done so. (F. BY.)

Lacquer.—The early history of the art of lacquer work in Japan consists of references to it in the ancient chronicles, and to the creation of official posts for its regulation, which go back to a date as early as the 3rd century B.C. These statements may not be of absolute authenticity, but it is indisputable that the industry existed at that time or soon afterwards, and at an extraordinarily early period a very considerable amount of skill had been developed in working it. In the temple at Nara are still preserved specimens of lacquer work attributed to the 3rd century of our era, and a series of objects which certainly belonged to Shotoku Daishi (died A.D. 621), as well as other examples but little later in date. The art became popular, and was always in high favour among the aristocracy, so that from this time numerous records of its progress are found, as well as a continuous series of examples. Up to the end of the 12th century the art had been practised at Kyôtô; but the first Shoguns removed the capital at that time to Kamakura, which thus became its centre for the next 200 years, after which it again followed the seat of the main Government. Among the many skilled artists who have practised this beautiful craft since the first on record, Kiyohara Norisuye (*c.* 1169), may be mentioned Kôyetsu (1558–1637) and his pupils, who are especially noted for their *inro* (medicine-cases worn as part of the costume); Kajikawa Kinjirô (*c.* 1680), the founder of the

great Kajikawa family, which continued up to the 19th century; and Koma Kiuhaku (d. 1715), whose pupils and descendants maintained his traditions for a period of equal length. Of individual artists, perhaps the most notable is Ogata Kôrin, whose skill was equally great in the arts of painting and pottery. He was the eldest son of an artist named Ogato Sôken, and studied the styles of the Kanô and Tosa schools successively. Among the artists who influenced him were Kanô Tsunenobu, Nomura Sotatsu, and Kôyetsu. His lacquer ware is distinguished for a bold and at times almost eccentric impressionism, and his use of inlay is strongly characteristic. He died in 1716 at an age variously stated by Japanese authorities as fifty-five and fifty-nine. Ritsuô (1663–1747), a pupil and contemporary of Kôrin, and like him a potter and painter also, was another lacquerer of great skill. Then followed Hanzan, the two Shiome, Yamamoto Shunshô and his pupils, Yamada Jôka and Kwanshôsai Tôyô (late 18th century). In the beginning of the 19th century worked Shôkwasai, who frequently collaborated with the metal-worker Shibayama, encrusting his lacquer with small decorations in metal by the latter. The greatest lacquerer of the 19th century was, however, Shibata Zeshin (a pupil of Koma Kwansai), who died in 1891, and to whose efforts and influence the survival of the making of good art lacquer ware in Japan at the present time is undoubtedly due. His pupil, Ikeda Taishin, was alive in 1894, and his son, Reisai Shibata, has also produced excellent work on the lines of that of his father. It is of interest to note that the Official Report of the Third National Industrial Exhibition of Japan classified the lacquer workers of Tôkyô into five groups, headed by the following artists respectively:—1. Shibata Zeshin; 2. Ogawa Shômin; 3. Shirayama Shôya; 4. Kawanobe Itcho; 5. Uyematsu Hômin. With the growth of commerce with the West there was a great danger that this beautiful and laborious art would be vulgarized in order to meet the demand in Europe for cheap imitations of the old wares; but although the modern productions are perhaps hardly quite up to the level of those of bygone days, still they do retain very considerable artistic qualities, and the patronage extended to the lacquerers by the Court and aristocracy of Japan is still sufficient to preserve it as a living art. (See also LACQUER.)

Engraving.—Although a little engraving on copper has been practised in Japan of late years, it is of no artistic value, and the only branch of the art which calls for recognition is the cutting of wood-blocks for use either with colours or without. This, however, is of supreme importance, and as its technique differs in most respects from the European practice, it demands a somewhat detailed description. The wood used is generally that of the cherry-tree, *sakura*, which has a grain of peculiar evenness and hardness. It is worked plank-wise to a surface parallel with the grain, and not across it. A design is drawn by the artist, to whom the whole credit of the production generally belongs, with a brush on thin paper, which is then pasted face downwards on the block. The engraver, who is very rarely the designer, then cuts the outlines into the block with a knife, afterwards removing the superfluous wood with gouges and chisels. Great skill is shown in this operation, which produces perhaps the finest facsimile reproduction of drawings ever known without the aid of photographic processes. A peculiar but highly artistic device is that of gradually rounding off the surfaces where necessary, in order to obtain in printing a soft and graduated mass of colour which does not terminate too abruptly. In printing with colours a separate block is made in this manner for each tint, the first containing as a rule the mere lines of the composition, and the others providing for the masses of tint to be applied. In all printing the paper is laid on the upper surface of the block, and the impression rubbed off with a circular pad, composed of twisted cord within a covering of paper, cloth, and bamboo-leaf, and called the *baren.* In colour-printing the colours, which are much the same as those in use in Europe, are mixed, with rice-paste as a medium, on the block for each operation, and the power of regulating the result given by this custom to an intelligent craftsman (who, again, is neither the artist nor the engraver) was productive in the best period of very beautiful and artistic effects, such as could never have been obtained by any mechanical device. A register or correct superposition successively of each block of wonderful accuracy is got mainly by the skill of the printer, who is assisted only by a mark defining one corner, and another showing the opposite side limit. The origins of this method of colour-printing are obscure. It has been practised to some extent in China and Korea, but there is no evidence of its antiquity in these countries. It appears to be one of the few indigenous arts of Japan. But before accepting this conclusion as final, one must not lose sight of the fact that the so-called *chiaroscuro* engraving was at the height of its use in Italy at the same time that embassies from the Christians in Japan visited Rome, and that it is thus possible that the suggestion at least may have been derived from Europe. The fact that no traces of it have been discovered in Japan would be easily accounted for, when it is remembered that the examples taken home would almost certainly have been religious pictures, would have been preserved in well-known and accessible places, and would thus, likely enough, have been entirely destroyed in the terrible and minute extermination of Christianity by Hideyoshi at the beginning of the 17th century. The Japanese tradition ascribes the invention of colour-printing to Idzumiya Gonshirô, who about the end of the 17th century first made use of a second block to apply a tint of red (*beni*) to his prints. Sir Ernest Satow states more definitely that "Sakakibara attributes its origin to the year 1695, when portraits of the actor Ichikawa Dajiuro, coloured by this process, were sold in the streets of Yedo for five cash apiece." The credit of the invention is also given to Torii Kiyonobu, who worked at about this time, and, indeed, is said to have made the prints above mentioned. But authentic examples of his work now remaining, printed in three colours, seem to show a technique too complete for an origin quite so recent. However, he is the first artist of importance to have produced the broadsheets—chiefly for many years portraits of notable actors, historical characters, and famous courtesans—which are the leading and characteristic use to which the art was applied. Pupils, the chief of whom were Kiyomasa, Kiyotsume, Kiyomitsu, Kiyonaga, and Kiyomine, carried on his tradition until the end of the 18th century, the earlier using but few colours, while the works of the two last named show a technical mastery of all the capabilities of the process. The next artist of importance is Sazuki Harunobu (worked *c.* 1760–80), to whom the Japanese sometimes ascribe the invention of the process, probably on the grounds of an improvement in his technique, and the fact that he seems to have been one of the first of the colour-print makers to attain great popularity. Katsukawa

Shunshō (d. 1792) must next be mentioned, not only for the beauty of his own work, but because he was the first master of Hokusai; then Yeishi (worked c. 1781–1800), the founder of the Hosoda school; Utamaro (1754–1806), whose prints of beautiful women were collected by Dutchmen while he was still alive, and have had in our own day a vogue greater, perhaps, than those of any other of his fellows; and Toyokuni I. (1768–1825), who especially devoted himself to broadsheet portraits of actors and dramatic scenes. The greatest of all the artists of the popular school was, however, Hokusai (1760–1849). His most famous series of broadsheets is the "Thirty-Six Views of Mount Fuji" (1823–29), which, in spite of the conventional title, includes at least forty-six. His work is catalogued in detail by E. de Goncourt. At the beginning of the 19th century the process was technically at its greatest height, and in the hands of the great landscape artist, Hiroshige I., as well as the pupils of Toyokuni I.—Kunisada and Kuniyoshi—and those of Hokusai, it at first kept up an excellent level. But an undue increase in the number of blocks used, combined with the badness of the imported colours and carelessness or loss of skill in printing, brought about a rapid decline soon after 1840. This continued until the old traditions were well-nigh exhausted, but since 1880 there has been a distinct revival. The prints of the present day are cut with great skill, and the designs are excellent, though both these branches seem to lack the vigour of conception and breadth of execution of the older masters. The colours now used are almost invariably of cheap German origin, and though they have a certain prettiness—ephemeral, it is to be feared—they again cannot compare with the old native productions. Among workers in this style, Yoshitoshi (died c. 1898) was perhaps the best. Living artists in 1902 included Toshihide, Miyagawa Shuntei, Yoshiu Chikanobu—one of the elder generation—Tomisuka Yeishu, Toshikata, and Gekko. Formerly the colour-print artist was of mean extraction and low social position, but, thanks perhaps to European influence, he now has some recognition at the hands of the professors of more esteemed branches of art. (E. F. S.)

Illustrated Books.—The history of the illustrated book in Japan may be said to begin with the *Ise Monogatari*, a romance first published in the 10th century, of which an edition adorned with woodcuts appeared in 1608. In the course of the 17th century many other works of the same nature were issued, including some in which the cuts were roughly coloured by hand; but the execution of these is of no great merit, and certainly not as good as contemporary European work. The date of the first use of colour-printing in Japanese book illustration is uncertain. In 1667 a collection of designs for *kimono* appeared, in which inks of several colours are made use of; but these are only employed in turn for single printings, and in no case are two of them used on the same print. It is certain, however, that the mere use of coloured inks must soon have suggested the combination of two or more of them, and it is probable that examples of this will be discovered much earlier in date than known at present. About the year 1680 lived and worked Hishikawa Moronobu, whose vigour and artistic excellence achieved a great popularity for woodcut illustration, and laid the foundations of the splendid school which followed. The names of the engravers who cut his designs are not known, and in fact the reputation of these craftsmen is curiously subordinated to that of the designers in all Japanese work of the kind. Moronobu died between 1711 and 1715, at the age of about 70. With him must be associated Okumura Masanobu, who was a little later perhaps in date, but whose work is also of considerable value. During the ensuing thirty years numerous illustrated books appear, including the earliest yet known which are illustrated by colour-printing. The next artist of importance is Nishikawa Sukenobu (1671–1751), who illustrated a very large number of books, many of which were only published after his death. With him may be associated Ichiô Shumboku (died c. 1773) and Tsukioka Tange (1717–1786), the latter of whom made the drawings for many of the *meishô* or guide-books which form so interesting and distinctive a branch of Japanese illustration. The work of Tachibana Morikuni (1670–1748) is also of great importance. The books illustrated by the men of this school were mainly collections of useful information, guide-books, romances, and historical and religious compilations; but much of the best of their work is to be found in the collections of pictorial designs, very often taken from Chinese sources, which were produced for the use of workers in lacquer, pottery, and similar crafts. These, both for design and for skill of cutting, hold their own with the best work of European woodcutting of any period. The development of the art of Japanese colour-printing naturally had its effect on book-illustration, and the latter years of the 18th and the earlier of the 19th century saw a vast increase of books illustrated by this process. The subjects also now include a new series of landscapes and views drawn as seen by the designers, and not reproductions of the work of other men; and also sketches of scenes and characters of every-day life, and of the folk-lore in which Japan is so rich. Of the artists of this period, as of all others in Japan, Hokusai (1760–1849) is absolutely pre-eminent. His greatest production in book-illustration was the *Mangwa*, a collection of sketches which cover the whole ground of Japanese life and legend, art and handicraft. It consists of fifteen volumes, which appeared at intervals from 1812 to 1875, twelve being published during his life and the others from material left by him. Among his many other works may be mentioned shortly the *Azuma Asobi*, "Walks round Yedo" (1799), *The Hundred Views of Mount Fuji* (1834), and his many illustrations to novels. Of his pupils, Hokkei (1780–1856) and Kiôsai were the greatest. Most of the artists, whose main work was the designing of broadsheets, produced elaborately illustrated books; and this series includes specimens of printing in colours from wood-blocks, which for technique have never been excelled. Among them, as typical instances, should be mentioned Shunshô (*Seirô Bijin Awase kagami*, 1776); Utamaro (*Seirô Nenjiu gioji*, 1804); Toyokuni I. (*Yakusha Kono Teikishiwa*, 1801); as well as Harunobu Yeishi (*Onna sanjiu rokkasen*, 1798); Kitao Masanobu, and Tachibana Minko, each of whom produced beautiful work of the same nature.

In the period next following the chief artists were Keisai Yeisen (*Keisai so-gwa*, 1832), and Kikuchi Yosai (*Zenken Kojitsu*), the latter of whom ranks perhaps as highly as any of the artists who confined their work to black and white. The books produced in the period 1880–1900 in Japan are still of high technical excellence. The colours are, unfortunately, of cheap European manufacture; and the design, although quite characteristic and often beautiful, is as a rule merely pretty. The engraving is as good as ever. Among the book-illustrators of our own generation must be again mentioned Kiôsai; Kôno Bairei (d. 1895), whose books of birds—the *Bairei Hyakuchô Gwafu* (1881 and 1884) and *Iuaka-no-Tsuki* (1889)—are unequalled of their kind; Imao Keinen, who also issued a beautiful set of illustrations of birds and flowers, *Keinen Kwachô Gwafu*, engraved by Tanaka Jirokichi, and printed by Miki Nisaburô (1891–92);

and Watanabe Seitei, whose studies of similar subjects have appeared in *Seitei Kwachô Gwafu* (1890–91) and the *Bijutsu Sekai* (1894), engraved by Gotô Tokujirô. Mention should also be made of several charming series of fairy tales, of which that published in English by the *Kobunsha* at Tôkyô in 1885, &c., is perhaps the best. In their adaptation of modern processes of illustration the Japanese are entirely abreast of the Western nations, the chromo-lithographs and other reproductions in the *Kokkwa*, a periodical record of Japanese works of art (begun in 1889), and in the publications of Ogawa being of quite a high order of merit.

V. RECENT LITERATURE (1867–1900).

The downfall of the Shogunate was a fatal blow to the Chinese influences which for two and a half centuries had moulded every department of the Japanese national life—the political institutions, laws, science, philosophy, and literature. Signs of change were observable at an earlier period. In the latter part of the 18th century China had already lost some of its prestige, and the Dutch language with the European art of medicine had begun to be studied. But no substantial progress in the substitution of Europe for China as a source of knowledge and inspiration was made until the revolution which in 1867 restored the Mikado to his rightful position as sovereign. Under the new political conditions there were at first more urgent matters to be attended to than the cultivation of literature. The constitution had to be rebuilt, the laws remodelled, an army and navy organized, and a national system of education established. For these purposes, however, the study of European models was indispensable, and was taken up with extraordinary zeal and energy by all the younger and more active minds. A group of writers now came forward who made it their business to meet the demand of their countrymen for information as to the manners and customs, the learning, science, and institutions of Europe. Of these the most eminent was Fukuzawa, whose *Seiyō Jijō* ("*Things European*") was published in 1866, while a more recent work, an autobiography, bears date 1899. The latter is a noteworthy document bearing on the spread of European ideas in Japan. Translations of English books appeared in increasing numbers, and about 1872 a fresh impulse was given to the dissemination of European knowledge by the rise of a magazine and newspaper press.

The influence of Europe on Japanese literature proper dates from 1879, when a translation appeared of Lord Lytton's *Ernest Maltravers.* It attracted great attention, and was followed by other works of fiction, mostly English. More recently, French, German, and even Russian novelists have been laid under contribution. The result has been a thorough revolution in the Japanese art of novel-writing. The artificial word-plays, conventional character-drawing, fantastic morality, and extravagances of every kind of the older romantic school, have now been in great measure abandoned in favour of a more sober, common-sense style of writing. Tsuboüchi Yuzô was the leader of this movement. His *Shôzetsu Shinsui* ("*Spirit of Fiction*") is an unsparing attack on the methods and principles of Bakin and his school. He illustrated his views by novels and dramas, which have not only much intrinsic merit, but are valuable as pointing the way to a return to living realities. Bimyôsai writes in the colloquial dialect, which in Japan differs considerably in grammar and vocabulary from the literary language. His *Natsu Kadachi* is a series of short stories which bear manifest traces of the influence of European models. Kôyô in his realistic novels is also a writer in the colloquial dialect, the use of which for literary purposes has made great progress in recent years. Rohan is perhaps the most popular, as he is the most voluminous, writer of the present day. His historical novels are distinguished by dignity of language and by a tone of moral sentiment which belongs more to the past than to the present. Ichiyô, who died in 1896 at the age of twenty-four, was the author of a series of novelettes of great promise. She took the human and especially the female heart for her province. There is no little pathos in some of her stories, but it is to be regretted that the pleasure of their perusal is often marred, at least for European readers, by a subtlety or haziness of expression which borders on the unintelligible. Murai's *Hinodeshima* (1898–1900) is an entertaining study of New Japan, in which those who are interested in the curious moral and social results of the conflict between old and new, between China and Europe, will find much food for reflexion. Fiction occupies as prominent a position in recent Japanese literature as it does in Great Britain or the United States, and the above-mentioned writers are only a few out of many. Both for quality and quantity it is the most important that Japan has yet seen.

Although European principles of historical criticism are to some extent known and appreciated in Japan, little practical progress has been made in writing historical works. There is no scarcity of books of this kind, but they are generally either epitomes of Chinese, Japanese, or European histories, or else mere collections of materials. Tokutomi Iichirô's *Shôrai no Nihon* ("*Japan of the Future*") is an attempt to forecast the future of Japan by a philosophical examination of its past history. It has received high praise, not only for its matter, but for its style. Other important works are Marquis Ito's *Commentary on the Constitution*, Nose Yei's *Treatise on Education*, and a *History of Japanese Literature* by Mikami and Takatsu.

Until recently the poetry of Japan consisted mainly of short effusions in pure Japanese of seventeen or thirty-one syllables, forms of verse which afford no scope for the exercise of the poet's higher faculties. The publication in 1882 of a little work entitled *Shintaishishô* ("*Poetry of New Form*") by three authors, one of whom was Toyama, a professor of the Imperial University, marks the beginning of a new era in the history of Japanese poetry. It consists of nineteen poems of no great length, only a few of which are original compositions, the remainder being with one exception verse translations from English poets. The writers follow the traditional rule of the alternation of phrases of five and seven syllables, which in Japan constitutes metre, but the influence of their foreign models is traceable in the division of their poems into stanzas of equal length, an improvement which has been largely followed. Their most striking innovation, however, is the free introduction of Chinese words, which, on account of their flagrantly exotic appearance, had hitherto been rigorously excluded from all but the most vulgar forms of verse. A rule which debarred the use of such common words as *budô* (vine), Tôkyô (the name of the capital), *honshin* (conscience), was bound sooner or later to be relaxed, but Toyama probably went too far in this direction. The most successful poets of the new school are far more sparing in their use of Chinese vocables. In

their choice of themes and mode of treatment, Toyama and his collaborators are avowedly influenced by their English models. A lively controversy between old and new was aroused by this publication. The new school is at present unquestionably in the ascendant, and though the old thirty-one syllable poems are still written, they must be regarded rather as literary exercises than as literature. The real poetry of Japan is exemplified by such works as *Hana Momiji* by Shiwoi Ukô and two others, *Natsumushi Suzumushi* by Usuda, and *Wakana-Shiu* by Shiwozaki, collections of vague and dreamy, but pleasing and melodious lyrics, which give promise of better days for the art of poetry in Japan.

(W. G. AS.)

Jarkent, or DJARKENT, a district town of Russian Central Asia, province Semiryechensk, 153 miles east of Vyernyi, near to Ili river. It has a customs house for trade with China. Population (1897), 16,372.

Jaromierz (Czech, *Jaroměř*), a town in the government district of Königinhof in Bohemia. It has two suspension bridges across the Elbe, and is a station on the Austrian North-Western Railway. It has manufactures of chicory, sugar, jute, and textiles, and has a number of steam mills and brickfields. Population (1890), 6543, mostly Czech and Roman Catholic; (1900), 6671.

Jaroslau, the chief town of a government district in Galicia, Austria, on the left bank of the San, a tributary of the Vistula, and a station on the Austrian State railway between Cracow and Lemberg. It is the military headquarters of the district and has a garrison of 4964 men. The manufactures comprise linen, spodium or tutty, bricks and tiles, pottery, spirits, &c., and there is a considerable trade in hides, corn, and timber. Population (1890), 18,065; (1900), 22,614.

Jarrow-on-Tyne, a municipal borough (1875, extended 1884) in the Jarrow parliamentary division of County Durham, England, 6 miles east of Gateshead by rail. St Peter's Church was erected in 1881, and a chapel of ease in 1885, besides a mission church and Roman Catholic, Congregational, Baptist, Presbyterian, Wesleyan, and other places of worship. The area of the borough is 1064 acres. Population (1881), 25,483; (1901), 34,294.

Jassy, in Rumanian *Iaşi*, a town of Rumania, chief town of the district of Jassy and the former capital of Moldavia, is situated 5 miles west of the Pruth, at the junction of railways from Galatz, Czernowitz, and Odessa. The town stands pleasantly amid vineyards and gardens, partly on the slopes of two hills, partly in the hollow between them, and is the see of an archbishop of the Orthodox Greek Church and of a bishop of the Roman Catholic Church; the seat of a university with about 420 students, a military school, music school, art school, and commercial school; and has an active trade in cereals, petroleum, salt, textiles, clothing, and metals. Population (1900), 78,067. Population of the district of Jassy (1900), 191,828; area, 1201 square miles.

Jath, a native state of India, in the Deccan division of Bombay, ranking as one of the Southern Mahratta Zagirs. Area (together with Daphlapur), 979 square miles. The population in 1881 was 49,486; in 1891, 71,443; average density (with Daphlapur), 81 persons per square mile; estimated gross revenue, Rs.4,05,195, of which Rs.10,243 was devoted to public works in 1897–1898; tribute, Rs.6400; number of police, 72; number of schools, 27, with 870 pupils. The chief, whose title is Deshmukh, is a Mahratta of the Daphle family. The town of JATH is 92 miles south-east of Satara. Population (1891), 5264.

Jativa, a town of Spain, in the province of Valencia, on the railway from Madrid to Valencia. The population is decreasing, and in 1897 was only 11,830. It is a centre for trade in the agricultural products of the fertile surrounding districts—wheat, fruit of all kinds, raisins, wine, oil, and rice. Several public buildings have been erected, including an institute, a foundling hospital, a bull-ring, two theatres, fine markets and public lavatories.

Jauer, a town of Prussia, province of Silesia, 13 miles by rail south of Liegnitz, on the Roaring (*Wüthende*) Neisse. It has a new town hall (1898), and is famous for its cooked sausages. The chief industries include sugar, carpets, leather, cloth, and carriages. Population (1885), 11,178; (1895), 11,978; (1900), 13,027.

Jaunpur, a city and district of British India, in the Benares division of the North-West Provinces. The city is on the left bank of the river Gumti, 34 miles north-west from Benares by rail. Population (1881), 44,845; (1891), 42,819; (1901), 42,532; municipal income (1897–1898), Rs.35,178; incidence of taxation, Rs.0:9:3 per head; registered death-rate (1897), 46·29 per thousand. The city has lost its importance, the only industry surviving being the manufacture of perfumes. The district of JAUNPUR has an area of 1550 square miles. The population in 1881 was 1,209,663; in 1891, 1,264,949, showing an increase of nearly 5 per cent.; average density, 810 persons per square mile, being the highest in the province. In 1901 the population was 1,202,710, showing a decrease of 5 per cent. The land revenue and rates were Rs.12,56,047, the incidence of assessment being just under R.1 per acre; cultivated area (1896–97), 600,666 acres, of which 351,540 were irrigated entirely from private wells; number of police, 2612; number of vernacular schools (1896–97), 112, with 4671 pupils; registered death-rate (1897), 36·40 per thousand. There are five printing-presses, all owned by Mahommedans, issuing one vernacular newspaper; 161 indigo factories, employing 5474 persons, with an out-turn valued at Rs.2,11,000. The district is crossed by the line of the Oudh and Rohilkhand railway from Benares to Fyzabad.

Jauréguiberry, Jean Bernard (1815–1887), French admiral, was born at Bayonne, 26th August 1815. He entered the navy in 1831, was made a lieutenant in 1845, commander in 1856, and captain in 1860. After serving in the Crimea and in China, and being governor of Senegal, he was promoted to rear-admiral in 1869. During the Franco-German war he had a command under Chanzy, and was repeatedly mentioned in despatches for his brilliant conduct and remarkable tenacity. He was promoted to be vice-admiral on 9th December 1870; and in the following January he played a brilliant part at the battle of Le Mans. In 1871 he commanded the fleet at Toulon; in 1875 he was a member of the council of admiralty; and in October 1876 he was appointed to command the evolutionary squadron in the Mediterranean. In February 1879 he became minister of the navy in the Waddington cabinet, and on the 27th May following was elected a senator for life. He was again minister of the navy in the Freycinet cabinet in 1880. He was made commander of the Legion of Honour in 1861, grand officer on 17th November 1870, and grand cross on 14th January 1879. A fine example of the fighting French seaman of his time, Jauréguiberry died at Paris on the 21st of October 1887.

Java, an island of the Malay (or Eastern) Archipelago, chief of the Dutch foreign possessions. It has a total area, with Madura, of 50,390 square miles.

Physical Features.—Three points in the geology of Java are important. (1) Like Sumatra and Borneo, Java was for several geological periods united with south-eastern Asia; hence the shallowness of the sea to the north, contrasting with the greater depth on the south in the direction of the Indian Ocean. (2) During the Triassic and Jurassic, though not during the Cretaceous era, Java, like Sumatra, was raised above sea-level, and in the Eocene and Oligocene periods subsided to below it. The strata of the late Tertiary era, broken and folded, constitute with their eruptive rocks the prevalent formation of Java. They compose the steep coasts and mountains up to 2950 feet high, and, at a lower level, the deep bays and gulfs of the straits of Sunda and Bali on the extreme east and west and of parts of the south coast, such as the gulfs of Prigi and Patjitan. (3) Later formations, viz., diluvial tuffs and alluvium of rivers and seas, gradually silting up bays and lakes and extending the coasts, served ultimately to piece together into one island the separate islands (at least eight) of which in that age Java consisted. Volcanoes especially have played a great part in giving to Java its present shape and character of surface. How far the younger formations prevail over the older rocks will be evident from the following arithmetical determinations:—All rocks dating from before the late Tertiary formation occupy only 1·16 per cent. of the surface. Rocks of the late Tertiary formation occupy 37·7 per cent. These stretch in a west-to-east direction over nearly all the residencies, with a thickness of from 10,000 to 19,600 feet and more. Recent volcanic rocks (leucite and phonolith) and volcanoes occupy 27·6 per cent. These lie in the direction of the longitudinal axis or run in cross lines. Only fourteen of the volcanoes have remained active within historic times. The Quaternary and recent formations occupy 33·5 per cent. These are found as alluvial deposits along the north and south coasts near the rivers, and as diluvial tuffs at the base or in the neighbourhood of the volcanoes, filling up lakes or basins in the Tertiary formation and occupying plains.

The relief of the surface of Java is in close keeping with its geological formations. Leaving out of account the oldest rocks, it is to be observed in respect of the Tertiary sediments and their eruptive rocks that, like the Deccan traps in British India, they have formed, as in South Preanger, plateaux of gentle declivity, or, as in Gunong Gaja in Tegal and Gunong Lingga in Kediri, steep and, owing to erosion, fantastically-shaped mountains, with a maximum height of 6200 feet: the former rise in chalk ranges to 2950 feet, in other sedimentary rocks to from 4200 to 4400 feet. The recent volcanoes vary much in height. There are fourteen more than 10,000 feet, Smeru being 12,060 feet; Slamat, 11,391 feet; Arjuno, 10,925 feet; Sumbing, 10,915 feet; Ravun, 10,902 feet; Lavu, 10,712 feet. In respect of the recent formations, it is to be observed that the alluvium of sea and rivers deposits itself in more level layers, or rises in table-lands of not more than 300 to 400 feet. More elevated, however, are the volcanic sediments of lakes formed in Tertiary basins, and drained by rivers eroding the banks. These old lake bottoms now form high plateaux, which are very fertile and often healthy. Such is the plateau of Bandong (2230 feet), the plain of Garut (1640 to 2290 feet), of Sumedang (1500 feet), of Ambarava (1500 feet), &c.

Western, middle, and eastern Java are distinguished from one another by the character of their mountains and plains. Bounded on the east by Tji Losari and Tji Tanduwi, western Java is a mountain mass of volcanic summits and plateaux, relieved by valleys, and is resolvable into five distinct regions: (1) The isolated mountains of north and west Bantam: Gunong Ayung and Batur in Anjer, and the extinct volcanoes Pulosari and Karang. (2) The mountains of south Bantam, covered with forests and thinly populated. (3) The Blue Mountains on the frontier of Batavia and Preanger, with the volcanic systems of Slamat and Gede. (4) The mountains of Preanger, consisting of four plateaux, those of Bandong, Pengalengan, Tegal Badung, and Garut, encircled by volcanoes. (5) The mountains of north-east Preanger and Cheribon, bounded on the east by the plain of Sumedang and the Tjerimaï. The low-lying plains of any great extent in western Java are all in the northern half, though some plains of narrow compass skirt parts of the west and south coast. Middle Java, stretching from Tjerimaï and Losari on the west to Merbabu and Merapi on the east, presents narrower chains, each flanked by low lands, smaller and more isolated volcanoes, and, accordingly, larger rivers flowing to the south coast. The high land of the western part as far east as the Slamat, 1000 to 1300 feet in height, stretches in a N.N.W.–S.S.E. direction. The high land of the central part pursues a course S.S.E.–N.N.W., reaching in the Jembangan a height of 8200 feet. The eastern part is occupied with the plateau of Dieng, the soil of which consists of the lava of a crater, with lakes and ruins round its edge. Its highest point is Prahu. The valley of the Progo, stretching away southwards, between the volcanoes of Sumbing and Sindoro on its west and of Merbabu and Merapi on its east, is included within the limits of middle Java. Eastern Java differs in its orographic character from both western and middle Java. Barren mountain chains of limestone and sandstone skirt the north and the south coast, running in a double range along the former. The plains lie between the coast chains and the intermediate volcanoes. Flowing between the coast chains in a west-to-east or east-to-west direction, or winding in a south-to-north direction between the volcanoes, the rivers drain much larger basins.

The plains differ in surface and fertility, according to their geological formation. Built up of alluvium and diluvium, the plains of the north coast lands in western and middle Java are at their lower levels, near the mouths of rivers and the sea, in many cases marshy and abounding in lakes and coral remains, but for the rest they are fertile and available for culture. The plains, too, along the south coast of middle Java—of Banyumas and Bagelen—contain many morasses as well as sandy stretches and dunes impeding the outlet of the rivers. They are, nevertheless, available for the cultivation more particularly of rice, and are thickly peopled. In eastern Java, again, the narrow coast plains are to be distinguished from the wider plains lying between the parallel chains of limestone and between the volcanoes. The narrow plains of the north coast are constituted of yellow clay and tuffs containing chalk, washed down by the rivers from the mountain chains and volcanoes. Like the western plains, they, too, are in many cases low and marshy, and fringed with sand and dunes. The plains, on the other hand, at some distance from the sea, or lying in the interior of eastern Java, such as Surakarta, Madiun, Kediri, Pasuruan, Probolinggo, and Besuki, owe their formation to the volcanoes at whose bases they lie, occupying levels as high as 1640 feet down to 328 feet above the sea, whence they decline to the lower plains of the coast. Lastly, the plains of Lusi, Solo, and Brantas, lying between the parallel chains in Japara, Rembang, and Surabaya, are in part the product of rivers formerly flowing at a higher level of from 30 to 60 or 70 feet, in part the product of the sea, dating from a time when the northern part of the above-named residencies was still an island, such as Madura

is still, the mountains of which are the continuation of the north parallel chain.

The considerable rivers of western Java all have their outlets on the north coast, the chief among them being the Tji Tarum and the Tji Manuk. They are navigable for native boats and rafts, and are used for the transport of coffee and salt. On the south coast the Tji Tanduwi, on the east of the Preanger, is the only stream available as a waterway, and this only for a few miles above its mouth. In middle Java, also, the rivers discharging at the north coast—the Pamali, Tjomal, &c.—are serviceable for the purposes of irrigation and cultivation, but are navigable only near their mouths. The rivers of the south coast—Progo, Serayu, Bogowonto, and Upak, enriched by rills from the volcanoes—serve abundantly to irrigate the plains of Bagelen, Banyumas, &c. Their stony beds, shallows, and rapids, and the condition of their mouths lessen, however, their value as waterways. More navigable are the larger rivers of eastern Java. The Solo is navigable for large praus or native boats as far up as Surakarta, and above that town for lighter boats, as is also its affluent the Gentung. The canal constructed in 1893 at the lower part of this river, and alterations effected at its mouth, have proved of important service both in irrigating the plain and facilitating the river's outlet into the sea. The Brantas is also navigable in several parts. The smaller rivers of eastern Java are, however, much in the condition of those of western Java. They serve less as waterways than as reservoirs for the irrigation of the fertile plains through which they flow.

The north coast of Java presents everywhere a low strand covered with nipa or mangrove, morasses and fishponds, sandy stretches and low dunes, shifting river-mouths and coast lines, ports and roads, demanding continual attention and regulation. The south coast is of a different make. The dunes of Banyumas, Bagelen, and Jokjokarta, ranged in three ridges, rising to 50 feet high, and varying in breadth from 300 to over 1600 feet, liable, moreover, to transformation from tides and the east monsoon, oppose everywhere, also in Preanger and Besuki, a barrier to the discharge of the rivers and the drainage of the coast lands. They assist the formation of lagoons and morasses. At intervals in the dune coast, running in the direction of the limestone mountains, there tower up steep inaccessible masses of land, showing neither ports nor bays, hollowed out by the sea, rising in perpendicular walls to a height of 160 feet above sea-level. Sometimes two branches project at right angles from the chain on to the coast, forming a low bay between the capes or ends of the projecting branches, from 1000 to 1600 feet high. Such a formation occurs frequently along the coast of Besuki, presenting a very irregular coast line. Of course the north coast is of much greater commercial importance than the south coast.

Climate.—The meteorological observations accumulated at Batavia, the extension of stations for measurement of rainfall all over the archipelago, and the instructive publications of the director of the Batavia Observatory, have contributed materially to the scope and definiteness of our knowledge of the climate. The monthly temperature, reaching the high mean throughout the year of 78·69° F., shows variations among the different months of not more than 1·8° F. The warmest months are May and October, registering 79·50° and 79·46° F. respectively. The coldest months are January and February, registering 77·63° and 77·70° F. respectively. The daily variations are much greater than the monthly, amounting to from 9° to 10·8° F. The causes of such a steady high temperature are to be attributed, not solely to the perpendicular direction of the sun's rays on the island, but also, as Mr Wallace rightly observes, to the warmth of the soil, the dampness of the atmosphere, and the high temperature of the sea (82·4° to 84·2° F.) over which the winds sweep. Anemometrical observations of higher precision and of wider compass show a strongly prevalent N.W. wind blowing from November to March, and a prevalent S.E. wind throughout the other half of the year. In some parts, however, of the archipelago, N.E. and S.W. winds occasionally take the place of the prevailing winds, a phenomenon to be explained by the fact of the transition of the one monsoon into the other ("*Kentering*," as it is called), by the mutual influence of land and sea breezes, or perhaps by the neighbourhood of the large island of Borneo. The amount of rainfall and the number of rainy days under the N.W. and under the S.E. monsoon are represented by very different figures. Out of 72·283 inches of annual rainfall at Batavia, 51·496 inches is the contribution of the N.W., and only 20·787 inches of the S.E. monsoon. The heavier burden of moisture brought by the N.W. monsoon and the lesser borne by the S.E. is to be explained not only by the interception of neighbouring Australia and its limitation of the sea on the S.E., but also by the fact that the ocean over which the S.E. monsoon blows is cooler than the Sea of Java, which is licked by the N.W. monsoon. The climate of western and middle Java differs in many respects from that of eastern Java. In western and middle Java the amount of rainfall and the number of rainy days increase with the increase of height, and the rain is much more regularly distributed over the year. Buitenzorg, *e.g.*, receives from November to April 97·5 inches of rain; in the other months 75·15 inches. Sinagar, south-east of Salak and Gede, again, has a rainfall from November to April of 75·075 inches; in the other months of 49·335 inches. In eastern Java the coast lands receive a smaller share of the annual rainfall—less than 58 inches. But contrasting the interior of the island in western and middle Java on the one hand with the interior of eastern Java on the other, whereas the former gets yearly from 108·6 to 156 inches or more of rain, the latter's share is only 72·6 to 117·6 inches. In eastern Java the four dry months from July to October show a great difference in their respective rainfalls, the monthly rainfall for each showing respectively a declining series of 1·1, 0·51, 0·236, and 0·157 inches, while the number of wet days in these months dwindles down to as low as 2 and 1 at Pasuruan and Besuki. On the south coast Tjilatjap is remarkable for the annual amount of its rainfall, 151·43 inches, the greater portion of which, 87·8 inches, is brought by the S.E. monsoon. The climate differs, of course, with difference of altitude.

Area and Population.—The following table gives the areas of the different residencies, together with the numbers of the various races inhabiting the island, and the total population in 1897:—

Residencies.	Area in Square Miles.	Europeans.	Chinese.	Arabs.	Other Foreign Inhabitants.	Natives.	Total Population 1897.
Bantam	3,030	302	1,959	54	35	706,989	709,339
Batavia	2,631	12,434	82,510	3,279	147	1,215,013	1,313,383
Krawang	1,785	201	4,717	90	..	441,957	446,965
Preanger	7,885	2,475	5,274	110	14	2,166,271	2,174,144
Cheribon	2,608	867	21,108	1,896	120	1,553,530	1,577,521
Tegal	1,466	953	8,650	717	7	1,191,292	1,201,619
Pekalongan	691	607	5,917	944	51	566,626	574,145
Banyumas	2,147	915	5,454	11	101	1,264,096	1,270,577
Bagelen	1,324	1,029	3,937	..	52	1,459,385	1,464,403
Jokjokarta	1,192	2,409	3,836	86	142	851,919	858,392
Surakarta	2,404	2,853	8,524	85	246	1,214,860	1,226,368

The total population in 1880 was 19,794,505, and in 1890, 23,912,564. The population of 1898 shows a considerable decline from the figures of 1897, being only 25,697,701, in which the native element numbers 25,370,545. The number of British residents at Batavia at the end of 1899 was 128; at Surabaya, 84; and at Samarang, 17. The population of Batavia (31st December 1896) was 115,567, 9423 of them Europeans; Buitenzorg, 25,000, 1500 of them Europeans; Surabaya, 142,980, 6988 of them Europeans; Samarang, 84,266, 3355 of them Europeans. The population of Batavia in 1897 was 115,567; Samarang, 84,244; Surabaya, 142,980; Surakarta, 86,074, of whom 1370 were Europeans; and Jokjokarta, 60,523, of whom 2240 were Europeans. One million out of the twenty-six millions are concentrated in towns, a fact readily explained by their sources of livelihood.

Occupations.—Of the European inhabitants, one-half are employed in the civil and military service, one-third are engaged in agriculture, and one-sixth follow trades. The Chinese inhabitants are mostly traders and labourers. The Arabs are nearly all traders

or employed on ships. At least three-quarters of the natives live by agriculture, and therefore the differences in density and concentration of population are chiefly to be explained by the different character of the land and the special physical features; in part, however, they are due to the character and habits of the Javanese, to the care exercised by the Government for the improvement of agriculture, ways of communication, and means of irrigation, to say nothing of its efforts for alleviating the pressure of inundation, blight of crops, and the low prices of products.

Religion and Instruction.—The number of Christians in Java increased from about 6000 in 1875 to 19,193 on the 1st January 1896. In 1900 there were 141 Christian missionaries in the Dutch East Indies. Primary schools for the natives increased from 306 with 37,099 pupils in 1883 to 468 with 67,480 pupils in 1899. The number of teachers in Government schools was, in 1888, 1405; in 1899, 1824. For the education of Europeans and persons assimilated with them, there were in the Dutch East Indies, in 1899, 7 public middle-class schools, with 1051 pupils and 118 teachers, costing the Government £49,278, the revenue from school fees being £7268. For Europeans there were, besides, in 1899, 135 mixed public elementary schools, 30 girls' schools, and 21 private schools. The 165 public schools had 546 teachers with 15,132 pupils, 1626 of them natives. The 21 private schools had 166 teachers with 3270 pupils. The cost of public elementary schools was, in 1899, £212,211, and the income £23,674. The Government expenditure on public instruction for the natives of Java in 1899 amounted to £125,108.

Minerals.—The geological explorations of Dr Verbeek have revealed the poverty of Java in minerals. Gold has been found in very small quantity, if, indeed, it actually has been found. Lead, copper, and zinc have been found in only two residencies, also in very small quantity. Coal is found only in Preanger and Bantam, but, handicapped by the want of railways and good ports in the neighbourhood of the coal-fields, not in paying quantity. Veins of iodine and salt, sulphur and marble, and latterly petroleum, particularly in Surabaya, Rembang, and Samarang, have been worked.

Cultivation and Production.—Taking as basis Dr Holle's charts and statistics and the Government Colonial Report for 1892–93, we find that 40 per cent. of the soil is under cultivation. Bantam and Besuki have each 16 per cent. of land under cultivation; Krawang, 21 per cent.; Preanger, 23 per cent.; Rembang, 30 per cent.; Japara, 62 per cent.; Surabaya, 65 per cent.; Kedu, 66 per cent.; Samarang, 67 per cent. Proceeding along the south coast from its west end, we find that in Bantam all the land cultivated on its south shore amounts to at most but 5 per cent. of that regency; in Preanger and Banyumas, as far as Tjilatjap, the land under cultivation amounts at a maximum to 20 per cent. East of Surakarta the percentages of land on the south coast under cultivation decline from 30 to 20 and 10. East of the residency of Probolinggo the percentage of land cultivated on the south coast sinks to as low as 2. On the north coast, in Krawang and Rembang, with their morasses and double chains of chalk, there are districts with only 20 and 10 per cent. of the soil under cultivation. In the residencies, on the other hand, of Batavia, Cheribon, Tegal, Samarang, Japara, Surabaya, and Pasuruan, there are districts having 80 to 90 per cent. of soil, and even more, under cultivation.

The agricultural products of Java must be distinguished into those raised by the natives for their own use and those raised for the Government and private proprietors. The land assigned to the natives for their own culture and use amounts to about 9,625,000 acres. In western Java the prevailing crop is rice, less prominently cultivated in middle Java, while in eastern Java and Madura other articles of food take the first rank. The agricultural produce grown on the lands of the Government and private proprietors, comprising an area of about 3½ million acres, consists of sugar, cinchona, coffee, tobacco, tea, indigo, &c. The number of factories for the manufacture of sugar was, in 1881, 42; in 1890, 57; in 1899, 144; and the production in these three years was, in piculs, each of 135,872 ℔ avoir., respectively 528,420, 1,512,955, and 9,792,957. The average production per backu (1¾ acres) of cultivated land rose from 52·88 piculs in 1881 to 110·91 piculs in 1899. About 4 million piculs are exported to the United States and Canada, 2 millions to China, and 1½ millions to Europe. The total crop of sugar in 1899 amounted to 11,895,010 piculs (or 796,324 tons), against 11,349,523 piculs (or 689,104 tons) in 1898 and 9,025,617 piculs (or 546,760 tons) in 1897. About 6,600,000 ℔ of cinchona are annually raised. The export of cinchona bark from Java amounted in 1899 to 11,221,000 Amsterdam ℔ (1 Amst. ℔ = 1·0893 ℔ avoir.), against 11,150,000 Amst. ℔ in 1898, and 8,511,000 Amst. ℔ in 1897. The production of coffee for the Government, often 1 million piculs in a year between 1874 and 1884, amounted in 1890 to 96,000 piculs; in 1892 to 693,000; in 1893 to 69,000; in 1897 to 474,000; and in 1899 to 198,858; the amounts for 1890 and 1893 being minimum yields. The production of coffee on private property increased from 120,000 piculs in 1890 to 550,000 piculs in 1893. The total crop of coffee in 1899 was 44,900 tons, against 29,827 tons in 1898 and 55,280 tons in 1897. In the production of coffee and cinchona Preanger, Pasuruan, and Tegal take the first place. Java tobacco, amounting to about 35,200,000 ℔ avoir. a year, is cultivated almost exclusively in eastern Java. The tobacco crop of 1899 amounted to 53,417,672 ℔ avoir., against 49,853,656 ℔ in 1898 and 30,223,416 ℔ in 1897. The tea crop was, in 1899, 12,841,702 ℔; in 1898, 12,110,724 ℔; in 1897, 11,218,559 ℔; and in 1896, 9,568,732 ℔. The production of indigo in 1899 amounted to 1,784,553 ℔, against 2,555,133 ℔ in 1898 and 2,107,921 ℔ in 1897, the falling-off being due to the fall in prices and consequent reduction in the area of land laid out. The production of cocoa in 1899 was 2,116,976 ℔, against 2,073,592 ℔ in 1898, 1,920,184 ℔ in 1897, and 1,784,875 ℔ in 1896. The production of nutmegs was 241,000 ℔, and of mace 33,048 ℔ in 1899, against 182,784 ℔ of nutmegs and 87,176 ℔ of mace in 1898, 81,600 ℔ of nutmegs and 12,452 ℔ of mace in 1897. The rice raised for export in 1899 amounted to 43,265 tons, against 36,211 tons in 1898 and 18,236 tons in 1897. The yield of pepper in 1899 amounted to 18,840,272 ℔, against 8,686,864 ℔ in 1898 and 12,409,184 ℔ in 1897. In 1899, 499,703 hides were exported; in 1898, 504,058. Of arrack 430,274 gallons were exported in 1899, against 404,477 gallons in 1898 and 499,016 gallons in 1897. In 1899, 45,331 tons of copra were exported, against 2467 tons in 1898, 5541 tons in 1897, and 19,122 tons in 1896.

Live Stock.—As in agricultural products, so also in cattle-rearing, western Java is distinguished from middle and eastern Java. There were, in 1895, 2,643,223 buffaloes, 2,572,231 head of cattle, 485,567 horses, numbers which underwent no material alteration in succeeding years. The average distribution of buffaloes is 106 per 1000 inhabitants, varying considerably in different districts, being greatest in western Java. The fact that rice is the prevailing culture in the west, while in eastern Java other plants constitute the chief produce, explains the larger number of buffaloes found in western Java, these animals being more in requisition in the culture of rice.

Shipping and Commerce.—The total tonnage of sailing and steam vessels chartered in 1899 amounted to 678,671 tons, against 555,718 tons in 1898. The total number of steam vessels entered in 1899 at the ports of Batavia, Samarang, and Surabaya, was 2146 of 2,840,159 tons. The total number of sailing vessels entered in 1899 at these ports was 264 of 151,056 tons. The steam vessels that cleared at these ports in 1899 was 2173 of 2,749,386 tons, while the sailing vessels that cleared numbered 258 of 146,115 tons. In addition to the agricultural exports, tin was exported, from Banka and Billiton through Java, in 1899 to the amount of 16,807 tons, against 14,128 tons in 1898. The imports into Java (and Madura) in 1899 included cotton goods bleached, from Holland, of the value of £616,124, against £738,770 in 1898; and, from Great Britain, in 1899, £395,729, against £326,593 in 1898; cotton goods, printed and coloured, from Holland, £364,321, against £333,159 in 1898; and from Great Britain in 1899 £414,310, against £395,404 in 1898. Petroleum, 13,258,419 gallons, against 16,144,942 gallons in 1898.

The Java Bank has a capital of £500,000 and a reserve of about £100,000. In March 1900 there were notes in circulation to the value of £5,049,250, and bank operations to the value of £2,718,583. The amounts deposited in the Post Office Savings Bank in 1900 were: Europeans, 2,521,963 florins; natives, 266,003 fl.; Chinese and other Asiatics, 50,021 fl.; or a total of 2,837,987 fl.

Roads and Railways.—Unless for purposes of defence and political communications, the roads and railways under the management of the Government avoid the uninhabited mountain chains of sandstone and chalk. For the most part they follow the fertile plains and table-lands along the coast and between the volcanoes. Besides the Kalisat–Banyuwangi Extension Railway there is the Batavia–Anjer line, which was opened as far as Serang in July 1900. Altogether there were in 1900 in Java 1106 miles of railway and 414 miles of tramway. There are also 344 post and telegraph stations. The Dutch Steam Navigation Company has 31 steamers running through the whole archipelago.

Indië*, being official publications of the Dutch and Dutch East-Indian Government. (C. M. K.)

Recent History.—Being the principal Dutch colony in the Malay Archipelago, Java was the first to benefit from the material change which resulted from the introduction of the *Grondwet* or Fundamental Law of 1848 in Holland. The main changes were of an economical character, but the political developments were also important. Since 1850 Dutch authority has steadily advanced, principally at the expense of the semi-independent sultanates in central Java, which had been allowed to remain after the capture and exile of Dipâ Negârâ, the last Javanese prince, who claimed the whole island, a man as capable as he was unscrupulous, as bold as he was influential. To subdue him and his following taxed all the resources of the Dutch Indian army for a period of five years, and cost it the loss of 15,000 officers and soldiers, besides millions of guilders. Nor did his great influence die with him when his adventurous career came to a close in 1855 at Macassar. Many Javanese, who dream of a restoration of their ancient empire, do not believe even yet that Dipâ Negârâ is dead. They are readily persuaded by fanatical *hadjees* that their hero will suddenly appear to drive away the Dutch and claim his rightful heritage. Several times there have been political troubles in the native states of central Java, in which Dipâ Negârâ's name was used, notably in 1883, when many rebellious chieftains had to be exiled. Similar attempts at revolt had been made before, mainly in 1865 and 1870, but none so serious perhaps as that in 1849, in which a son and a brother of Dipâ Negârâ were implicated, whose avowed aim was to deliver and reinstate the latter. All such attempts proved as futile there as others in different parts of Java, especially in Bantam, where the troubles of 1850 and 1888 had a religious origin, and in the end they directly contributed to the consolidation of Dutch sway. The power of the sultans of Jokjokarta and Surakarta has diminished; in 1863 Dutch authority was strengthened in the neighbouring island of Madura, and Bantam has lost every vestige of semi-independence. Everywhere, in fact, since 1850 the position of the Dutch in Java has become much stronger. Their increase in power has largely resulted from a more statesmanlike and more generous treatment of the natives, who have been educated to regard the *Orang blanda*, or white man, as their protector against the native rulers. Thus, in 1866, passports for natives in Java, when travelling, were abolished by the then Governor-General, Dr Sloet van de Beele, who also introduced many reforms, reducing the *corvée* in the Government plantations to a minimum, and doing away with the monopoly of fisheries. Six years later a primary education system for the natives, and a penal code, whose liberal provisions seemed framed for Europeans, were introduced. Material welfare was also promoted by lines of steamships between Java and the other islands, all belonging to a Royal Packet Company, established in 1888 under a special statute, and virtually possessing a monopoly on account of the Government mail contracts; as well as by the construction of a system of railways, which, gradually extending in all directions, now enable the traveller to cover the whole of Java in a few days. The earliest Java lines, between Batavia and Buitenzorg, its pleasant suburb, and between Samarang and the capitals of the sultanates, were built, about 1870, by a private company with a State guarantee. Since 1875, when the late Dr van Goltstein, then a cabinet minister and afterwards Netherlands minister in London, had an Act passed for the construction of State railways in Java, their progress has become much more rapid. In addition, several private companies have built either light railways or tramways. Telegraphs have also been extensively laid between Java and the other islands of the archipelago—Java forming an important link in the cable communication with Australia. The services for passengers, goods, and mails from Europe to Java, and *vice versâ*, have also improved since the establishment of the Netherland and Rotterdam Lloyd Steamship Companies. The construction of large harbour works at Tandjong Priok, near Batavia, which took eight years to build (1877–85), contributed to the increased prosperity of Java during the second half of the 19th century—a progress all the more remarkable because of industrial and agricultural depression. Among the exceptions, the chief one to be noted is the petroleum industry. In 1875 the existence of petroliferous deposits in Java was not so much as suspected, but at the beginning of the present century several large companies were successfully at work in Surabaya, Samarang, and Rembang, the principal petroleum centres of Java to-day.

For the recent history of Java, consult the works mentioned under HOLLAND and MALAY ARCHIPELAGO; also Prof. P. J. VETH's *Java* (in Dutch), an indispensable and masterly compendium largely based upon JUNGHUHN's description. The second edition of VETH's *Java*, much enlarged and brought up to date, is in course of publication. Haarlem, 1895 *et seq.* (H. TI.)

Jawhar, a native state of India, in the Konkan division of Bombay, situated among the lower ranges of the Western Ghats. Area, 534 square miles. The population in 1881 was 48,556; in 1891, 52,831; average density, 99 persons per square mile. In 1901 the population was 47,264, showing a decrease of 11 per cent. The estimated gross revenue is Rs.1,57,520, of which Rs.37,063 was expended on public works in 1897–98; no tribute; number of police, 41; number of schools, 8, with 449 pupils. The chief, who is a Koli by caste, traces back his descent to 1343. The town of JAWHAR is 50 miles north-east of Thana, on a plateau about 1000 feet above the sea. Population (1891), 2991.

Jaworów, the chief town of a district in the Austrian crownland of Galicia, 30 miles west of Lemberg. It has a pottery, a brewery, and a distillery, and some trade in agricultural produce. In 1890 the commune had a population of 9219 Ruthenians and Poles, including 2572 Jews; (1900), 10,090.

Jaworzno, a market-place in the Galician government district of Chrzanów, Austria, 30 miles west of Cracow, and a station on the Ferdinands-Northern Railway. It has important coal-mines, deposits of calamine or hydrous silicate of zinc, smelting furnaces for this ore, and a glass factory. Population, mostly Polish (1890), 6637; (1900), 9206.

Jeannette, a borough of Westmoreland county, Pennsylvania, U.S.A., on the Pennsylvania Railroad. It is situated in the natural-gas territory, and has extensive glass factories. Population (1890), 3296; (1900), 5865, of whom 1340 were foreign-born.

Jebrail, a district town of Russia, Transcaucasia, government and 105 miles south-south-east of Elisabethpol, one of the chief custom-houses for trade with Persia.

Jedburgh, a royal burgh and the county town of Roxburghshire, Scotland, on the Jed water, 56 miles south-east of Edinburgh by rail. Its constituency was merged in that of the county in 1885. The town has five woollen mills. The ruined abbey was acquired from the heritors by the marquis of Lothian in 1875 in exchange for a fine church and manse. There are two public parks, a new public hall (in place of the Corn Exchange burned down), and a free library. A new grammar school, built in 1883, is the only public school. Population (1881), 3400; (1901), 2222.

Jedlersdorf, officially *Gross-Jedlersdorf*, an industrial village in the government district of Floridsdorf, in Lower Austria, situated in the Marchfeld, north of Vienna.

It has extensive railway works and manufactures of machinery, screws, malt, yeast, gutta-percha, &c. Population (1890), 2038; (1900), 2607.

Jefferies, Richard (1848–1887), English naturalist and author, was born on 8th November 1848, at a farmhouse called Coate, which stands about 2½ miles from Swindon, on the road to Marlborough, Wiltshire, England. He was sent to school, first at Sydenham and then at Swindon, till the age of fifteen or so, but his actual education was at home, at the hands of his father, who gave him his love for Nature and taught him how to observe. For the faculty of observation, as Jefferies, Gilbert White, and Thoreau have remarked, several gifts are necessary, including the possession of long sight and quick sight, two things which do not always go together. To them must be joined trained sight and the knowledge of what to expect. The boy's father first showed him what there was to look for in the hedge, in the field, in the trees, and in the sky. This kind of training would in many cases be wasted: to one who can understand it, the book of Nature will by and by offer pages which are blurred and illegible to the city-bred lad, and even to the country lad the power of reading them must be maintained by constant practice. To live amid streets or in the working world destroys it. The observer must live alone and always in the country; he must not worry himself about the ways of the world; he must be always, from day to day, watching the infinite changes and variations of Nature. Perhaps, even when the observer can actually read this book of Nature, his power of articulate speech may prove too imperfect for the expression of what he sees. But Jefferies, as a boy, was more than an observer of the fields; he was bookish, and read all the books that he could borrow or buy. And presently, as is apt to be the fate of a bookish boy who cannot enter a learned profession, he became a journalist and obtained a post on the local paper. He developed literary ambitions, but for a long time to come was as one beating the air. He tried local history and novels; but his early novels, which were published at his own risk and expense, were, deservedly, failures. In 1872, however, there appeared a remarkable letter in *The Times* from him, on "The Wiltshire Labourer," full of original ideas and of facts new to most readers. This was in reality the turning-point in his career. In 1873, after more false starts, Jefferies returned to his true field of work, the life of the country, and began to write for *Fraser's Magazine* on "Farming and Farmers." He had now found himself. The rest of his history is that of continual advance, from close observation becoming daily more and more close, to that intimate communion with Nature with which his later pages are filled. The developments of the later period are throughout touched with the melancholy that belongs to ill-health. For, though in his prose poem called "The Pageant of Summer," the writer seems absolutely revelling in the strength of manhood that belongs to that Pageant, yet, in the "Story of my Heart," written about the same time, we detect the mind that is continually turned to death. He died at Goring, worn out with many ailments, on 14th August 1887. The best-known books of Richard Jefferies are:—*The Gamekeeper at Home* (1878); *The Story of my Heart* (1883); *Life of the Fields* (1884), containing the best paper he ever wrote, "The Pageant of Summer"; *Amaryllis at the Fair* (1884), in which may be found the portraits of his own people; and *The Open Air*. He stands among the scanty company of men who address a small audience, for whom he read aloud these pages of Nature spoken of above, which only he, and the few like unto him, can decipher. (W. BE.)

Jefferson City, capital of Cole county and of the state of Missouri, U.S.A., on the south bank of the Missouri, at an altitude of 555 feet. The Missouri Pacific, the Chicago and Alton and the Missouri, Kansas and Texas Railways pass through it. Its site is partly in the bottom-lands of the river and partly on the steep banks. Population (1890), 6742; (1900), 9664, of whom 786 were foreign-born and 1822 negroes.

Jefferson, Joseph (1829–——), American actor, was born at Philadelphia on the 20th of February 1829. He was the third and most famous actor of this name, and perhaps the most famous of all American comedians. In childhood he appeared as a supernumerary, and followed the company of which his father and mother were members throughout the west and south, becoming himself a stock actor and manager. His first pronounced success was made in 1858 as Asa Trenchard in Tom Taylor's *Our American Cousin*. The naturalness and spontaneity of humour with which he acted the love scenes revealed a spirit in comedy new to his contemporaries, long used to a more artificial convention; and the touch of pathos which the part required revealed no less to the actor an unexpected power in himself. Other early parts were Newman Noggs in *Nicholas Nickleby*, Caleb Plummer in *The Cricket on the Hearth*, Dr Pangloss in *The Heir at Law*, Salem Scudder in *The Octoroon*, and Bob Acres in *The Rivals*, the last part being not so much an interpretation of the character as Sheridan sketched it as a creation of the actor's. In 1859 Jefferson made a dramatic version of the story of *Rip Van Winkle* on the basis of older plays, and acted it with success at Washington. The play was given its permanent form by Dion Boucicault (1865) in London, where it ran 170 nights, with Jefferson in the leading *rôle*. Jefferson continued to act with undiminished popularity in a limited number of parts in nearly every town in the United States, his Rip Van Winkle, Bob Acres, and Caleb Plummer being the most popular. He was one of the first to establish the travelling "combinations" which superseded the old system of local stock companies. With the exception of minor parts, such as the First Gravedigger in *Hamlet*, which he played in an "all star combination" headed by Edwin Booth, Jefferson created no new character after 1865; and the success of Rip Van Winkle was so pronounced that he has often been called a one-part actor. He devoted much of his time to painting. The *Autobiography of Joseph Jefferson* (New York, 1889) is written with admirable spirit and humour, and its judgments with regard to the art of the actor and of the playwright will probably entitle it to a place beside *An Apology for the Life of Colley Cibber*.

Jeffersonville, capital of Clark county, Indiana, U.S.A., on the north bank of the Ohio, opposite Louisville, Kentucky, with which it is connected by several bridges. It is on the Baltimore and Ohio South-Western and the Pittsburg, Cincinnati, Chicago and St Louis Railways, and is at an altitude of 441 feet. It is at the head of the falls, which descend 26 feet in two miles, giving abundant water power, which is utilized in manufactures both here and in Louisville. Population (1890), 10,666; (1900), 10,774, of whom 615 were foreign-born and 1818 negroes.

Jeisk, a district town of Russia, northern Caucasia, in Jeisk Bay, in the north-east of the Sea of Azov, province of Kubañ, 140 miles north-west of Ekaterinodar. Owing to its situation amidst a fertile region, its exports of corn, wool, and linseed are of some importance. Population (1897), 20,706.

Jena, a town of Germany, grand-duchy of Saxe

Weimar, on the Saale, 28 miles by rail east of Erfurt (14 east of Weimar), the seat of the joint university of the Saxon duchies; in 1900 nearly £40,000 was voted for providing new university buildings. Amongst the famous Jena professors have been Schiller, Oken, Fichte, Schelling, and Hegel. In 1900 the university was attended by 758 students, and had 97 professors. Its library now numbers 200,000 volumes. Jena is the seat of a veterinary school, an agricultural institute, a new astronomical observatory, all connected with the university; and in 1900 it was proposed as the seat of a technical high school for the Saxon duchies. There are monuments to Bismarck (1892), Fritz Reuter (1888), and the students' societies of the first half of the 19th century, the *Burschenschaften* (1883), by Donndorf. The Lichtenhainer beer, brewed in the villages adjacent (Lichtenhain, Zeigenhain, Wöllnitz, &c.), is widely celebrated. Population (1885), 11,680; (1900), 20,677.

Jenkin, Henry Charles Fleeming (1833–1885), British engineer, was born near Dungeness on 25th March 1833, his father (died 1885) being a naval commander, and his mother (died 1885) a novelist of some literary repute (her best books perhaps being *Cousin Stella*, 1859, and *Who Breaks, Pays*, 1861). Fleeming Jenkin was educated at first in Scotland, but in 1846 the family went to live abroad, owing to financial straits, and he studied at Genoa University, where he took a first-class degree in physical science. In 1851 he began his engineering career as apprentice in an establishment at Manchester, and subsequently he entered Newall's submarine cable works at Birkenhead. In 1859 he began, in concert with Sir William Thomson (afterwards Lord Kelvin), to work on problems respecting the making and use of cables, and the importance of his researches on the resistance of gutta-percha was at once recognized. From this time he was in constant request in connexion with submarine telegraphy, and he became known also as an inventor. In 1865 he was elected F.R.S., and was appointed professor of engineering at University College, London. In 1868 he obtained the same professorship at Edinburgh University, and in 1873 he published a text-book of *Magnetism and Electricity*, full of original work. He was the author of the article BRIDGES in the ninth edition of this Encyclopædia. His influence among the Edinburgh students was pronounced, and R. L. Stevenson's well-known *Memoir* is a sympathetic tribute to his ability and character. His interests were by no means confined to engineering, but extended to the arts and literature; his miscellaneous papers, showing his critical and unconventional views, were issued posthumously in two volumes (1887). In 1882 Jenkin invented an automatic method of electric transport for goods—"telpherage," but before he could complete its details he died (12th June 1885). A telpher line on his system was subsequently erected at Glynde in Sussex. Fleeming Jenkin was also well known as a sanitary reformer, and during the last ten years of his life he did much useful work in inculcating more enlightened ideas on the subject both in Edinburgh and outside.

Jenner, Sir William, 1st BARONET (1815–1898), English physician and surgeon, was born at Chatham on 30th January 1815, and educated at University College, London. He became M.R.C.S. in 1837, and F.R.C.P. in 1852, and in 1844 took the London M.D. degree. In 1847 he began at the London Fever Hospital investigations into cases of "continued" fever which enabled him finally to make the distinction between typhus and typhoid with which his reputation as a pathologist is principally connected. In 1849 he was appointed professor of pathological anatomy at University College, and also assistant physician to the hospital; afterwards he held other professorships there, and was physician (1854–76) and consulting physician (1879), besides holding similar appointments at other hospitals. He was President of the College of Physicians (1881–88), President of the Epidemiological Society (1866–68), of the Pathological Society (1873–75), and of the Clinical Society (1875); he was elected F.R.S. in 1864, and received honorary degrees from Oxford, Cambridge, and Edinburgh. He was in constant attendance on the Royal Family. In 1861 he was appointed physician extraordinary to Queen Victoria, in 1862 physician in ordinary, and in 1863 physician in ordinary to the prince of Wales, and he attended both the Prince Consort and the prince of Wales in their attacks of typhoid fever. In 1868 he was created a baronet. As a consultant Sir William Jenner had a great reputation, and he left a large fortune when he died on 11th December 1898, having then retired from practice for eight years owing to ill-health.

Jerez de la Frontera, a town of Spain, in the province of Cadiz, on the railway from Cadiz to Seville. Its population is decreasing, and was only 55,951 in 1897. With the growth of its wine trade and its commerce in agricultural products, however, Jerez has become one of the most important cities of southern Spain. The modern buildings are of handsome appearance, and include the institute, 14 primary schools, a state remount and stud, an academy of law, a school of medicine, a fine arts and Philharmonic academy, model farms, a commercial experts' school, a chamber of commerce, several casinos, orphanages for both sexes, hospitals, and a reformatory. There are also public gardens, and tramways have been laid down. The vineyards around Jerez furnish in reality only part of the wine actually exported and labelled Vino de Jerez. In 1898 this amounted to 4,949,100 gallons. The export of wine is no longer confined practically to Great Britain. In 1898 the export to France was valued at £170,908, and that to England at only £167,827, the total exports being valued at £497,904. The district has earned a reputation for being disaffected, and has frequently been the scene of anarchical outbursts.

Jericho, now ERÍHÁ, 820 feet below the level of the sea, a village in the Jordan valley, east-north-east of Jerusalem. It forms part of one of the large estates owned by the Sultan in Palestine, and is a centre of administration under a Mudír. An aqueduct has been built and much waste land has been brought under cultivation. Clearances in the jungle east of ʿAin es-Sultán, "Elisha's fountain," have brought to light several remains of Roman and Byzantine Jericho. There are Greek and Russian churches and monasteries.

Jersey. See CHANNEL ISLANDS.

Jersey City, capital of Hudson county, New Jersey, U.S.A., the second city in size in the state and its principal seaport, on the Hudson river, opposite New York, of which it is a part commercially and industrially. It is well paved, most of its streets being of either granite blocks or asphalt; it has a good water-supply and is well sewered, and is progressive in all matters of municipal government and improvement. It is the terminus of several steamship lines from Europe and the south of the United States, and of most of the railway lines from the south and west to New York. These lines are connected with New York by ferries. Of the foreign commerce it is impossible to supply figures, as the city is included in the port of New York, for which alone statistics are given. Although Jersey City is mainly a commercial city, its

manufactures are of much importance. In 1890 it contained 726 establishments, with a total capital of $18,165,094. They employed 12,869 hands, and their yield had a value of $37,376,322. The principal were meat, the product of slaughtering and meat-packing establishments, $10,624,859; soap and candles, $1,554,270; chemicals, $1,804,339; foundry and machine shop products, $1,822,104; cars, $1,484,423; and silk goods, $1,066,000. The assessed valuation of real and personal property in 1900 was $93,325,000, the net debt was $16,701,353, and the rate of taxation was $28.20 per $1000. The total receipts for the fiscal year were $7,433,501, and the expenditures were $6,811,104. Population (1880), 120,722; (1890), 163,003; (1900), 206,433, of whom 58,424 were foreign-born and 3704 negroes. There were 63,495 persons of school age (5 to 20 years). Of 60,319 males 21 years of age and over, 3094 were illiterate (unable to write), of whom only 192 were native-born.

Jerusalem.—Letters found at Tell el-'Amarna, which were written by an early ruler of Jerusalem, show that the name existed under the form *Urusalim*—that is, "city of Salim," or "city of peace"—many years before the Israelites entered Canaan. Jerusalem was then one of the most important cities in southern Palestine, subject to Egypt, and ruled by princes, or possibly priest-kings, who were appointed by the Pharaoh.

Natural Topography and Results of Excavations.

Since the termination of Sir C. Warren's noteworthy researches in 1870, excavations have been made for the Palestine Exploration Fund by M. Clermont-Ganneau, 1873–74, and Dr Bliss, 1894–97; for the German Palestine Society by Professor Guthe, in 1881; by the Russian Palestine Society; and by the German Government. Information, chiefly derived from excavations made for building purposes, has also been collected by Dr Schick, Père Vincent, and others.[1] Much light has been thrown on the course of the old walls, but excavations are still necessary at several points to disclose the original form of the ground upon which the city was built.

Jerusalem is a mountain city—the highest point within the walls is 2570 feet above the sea—situated in the heart of the hill country of southern Palestine, amidst limestone hills which are seamed by countless ravines. It has been connected with Jaffa by a railway, but a few years ago it could only be approached by rough mountain roads. Thus, though close to, it was in a sense remote from the maritime plain along which the great highway of the nations formerly ran. The city occupies the lower extremity of a limestone plateau, barely 1000 acres in extent, which projects southwards from the central watershed of the country, and is bounded on the east by Wádi Sitti Maryam, valley of the Kidron, and on the west by Wádi Rabábi, valley of Hinnom. These valleys unite beneath the south-east corner of the plateau after a fall of 670 feet, and for some distance above their junction are deep rocky ravines. The city is thus easily accessible from the north, whilst on all other sides it is protected by nature. The little plateau is itself divided into two spurs of unequal size by a ravine, called by Josephus "Tyropœon," which joins the Kidron at Siloam. The western spur, upon which stood the palace of Herod and the "Upper City" of Josephus, is the broader and higher. The eastern, Mount Moriah, on which the Temple was built, is, so far as it lies within the walls, a narrow ridge of rock, of which the exact form is still imperfectly known. Towards the north this spur is cut into by a short deep ravine, possibly the "ravine called Kedron" of Josephus, which runs through the north-east corner of the city and joins the Kidron near the "Golden Gate." The sides of the ravines are covered with the ruins of ancient Jerusalem, and their beds are concealed by *débris*, which in one place is 125 feet deep. The geological structure of the plateau—thin beds of hard silicious chalk, locally called *misse*, overlying a thick bed of soft white limestone, *meleke*—facilitated in many ways the growth of the city. Excellent building material was obtained from both beds, whilst in the *meleke* were hewn underground chambers, tanks, cisterns, tombs, aqueducts, and drains. The plateau is arid. The only known spring is the "Fountain of the Virgin," in the Kidron valley, and the only deep well is Bír Eyúb, below the junction of the Kidron and Hinnom valleys. The city was consequently dependent upon rain-water, collected and stored in tanks and cisterns, and upon water brought from a distance by aqueducts. Many interesting remains of these works are visible. Since 1865 several projects have been brought forward for the improvement of the water-supply.

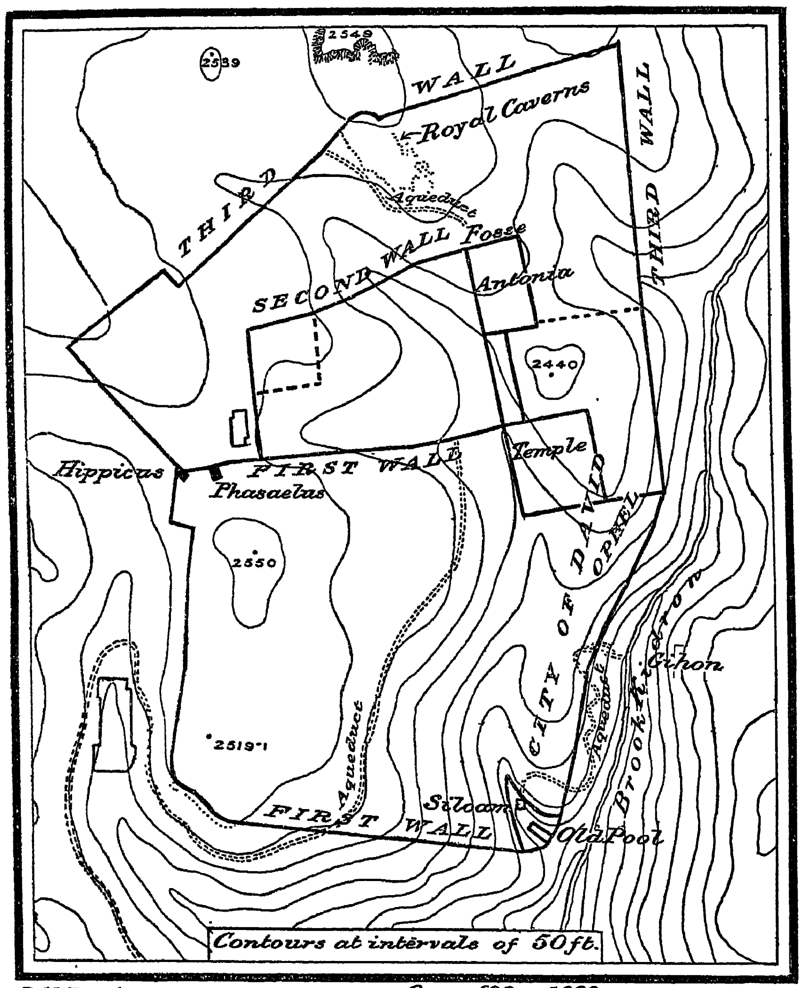
The extensive building operations north of the city have brought to light no trace of any rock-hewn ditch, nor of any masonry that could have formed part of a wall erected for purposes of defence. This strongly supports the view that the present north wall follows closely the line of that which is called by Josephus the "third wall." South of the city Dr Bliss ascertained the course of the wall from the south-west angle of the existing fortifications to Siloam. Several building periods were recognized, and it was found that whilst at one time the wall excluded the two pools of Siloam, at another it was carried across the dam of the lower pool so as to include them. The form and size of the two pools, and the remains of the church at Siloam, mentioned by pilgrims before the Arab conquest, were discovered at the same time; and light was thrown on the ancient system of drainage, and on the course of the mediæval walls on the western spur. Amongst other discoveries are the ruins of the Church of St Stephen, built by the Empress Eudocia in 460; of the Church of St Mary-the-Less; of portions of the buildings erected by Constantine near the reputed sepulchre of Christ; and of the mediæval Church and Pool of Bethesda.

Ancient Jerusalem.

Jerusalem, when the Israelites entered Palestine, probably consisted of a walled town and acropolis on the eastern spur, and of a small suburb on the lower slopes of the western spur. The town was captured and burned by Judah, but the acropolis, or stronghold of Zion, held out until it was stormed by Joab. David strengthened the acropolis and made it his residence, whence it was called the "City of David," a name that was soon extended to all that part of the city which lay on the eastern spur. Under Solomon, Jerusalem became the religious and political centre of the Hebrews; there was a great development of trade, and a period of prosperity, during which the city was enlarged and fortified, and the Temple and the royal palace were built. The large increase of the population was met by enclosing that portion of the western spur which lay south of the Jaffa Gate, and joining it to the City of David. Special attention was paid to the fortifications by Uzziah, Jotham, Hezekiah, and Manasseh; and it was probably Hezekiah who built the "second wall" to protect a suburb which had grown up to the north of Solomon's wall on the western spur. Hezekiah also greatly improved the water-

[1] See *Quarterly Statements of Pal. Exp. Fund*, the *Zeitschrift d. Deutschen Pal. Vereins*, and the *Revue Biblique*.

supply of the city. After the Captivity, Nehemiah rebuilt the walls on the old lines, and it is impossible to reconcile his account of their restoration and dedication with the theory that the city was then confined to the eastern spur.[1] During the five centuries that intervened between Nehemiah and Herod, no occasion arose for a large extension of the city's limits, and no record has survived of the execution during that period of a work of such magnitude as the fortification of the western spur with a great wall standing above a rock-hewn scarp. According to the writer's view, Jerusalem, in the reign of Hezekiah, was practically coextensive with the walled city of Herod.



B. V. Darbishire & O. J. R. Howarth, 0 500 1000 feet. Oxford, 1901.

PLAN OF THE THREE WALLS OF JERUSALEM.

Nehemiah mentions the gates and towers of the walls under their old names, and various attempts have been made to reconstruct pre-exilic Jerusalem from his description.[2]

Nehemiah, when restoring the walls, must have rebuilt the acropolis, of which the towers of Meah and Hananeel possibly formed part. It is apparently mentioned as the "castle (Birah) that appertaineth to the house" (Neh. ii. 8); and may have been the fortress which, according to Aristeas, stood on a commanding eminence to the north of the Temple. That position was certainly occupied by the Acra, or acropolis, built by Antiochus Epiphanes, 187–168 B.C., which is described as being in close proximity to and overlooking the Temple (1 Macc. iv. 41; Josephus, *Ant.* xii. 5, § 4). As in the earlier case of the City of David, the name of the citadel, "Acra," was popularly applied to the spur. After the demolition of the Macedonian fortress a portion of its site was reoccupied by the Baris of Hyrcanus, and this in turn was replaced by Herod's castle called Antonia. The city as it existed at the time of the siege by Titus, and the important buildings erected by Herod, are described by Josephus. On the eastern spur stood the Temple, connected by colonnades with the castle of Antonia; the palaces of Helena, Monobazus, and Grapte; and the hippodrome. On the western were Herod's fortress-palace with its three lofty towers, and the palace of Agrippa. The northern side of the city was then defended by three walls, and with regard to the position of the "first," or oldest, there are few differences of opinion. But it is still a question whether the "second" wall included or excluded the Church of the Holy Sepulchre; and whilst some authorities identify the line of the "third" wall with that of the present north wall of the city, others draw it so as to enclose a large additional area on the north-west. The two questions upon which, perhaps, there has been most controversy are the site of the Temple of the Jews and that of the tomb of Christ. It is agreed that the Temple stood within the limits of the enclosure known as the Harám esh-Sherif, but there is a divergence of opinion as to the exact position within that area occupied by the building and its courts. It has been maintained on the one hand that the Temple occupied the south-west corner of the Harám, and on the other that it stood near the centre of the same enclosure.[3] Both views present difficulties which can only be solved by excavation. The Church of the Holy Sepulchre stands on the ground which was once occupied by the churches erected by Constantine over and adjoining the rock-hewn tomb which he believed to be that of Christ. It has been maintained, however, that the information at the disposal of the Emperor and his advisers was not sufficient to enable them to determine the exact position of Golgotha, and that the place selected must have been within the "second" wall of Josephus, and so not genuine. Several opinions have been expressed with regard to the position of Golgotha by those who reject the site honoured by Constantine. Amongst these the view of Otto Thenius, published in 1849, that Christ was crucified on the hillock above "Jeremiah's Grotto," outside the Damascus Gate, has attracted most attention from its adoption by General Gordon. This identification rests on no evidence and no tradition, and is simply a guess. In the absence of any precise indication of direction in the Bible there can be no certainty; but if excavations ever show that the Church of the Holy

[1] The area of this spur is 255,939 square yards, which, allowing 30 square yards per person—a high allowance, considering that the Temple, acropolis, and palaces are included—would give a population of 8531.

[2] The reconstruction suggested by the writer, which differs from that proposed by the late Professor Robertson Smith in the 9th edition of this Encyclopædia, is given in Smith's *Dictionary of the Bible*, 2nd ed., art. JERUSALEM.

[3] A discussion of the whole question by the writer will be found in Smith's *Dictionary of the Bible*, 2nd ed., art. JERUSALEM, pp. 1634–42. For the first theory see Fergusson, *The Temples of the Jews*; for the second, Warren, *Underground Jerusalem*, and *The Temple or Tomb*; Conder, *Tent Work in Palestine*.

Sepulchre is outside the "second" wall, it will be difficult to dispute the authenticity of the sites it covers.

Modern Jerusalem.

Jerusalem is the chief town of a sanjak, governed by a *mutesarrif*, who reports directly to the Porte. It has the usual executive and town councils, upon which the recognized religious communities, or *millets*, have representatives; and it is garrisoned by infantry of the fifth army corps. The city is connected with its port, Jaffa, by a carriage road, forty-one miles, and by a metre-gauge railway, fifty-four miles, which was completed in 1892, and is worked by a French company. There are also carriage roads to Bethlehem, Hebron, and Jericho. Prior to 1858, when the modern building period commenced, Jerusalem lay wholly within its 16th-century walls, and even as late as 1875 there were few private residences beyond their limits. At present Jerusalem without the walls covers a larger area than that within them. The growth has been chiefly towards the north and north-west; but there are large suburbs on the west, and on the south-west near the railway station on the "Plain of Rephaim." The village of Siloam has also increased in size, and the western slopes of Olivet are being rapidly covered with churches, monasteries, and houses. Amongst the most marked features of the change that has taken place since 1875 are the growth of religious and philanthropic establishments; the settlement of Jewish colonies from Bokhara, Yemen, and Europe; the migration of Europeans, old Moslem families, and Jews from the city to the suburbs; the increased vegetation, due to the numerous gardens and improved methods of cultivation; the substitution of timber and red tiles for the vaulted stone roofs which were so characteristic of the old city; the striking want of beauty, grandeur, and harmony with their environment exhibited by most of the new buildings; and the introduction of wheeled transport, which, cutting into the soft limestone, has produced mud and dust to an extent previously unknown. To facilitate communication between the city and its suburbs, the Báb ez-Záhire, or "Herod's Gate," and a new gate, near the north-west angle of the walls, have been opened; and a portion of the wall, adjoining the Jaffa Gate, has been thrown down, to allow free access for carriages. Within the city the principal streets have been roughly paved, and iron bars placed across the narrow alleys to prevent the passage of camels. Without the walls carriage roads have been made to the Mount of Olives, the railway station, and various parts of the suburbs, but they are kept in bad repair. Little effort has been made to meet the increased sanitary requirements of the larger population and wider inhabited area. There is no municipal water-supply, and the main drain of the city discharges into the lower pool of Siloam, which has become an open cess-pit. In several places the *débris* within the walls is saturated with sewerage, and the water of the Fountain of the Virgin, and of many of the old cisterns, is contaminated and unfit for drinking. Amongst the more important buildings for ecclesiastical and philanthropic purposes erected to the north of the city since 1860 are the Russian cathedral, hospice, and hospital; the French hospital of St Louis, and hospice and church of St Augustine; the German schools, orphanages, and hospitals; the new hospital and industrial school of the London Mission to the Jews; the Abyssinian church; the church and schools of the Church Missionary Society; the Anglican church, college, and bishop's house; the Dominican monastery, seminary, and church of St Stephen; the Rothschild hospital and girls' school; and the industrial school and workshops of the Alliance Israélite. On the Mount of Olives are the Russian church, tower, and hospice, near the Chapel of the Ascension; the French Paternoster church; the Carmelite nunnery; and the Russian church of St Mary Magdalene, near Gethsemane. South of the city are the Armenian monastery of Mount Zion and Bishop Gobat's school. On the west side are the Institution of the Sisters of St Vincent; the Ratisbon school; the Montefiore hospice; the British ophthalmic hospital of the Knights of St John; the convent and church of the Clarisses; and the Moravian leper hospital. Within the city walls are the Latin Patriarchal church and residence; the school of the Frères de la Doctrine Chrétienne; the schools and printing house of the Franciscans; the Coptic monastery; the German church of the Redeemer, and hospice; the United Armenian church of the Spasm; the convent and school of the Sœurs de Zion; the Austrian hospice; the Turkish school and museum; the monastery and seminary of the Frères de la Mission Algérienne, with the restored church of St Anne; the church, schools, and hospital of the London Mission to the Jews; the Armenian seminary and Patriarchal buildings; the Rothschild hospital; and Jewish hospices and synagogues.

The climate is naturally good, but continued neglect of sanitary precautions has made the city unhealthy. During the summer months the heat is tempered by a fresh sea-breeze, and there is usually a sharp fall of temperature at night; but in spring and autumn the east and south-east winds, which blow across the heated depression of the Ghór, are enervating and oppressive. A dry season, which lasts from May to October, is followed by a rainy season, divided into the early, winter, and latter rains. Snow falls two years out of three, but soon melts. The mean annual temperature is 62°·8 F., the maximum 112°, and the minimum 25°. The mean monthly temperature is lowest (47°·2) in February, and highest (76°·3) in August. The mean annual rainfall (1861 to 1899) is 26·06 inches. The most unhealthy period is from 1st May to 31st October, when there are, from time to time, outbreaks of typhoid, small-pox, diphtheria, and other epidemics. The unhealthiness of the city is chiefly due to want of proper drainage, impure drinking-water, miasma from the disturbed rubbish heaps, and contaminated dust from the uncleansed roads and streets. The only industry is the manufacture of olive-wood and mother-of-pearl goods for sale to pilgrims and for export. The imports (see JOPPA) are chiefly food, clothing, and building material. The population in 1899 was about 48,600 (Moslems 7700, Christians 10,900, Jews 30,000).[1] During the pilgrimage season it is increased by about 15,000 travellers and pilgrims.

[1] The number of Jews has been placed as high as 55,000, but an inquiry by the writer led him to believe that it does not exceed 30,000. The *Jewish Annual* (Luncz) published in Jerusalem gives 28,600; Baedeker 41,000.

Jesi, a town and episcopal see of the province of Ancona, the Marches, Italy, 17 miles south-west of Ancona by rail. It is a place of very considerable industry, especially silk-spinning, raising of cocoons, and manufacture of matches, also manufacture of hosiery, hats, paper, tanning, and brick-making. Jesi has a technical school. Pergolese (1710–1736), composer of a *Stabat Mater*, was born here. Population (1881), 12,118; (1899), 6200.

Jessel, Sir George (1824–1883), British judge, was born in London on the 13th of February 1824. He was the son of Zadok Aaron Jessel, a Jewish coral merchant, trading in the City of London and living in Savile Row, Piccadilly. George Jessel was educated at Mr Neumegen's school for Jews at Kew, and being prevented by then existing religious disabilities, since abolished, from proceeding to Oxford or Cambridge, went to University College, London. He entered as a student at Lincoln's Inn in 1842, and a year later took his B.A. degree at the University of London, graduating with honours in Mathematics and Natural Philosophy, gaining honours also and a prize in Vegetable Physiology and Structural Botany, and becoming M.A. and gold medallist in Mathematics and Natural Philosophy in 1844. In 1846 he became a fellow of University College, and on the 4th of May 1847 he was called to the bar at Lincoln's Inn. His earnings during his first three years at the bar were 52, 346, and 795 guineas, from which it will be seen that his rise to a tolerably large practice was rapid. His work, however, was mainly conveyancing, and for long his income remained almost stationary, so that, like many other young barristers, he declared his belief that he had mistaken his vocation. By degrees, however, he got more work, and having applied for silk and been refused it by Lord Westbury in 1861, eventually, on the recommendation of the same Lord Chancellor, was called within the bar in 1865, becoming a bencher of his Inn in the same year and practising in the Rolls Court. He entered Parliament as Liberal member for Dover in 1868, and although neither his intellect nor his oratory was of a class that would be likely to commend itself to his fellow-members of the House of Commons, he attracted the attention of Mr Gladstone by two learned and lawyer-like speeches on the Bankruptcy Bill which was before the House in 1869, with the result that when in 1871 Sir Robert Collier was made a judicial member of the Privy Council (in evasion of the Act which constituted that office), and Sir John Duke Coleridge succeeded him as Attorney-General, Jessel received the post of Solicitor-General and was knighted. His reputation at this time stood high in the Chancery Courts; on the Common Law side he was unknown, and on the first occasion upon which he came into the Court of Queen's Bench to move on behalf of the Crown, there was very nearly a collision between him and the bench, composed of Lord Chief Justice Cockburn, Mr Justice Blackburn, and Mr Justice Lush. Mr Justice Blackburn having interrupted with a question and a suggestion, Sir George answered promptly, if without heat, "Will your lordship hear the words of the statute before you rush to hasty analogies?" "Mr Solicitor," said Cockburn, as presiding judge, "we are not accustomed to be addressed in this way." Jessel made no direct reply, but continued his argument perfectly unmoved, saying only, "My Lords, when I was interrupted I was reading the words of the statute. I propose to read them to the end." He obtained the rule he asked for, and his forceful and direct method of bringing his arguments home to the bench was not modified in his subsequent practice before it. His great powers were fully recognized; his business in addition to that on behalf of the Crown became very large, and his income for three years before he was raised to the bench amounted to nearly £25,000 per annum. He had married a rich wife, so that the pecuniary loss was comparatively immaterial to him when in 1873 he succeeded Lord Romilly as Master of the Rolls, the Attorney-General having declined to exercise his own right to do so. From 1873 to 1881 Sir George Jessel sat as a judge of first instance in the Rolls Court, being also a member of the Court of Appeal. In November 1874 the first Judicature Act came into effect, and in 1881 the Judicature Act of that year made the Master of the Rolls the ordinary president of the first Court of Appeal, relieving him of his duties as a judge of first instance. In the Court of Appeal Sir George Jessel presided almost to the day of his death. For some time before 1883 he suffered from diabetes with chronic disorder of the heart and liver, but struggled against it; on the 16th of March 1883 he sat in court for the last time, and on the 21st of March he died at his house, 10 Hyde Park Gardens, London, the immediate cause of death being cardiac syncope.

As a judge of first instance Sir George Jessel was a revelation to those accustomed to the proverbial slowness of the Chancery Courts and of the Master of the Rolls who preceded him. He disposed of the business before him with rapidity combined with correctness of judgment, and he not only had no arrears himself, but was frequently able to help other judges to clear their lists. His knowledge of law and equity was wide and accurate, and his memory for cases and command of the principles laid down in them extraordinary. In the Rolls Court he never reserved a judgment, not even in the Epping Forest case (*Commissioners of Sewers* v. *Glasse*, L.R. 19 Eq. *Times*, 11th November 1874), in which the evidence and arguments lasted twenty-two days (150 witnesses being examined in court, while the documents went back to the days of King John), and in the Court of Appeal he did so only twice, and then in deference to the wishes of his colleagues. The second of these two occasions was the case of *Robarts* v. *The Corporation of London* (49 *Law Times* 455; *Times*, 10th March 1883), and those who may read Jessel's judgment should remember that, reviewing as it does the law and custom on the subject, and the records of the City with regard to the appointment of a Remembrancer from the 16th century, together with the facts of the case before the court, it occupied nearly an hour to deliver, but was nevertheless delivered without notes—this, too, on the 9th of March 1883, when the judge who uttered it was within a fortnight of his death. Never during the 19th century was the business of any court performed so rapidly, punctually, and satisfactorily as it was when Jessel presided. He was Master of the Rolls at a momentous period of legal history. The Judicature Acts, completing the fusion of law and equity, were passed while he was a judge of first instance, and were still new to the courts when he died. His knowledge and power of assimilating knowledge of all subjects, his mastery of every branch of law with which he had to concern himself, as well as of equity, together with his willingness to give effect to the new system, caused it to be said when he died that the success of the Judicature Acts would have been impossible without him. His faults as a judge lay in his disposition to be over-rapid, and to be intolerant of those who, not able to follow the rapidity of his judgment, endeavoured to persist in argument after he had made up his mind; but though he was peremptory with the most eminent counsel, young men had no cause to complain of his treatment of them. His masterfulness in his own court was carried into matters of detail. He

was known to tell a counsel to take his hands out of his pockets while addressing the court, and to say to a law officer of the Crown, who was employing more rhetorical methods than are usual in Chancery courts, "Stop, please, Sir 'Enry; we don't allow eloquence in this division." His inability to aspirate his *h*'s led Serjeant Parry, when a junior remarked on it, to turn fiercely round and say to the critic, "I would rather drop my *h*'s with Jessel than aspirate them with you."

Among other public duties performed by him, Sir George Jessel sat on the Royal Commission for the Amendment of the Medical Acts, taking a keen interest in the subject and an active part in the preparation of the report published by the Commission. He interested himself also actively in the management of London University, of which he was a fellow from 1861, and of which he was elected vice-chancellor in 1880. He was one of the commissioners of patents, and trustee of the British Museum. He was also chairman of the committee of judges which drafted the new rules rendered necessary by the Judicature Acts. He was treasurer of Lincoln's Inn in 1883, and vice-president of the Council of Legal Education. He was also a fellow of the Royal Society. He marks an epoch on the bench, owing to the active part taken by him in rendering the Judicature Acts effective, and also as being the last judge capable of sitting in the House of Commons, a privilege of which he did not avail himself. He was the first Jew who, as Solicitor-General, took a share in the executive government of his country, the first Jew who was sworn a regular member of the Privy Council, and the first Jew who took a seat on the judicial bench of Great Britain; he was also, for many years after being called to the bar, so situated that any one might have driven him from it, because, being a Jew, he was not qualified to be a member of the bar. In person Sir George Jessel was a stoutish, square-built man of middle height, with dark hair, somewhat heavy features, a fresh ruddy complexion, and a large mouth. A bust by W. H. Ingram near the entrance to the Chancery Court of Appeal at the Royal Courts of Justice keeps alive some memory of his personality. Sir George Jessel married in 1856 Amelia, daughter of Joseph Moses, who survived him together with three daughters and two sons, the elder of whom was made a baronet shortly after the death of his distinguished father and in recognition of his services. (E. A. AR.)

Jessore, a town and district of British India, in the presidency division of Bengal. The town is on the Bhairab river, and has a railway station 75 miles north-east of Calcutta. Population (1881), 8495; (1891), 8302. It has a Government high school, with 191 pupils in 1896–97, and four printing-presses, issuing two vernacular periodicals. The district of JESSORE has an area of 2925 square miles. The population in 1881 was 1,939,375; in 1891, 1,888,827; showing a decrease of 3 per cent.; average density, 646 per square mile, or nearly one to every acre in a purely rural tract. Classified according to religion, Hindus numbered 737,601; Mahommedans, 1,150,135; Christians, 840, of whom 64 were Europeans; "others," 251. In 1901 the population was 1,812,770, showing a further decrease of 4 per cent. Land revenue and rates (1897–98), Rs.9,70,834; number of police, 503; number of boys at school (1896–97), 40,063, being 28·4 per cent. of the male population of school-going age; registered death-rate (1897), 33·36 per thousand. Jessore is the centre of sugar manufacture from date palms. There are 120 refineries, employing 1200 hands, with an out-turn valued at Rs.14,82,000. Indigo is a declining industry. There are sixteen concerns and factories, employing 4500 hands, with an out-turn valued at Rs.2,35,000. The district is crossed by the Bengal Central Railway, but the chief means of communication are waterways.

Jever, a town of Germany, grand-duchy of Oldenburg, 13 miles by rail north-west of Wilhelmshaven, and connected with the North Sea by a navigable canal. It boasts of a castle (15th and 16th centuries), a town hall (1609), and an old parish church, with the marble tomb of the Frisian prince, Edo Wiemkens (died 1511), and monuments to the historian Schlosser (1776–1861) and the chemist Mitscherlich (1794–1863), both natives of the place. The fathers (*getreuen*) of the town used to send an annual birthday present of 101 plovers eggs to Prince Bismarck. Population (1895), 5306; (1900), 5486.

Jevons, William Stanley (1835–1882), English economist and logician, was born at Liverpool on 1st September 1835. His father, Thomas Jevons, a man of strong scientific tastes and a writer on legal and economic subjects, was a member of a firm of iron merchants. His mother, Mary Ann Jevons, was the daughter of William Roscoe, the author of the *Life of Lorenzo de' Medici*. At the age of fifteen he was sent to London to attend University College School. He appears at this time, though with habitual reserve he kept his aspirations to himself, to have already formed the belief that important achievements as a thinker were possible to him, and at more than one critical period in his career this belief was the decisive factor in determining his conduct. Towards the end of 1853, after having spent two years at University College, where his favourite subjects were chemistry and botany, he unexpectedly received the offer of the assayership to the new mint in Australia. The idea of leaving England was distasteful, but pecuniary considerations had, in consequence of the failure of his father's firm in 1847, become of vital importance, and he accepted the post. He left England for Sydney in June 1854, and remained there for five years. At the end of that period, though he was earning a satisfactory and increasing income, he came to the conclusion that he "could not any longer sacrifice everything that he really desired and that he thought would prove a really useful way of spending life." He therefore resigned his appointment, and in the autumn of 1859 entered again as a student at University College, London, proceeding in due course to the B.A. and M.A. degrees of the University of London. He now gave his principal attention to the moral sciences, considering that his powers lay mainly in that direction. But his interest in natural science was by no means exhausted: throughout his life he continued to write occasional papers on scientific subjects, and his intimate knowledge of the physical sciences greatly contributed to the success of his principal logical work, *The Principles of Science*. Not long after taking his M.A. degree Jevons obtained a post as tutor at Owens College, Manchester; but the work was arduous and badly paid, and, when added to his literary occupations, it involved a great strain upon his health. In 1866 he was elected professor of logic and mental and moral philosophy and Cobden professor of political economy in Owens College. Next year he married Harriet Ann Taylor, whose father had been the founder and proprietor of the *Manchester Guardian*. Jevons suffered a good deal from ill-health and sleeplessness, and found the delivery of lectures covering so wide a range of subjects very burdensome. He felt it to be an absurdity that one man should have to deal with "the whole sphere of the logical, metaphysical, mental, moral, and economical sciences," and in 1876 he was glad to exchange the Owens professorship for the professorship of political

economy in University College, London, a chair yielding a smaller income, but limited to one subject. Travelling and music, to which he was greatly devoted, were the principal recreations of his life; but his health continued bad, and he suffered from depression. He found his professorial duties increasingly irksome, and feeling that the pressure of literary work left him no spare energy, he decided in 1880 to resign the post. On the 13th of August 1882 he was drowned whilst bathing near Hastings. Throughout his life he had pursued with devotion and industry the ideals with which he had set out, and his journal and letters display a noble simplicity of disposition and an unswerving honesty of purpose. In early manhood he had a great dislike of speaking in public, and lecturing was never his strong point. On giving up his professorship at University College, he wrote: "Sometimes I have enjoyed lecturing, especially on logic, but for years past I have never entered the lecture-room without a feeling probably like that of going to the pillory. I shall never lecture, speechify, or do anything of that sort again if I can possibly help it." He was a prolific writer, and at the time of his death he occupied the foremost position in England both as a logician and as an economist. Professor Marshall has said of his work in economics that it "will probably be found to have more constructive force than any, save that of Ricardo, that has been done during the last hundred years." His literary productiveness continued unabated to the end, and at the time of his death he was engaged upon an economic work that promised to be at least as important as any that he had previously undertaken. It would be difficult to exaggerate the loss which logic and political economy sustained through the accident by which his life was prematurely cut short.

Jevons arrived quite early in his career as a student at the doctrines that constituted his most characteristic and original contributions to economics and logic. The theory of utility, which became the keynote of his general theory of political economy, was practically formulated in a letter written in 1860; and the germ of his logical principle of the Substitution of Similars may be found in the view which he propounded in another letter written in 1861, that "philosophy would be found to consist solely in pointing out the likeness of things." The theory of utility above referred to, namely, that the degree of utility of a commodity is some continuous mathematical function of the quantity of the commodity available, together with the implicated doctrine that economics is essentially a mathematical science, took more definite form in a paper on "A General Mathematical Theory of Political Economy," written for the British Association in 1862. This paper does not appear to have attracted much attention either in 1862 or on its publication four years later in the *Journal of the Statistical Society*; and it was not till 1871, when the treatise on the *Theory of Political Economy* appeared, that Jevons set forth his doctrines in a fully-developed form. It is an interesting fact that it was not till after the publication of this work that Jevons became acquainted with the applications of mathematics to political economy made by earlier writers, notably Cournot and Gossen. It is also noteworthy that the theory of utility was, about 1870, being independently developed on somewhat similar lines by Menger in Austria and Walras in Switzerland. As regards the discovery of the connexion between value in exchange and final (or marginal) utility, the priority belongs to Gossen, but this in no way detracts from the great importance of the service which Jevons rendered to English economics by his fresh discovery of the principle, and by the way in which he ultimately forced it into notice. In his reaction from the prevailing view he sometimes expressed himself without due qualification: the declaration, for instance, made at the commencement of the *Theory of Political Economy*, that "value depends entirely upon utility," lent itself to misinterpretation. But a certain exaggeration of emphasis may be pardoned in a writer seeking to attract the attention of an indifferent public. It was not, however, as a theorist dealing with the fundamental data of economic science, but as a brilliant writer on practical economic questions, that Jevons first received general recognition. His tract on *A Serious Fall in the Value of Gold*, published in 1863, in which he discussed the economic consequences of the gold discoveries of the preceding decade, and his work on *The Coal Question*, published in 1865, in which he demonstrated the dangerous rate of consumption of British coal supplies, placed him in the front rank as a writer on applied economics and statistics; and he would be remembered as one of the leading economists of the 19th century even had his *Theory of Political Economy* never been written. Amongst his economic works, in addition to those already referred to, may be mentioned a short treatise on *Money and the Mechanism of Exchange* (1875), written in a popular style, and descriptive rather than theoretical, but wonderfully fresh and original in treatment and full of suggestiveness, a *Primer on Political Economy* (1878), *The State in Relation to Labour* (1882), and two works published after his death, namely, *Methods of Social Reform* and *Investigations in Currency and Finance*, containing papers that had been written at various times and that had appeared separately in various forms during his lifetime. The last-named volume contains Jevons's interesting speculations on the connexion between commercial crises and sun-spots. As already mentioned, he was engaged at the time of his death upon a large treatise on economics, in which he intended to go over the whole field of the subject.

Jevons's work in logic went on *pari passu* with his work in political economy. In 1863 he speaks of having got his logical system free from further doubt, and in 1864 he published a small volume, entitled *Pure Logic; or the Logic of Quality apart from Quantity*, which was based on Boole's system of logic, but freed from what he considered the false mathematical dress of that system. In the years immediately following he devoted considerable attention to the construction of a logical machine, exhibited before the Royal Society in 1870, by means of which the conclusion derivable from any given set of premisses could be mechanically obtained. In 1866 what he regarded as the great and universal principle of all reasoning dawned upon him; and in 1869 he published a sketch of this fundamental doctrine under the title of *The Substitution of Similars*. He expressed the principle in its simplest form as follows: "Whatever is true of a thing is true of its like," and he worked out in detail its various applications. In the following year appeared the *Elementary Lessons on Logic*, which soon became, and has probably since continued to be, the most widely read elementary text-book on logic in the English language. In the meantime, from 1868 onwards, he was engaged upon a much more important logical treatise, which appeared in 1874 under the title of *The Principles of Science*. In this work Jevons embodied the substance of his earlier works on Pure Logic and the Substitution of Similars; he also enunciated and developed the view that induction is simply an inverse employment of deduction; he treated in a luminous manner the general theory of probability, and the relation between probability and induction; and his knowledge of the various natural sciences enabled him throughout to relieve the abstract character of logical doctrine by concrete scientific illustrations, often worked out

in great detail. Jevons's general theory of induction was a revival of the theory laid down by Whewell and criticized by Mill; but it was put in a new form, and was free from some of the non-essential adjuncts which rendered Whewell's exposition open to attack. The work as a whole must be regarded as one of the most notable contributions to logical doctrine that appeared in Great Britain in the 19th century. Another logical work, entitled *Studies in Deductive Logic*, and consisting mainly of exercises and problems for the use of students, was published in 1880. In 1877 and the following years Jevons contributed to the *Contemporary Review* some articles on J. S. Mill, which he had intended to supplement by further articles, and eventually publish in a volume as a criticism of Mill's philosophy. These articles and one other were republished after Jevons's death, together with his earlier logical treatises, in a volume, entitled *Pure Logic and other Minor Works*. The criticisms on Mill contain much that is ingenious and much that is forcible, but on the whole they cannot be regarded as taking rank with Jevons's other work. His strength lay in his power as an original thinker rather than as a critic; and it will be by his constructive work as a logician, an economist, and a statistician that he will be remembered.

See *Letters and Journal of W. Stanley Jevons*, edited by his wife, 1886. This work contains a bibliography of Jevons's writings.

(J. N. K.)

Jewellery.—The Paris International Exhibition of 1900 was the occasion of a display of goldsmith's work which marked it as an epoch in the history of the craft. If we look back to 1875, we see at once that during the two subsequent decades this industry, though prosperous from the commercial point of view, and always remarkable from that of technical finish, remained stationary as an art. During these twenty years French jewellery rested on its reputation. The traditions were maintained of either the 17th and 18th centuries or the style affected at the close of the Second Empire—light pierced work and design borrowed from natural flowers. The last type, introduced by Massin, had exercised, indeed, a revolutionary influence on the treatment of jewellery. This clever artist, not less skilful as a craftsman, produced a new *genre* by copying the grace and lightness of living blossoms, thus introducing a perfectly fresh element into the limited variety of traditional style, and by the use of filagree gold work altering its character and giving it greater elegance. Massin still held the first rank in the Exhibition of 1878; he had a marked influence on his contemporaries, and his name will be remembered in the history of the goldsmith's art to designate a style and a period. In 1889 the report of this section in the Great Exhibition still records that "flowers and foliage held the first place in jewellery for the hair or bodice." Throughout these years the craft was exclusively devoted to perfection of workmanship. The utmost finish was aimed at in the mounting and setting of gems; jewellery was, in fact, not so much an art as a high-class industry; individual effort and purpose were absent. Still goldsmith's work was an important factor in fashionable jewellery. In 1867, however, the diamond mines discovered in South Africa had begun to supply the markets of Europe with a profusion of these stones. Diamonds were no longer the choice jewels of the privileged few; they were within reach of moderate fortunes. Gold ornaments were cast aside in their favour, and it is, in fact, to this economic development that the modern change of taste in jewellery is mainly due. The constantly growing output of gems led to competition in the production of jewellery, and it became an object to increase the quality and reduce the cost. In the report of the Exhibition of 1889 we are told that mechanical processes have been introduced into the manufacture, hand labour having proved insufficient. Up to that time precious stones had been of such intrinsic value that the jeweller's chief skill lay in displaying these costly stones to the best advantage; the mounting was a secondary consideration. The settings were seldom long preserved in their original condition, but in the case of family jewels were renewed with each generation and each change of fashion, a state of things which could not be favourable to any truly artistic development of taste, since the work was doomed, sooner or later, to destruction. However, the evil led to its own remedy. As soon as diamonds fell in value they lost at the same time the prestige which made them an attribute of wealth. Aristocratic taste now gave a preference to trinkets which derived their value and character from artistic design. This revolutionized the jeweller's craft, and revived the simple ornament of gold or silver, which came forward but timidly at first, till, in the Exhibition of the Salon in 1895, it burst upon the world in the exhibits of René Lalique. This artist at the present day holds a unique position. The Exhibition of 1900 confirmed him in it, not only by the beautiful work he produced, but by the evident influence he exerted during the previous five years over all his rival brethren of the craft. What especially stamps the works of Lalique is their striking originality; his individuality is as plainly expressed in his smallest piece as that of Ingres or of Delacroix in their slightest sketches. He has raised jewellery from ranking as an industry to the dignity of an art. His work may be considered from the point of view of design and from that of execution. As an artist he has completely reconstructed from the foundation the scheme of design which had fed the poverty-stricken imagination of the last generation of goldsmiths. He had recourse to the art of the past, but to the spirit rather than the letter, and to nature for many new elements of design—free double curves, suave or soft; opalescent harmonies of colouring; reminiscences, with quite a new feeling, of Egypt, Chaldæa, Greece, and the East, or of the art of the Renaissance; an infinite variety of floral forms even of the humblest: the dandelion, the thistle, the nasturtium, mistletoe, and honesty, now classical in their artistic application. He introduces also the female nude in the form of sirens and sphinxes, full of tragic force and character. In fact, we find in Lalique a poet who has created an art at once logical and imaginative, full of feeling and of method. As a craftsman he has effected a radical change, breaking through old routine, throwing off old fetters, combining all the processes of the goldsmith, the chaser, the enameller, and the gem-setter, and freeing himself from the narrow lines in which the art had been confined. He ignores the hierarchy of gems, caring no more on occasion for a diamond than for a flint, since, in his view, no stone, whatever its original estimation, has any value beyond the characteristic expression he lends it as a means to his end. Thus, while he sometimes uses diamonds, rubies, sapphires, or emeralds as a background, he will, on the other hand, give a conspicuous position to common stones—carnelian, agate, malachite, jasper, coral, and even materials of no intrinsic value such as horn. One of his favourite stones is the opal, which lends itself to his arrangements of colour, and which has in consequence become a fashionable stone in French jewellery. It is to be feared that after Lalique the rather doubtful tendencies of his art may lead to its decadence by an unintelligent adoption of his theories and bad imitations of his style, for the tendency is to produce important pieces, beautiful by themselves, but too heavy for the person. M. Henri Vever, with whom Lalique formerly worked, has, however, done much to save it by reviving old traditions. What distinguishes M. Vever's

work from that of Lalique (though he has often borrowed from him) is that he has maintained the distinction between gem-setting and goldsmith's jewellery. In the former class of work he, like the earlier jewellers, attaches great importance to the selection of stones; but while returning with judgment to the old ways, he shows much freedom of invention and superior methods of composition and execution. His taste, which is solid and serious, has real distinction, and his exhibit in 1900 contributed to mark the date as memorable in the history of French jewellery. Besides these two artists, there are old-established jewellers (famous for the work of Desbazeille and others) who have maintained their high reputation by adopting the new tendencies, among others Messrs Boucheron, Falize, and Sandoz, noted for admirable workmanship and the good style of their pieces, Messrs Coulon, Chaumet, Marret, Mellerio, Desprès, and others.

The movement which took its rise in France spread in due course to other countries. In England the impulse has come from three different directions. The classic work in gold by the elder Giuliano gave way to a treatment of enamel by the same artist which has scarcely been surpassed for perfection of execution and sobriety of taste in design and colour, while the endless variations, original in themselves, on conventional forms show extraordinary resource and invention. The reputation of the father has, since his death, been sustained by the sons, and in a measure also by imitators. Parallel with the Arts and Crafts movement, designers like C. R. Ashbee, Fred Robinson, and Nelson and Edith Dawson have aimed at purging the jeweller's craft of its character of mere gem-mounting in conventional forms (of which the more unimaginative, representing stars, bows, flowers, and the like, are varied by such absurdities as insects, birds, animals, figures of men, and objects made up simply of stones clustered together). Their work is often excellently and fancifully designed, but it lacks that exquisite perfection of execution achieved by the incomparable craftsmen of France. English sculptor-decorators—such as Alfred Gilbert, R.A., and George J. Frampton, A.R.A.—have produced objects of a still higher class, but it is usually the work of the goldsmith rather than of the jeweller. Examples may be seen in the badge executed by Mr Gilbert for the president of the Institute of Painters in Water Colours, and in the mayoral chain for Preston. Symbolism here enters into the design, which has not only an ornamental but a didactic purpose.

In the United States the neglect of gems for their own sake, which is the chief note of the "New Jewellery" in France, has not yet been so clearly demonstrated. Tiffany, usually regarded in Europe as the leader of American artificers, was seen in the Paris Exhibition of 1900 to have maintained the admirable character of workmanship while developing more and more the richness and magnificence that dazzle rather than charm. Philippe Wolfers occupies in Belgium the position which in France is held by René Lalique. If his design is a little heavier, it is not less beautiful in imagination or less masterly in execution. Graceful, ingenious, fanciful, elegant, fantastic by turns, his objects of jewellery and goldsmithery have a solid claim to be considered *créations d'art*. In Germany the movement is headed by Werner and by Hugo Schäfer of Berlin, and on a lower plane by Stöffler and Zerenner of Pforzheim; but the handling of these distinguished craftsmen is heavier still. J. M. Olbrich and Robert Koch, though not without originality, may be considered as followers of Lalique. In Austria Franz Hauptmann has taken the lead in artistic jewellery. As a representative of Russia, Fabergé of St Petersburg deserves to be mentioned long with Lalique and Wolfers. In Switzerland the development, so far as it is original, seems to have proceeded mainly in the direction of enamelling—not only in "superficial" or painted enamel, but also in *plique à jour* (see ENAMELS), in which Desbazeille of Paris attracted much attention about the year 1890. It must be admitted that many of the best artists who have devoted themselves to jewellery have been more successful in design than in securing lightness such as is required by the wearer, which was a characteristic in the works of the Italian craftsmen of the Renaissance. For this reason many of their masterpieces are more beautiful in the case than upon the person.

(L. BE.; M. H. S.)

Jeypore, or JAIPUR, a native state of India, in the Rajputana Agency. Total area, 15,349 square miles. The population in 1881 was 2,534,357; in 1891, 2,832,276, showing an apparent increase of 12 per cent.; average density, 184 persons per square mile. In 1901 the population was 2,658,075, showing a decrease of 6 per cent., due to the results of famine. The revenue (1896–97) was Rs.67,00,000, of which Rs.8,82,526 was expended on public works; tribute, Rs.4,00,000; number of schools, 772, attended by 25,589 pupils, of whom 261 were girls, the proportion of boys at school being 11 per cent. of those of school-going age. The reigning maharaja, Madho Singh, G.C.S.I., was born in 1861, and succeeded in 1880. He is distinguished for his enlightened administration and his patronage of art. The mint coins gold, silver, and copper, the emblem being a *jhar*, or branch of six sprigs. In 1896–97 the coinage amounted to Rs.13,13,000. Public works are under the charge of a British officer. Since 1868 no less than Rs.47,00,000 has been expended on irrigation. The number of works is 149, irrigating 84,000 *bighas*, and yielding a revenue of Rs.3,00,000. The foundation-stone of a new irrigation project at Ramgarh, estimated to cost Rs.6,13,000 and to irrigate 30,000 *bighas*, was laid in 1897. The state is traversed by the Rajputana Railway, with its two branches to Agra and Delhi. A railway of 73 miles, begun at the expense of the state, is estimated to cost Rs.28,47,000. The state suffered from the famine of 1899–1900. The city of JEYPORE is 84 miles north-east of Ajmir by rail. Population (1881), 142,578; (1891), 158,905, being the seventeenth largest town in India; (1901), 159,550. It is surrounded by a lofty crenelated wall, with seven gates. Unfortunately the architecture is largely pink stucco, in imitation of sandstone. The palace is in the centre, surrounded by pleasure gardens. An excellent water-supply is provided at an annual cost of Rs.60,000. There are a college, with 56 students in 1897–98; a high school, with 584 pupils; a flourishing art school, which owes much of its success to the active interest of Dr Hendley, who has also been for many years in charge of the Mayo Hospital; and an industrial and economic museum.

Jeysulmere, or JAISALMER, a native state of India, in the Rajputana Agency. Area, 16,039 square miles. The population in 1881 was 108,143; in 1891, 115,701; average density, 7 persons per square mile, compared with 94 persons for Rajputana generally. In 1901 the population was 73,436, showing a decrease of 37 per cent., due to the results of famine. The gross revenue (1897–98) was Rs.1,60,000; no tribute. The chief, whose title is maharawal, is the head of the Bhati clan of Rajputs,

who claim a very ancient descent, and have been settled here for more than a thousand years. Their territory once extended to the Indus. The state came under British protection in 1818. The present maharawal, Salivahan, is a minor, born in 1886. The state suffered from famine in 1897, and to a less extent in 1900. There are no railways. Gold, silver, and copper are coined at the mint, to the value of Rs.49,000 in 1897–98. The town of JEYSULMERE is on a ridge of yellowish sandstone, crowned by a fort, which contains the palace. Many of the houses and temples are sculptured with fine carving. Population (1881), 10,965.

Jhabua, a native state of India, in the Bhopawar Agency. It borders on the Panch Mahals district of Bombay. Area, with the dependency of Rutanmal, 1219 square miles. The population in 1881 was 92,938; in 1891, 119,787, showing an apparent increase of 29 per cent.; average density, 99 persons per square mile. About half the inhabitants belong to the aboriginal tribe of Bhils. The revenue (1897–98) was Rs.1,65,215; subsidy to the Malwa Bhil corps, Rs.1470. The chief, whose title is raja, is a Rajput of the Rahtor clan, descended from a branch of the Jodhpur family. The raja, Udai Singh, was in 1901 invested with the powers of administration. The town of JHABUA is on the bank of a lake, and is surrounded by a mud wall. There is an Anglo-vernacular school. A road is under construction to Meghonagar station on the Rajputana Railway. A dispensary and a rest-house were constructed in commemoration of Queen Victoria's Diamond Jubilee in 1897.

Jhalawar, a native state of India, in the Rajputana Agency. Area, 3043 square miles. The population in 1881 was 340,488; in 1891, 343,601, showing an insignificant increase; average density, 113 persons per square mile; gross revenue (1896–97), Rs.16,53,413; tribute, Rs.80,000; expenditure on public works, Rs.1,10,814; military force, 1811 men; boys at school, 964. The late rana, whose relations with the British Government had long been strained, was finally deposed in 1895, "on account of persistent misgovernment and proved unfitness for the powers of a ruling chief." He now lives at Benares, on a pension of Rs.30,000; and the administration was placed in the hands of the British resident. After much consideration, the Government resolved in 1897 to break up the state, restoring the greater part to Kotah, but forming the two districts of Shahabad and the Chaumahla into a new state, of which Kuar Bhawani Singh, a descendant of Zalim Singh, was appointed chief. In 1901 the population of the reduced state was 90,174, on an area of about 1140 square miles. The chief town is Patan, or Jhalra Patan, founded on an old site by Zalim Singh in 1796, by the side of an artificial lake. It is the centre of trade; but the palace is at the cantonment of Chhaoni, 4 miles north. Population of Patan (1881), 11,469; (1891), 10,783. Population of Chhaoni (1881), 20,303; (1891), 23,381.

Jhang, a town and district of British India, in the Lahore division of the Punjab. The town, which forms one municipality with the newer quarter of Maghiana, is about 3 miles from the present right bank of the river Chenab. Population (1881), 21,629; (1891), 23,290; municipal income (1897–98), Rs.44,188. It has manufactures of cotton goods. The district of Jhang extends along both sides of the Chenab, including its confluences with the Jhelum and the Ravi. Area, 5871 square miles. The population in 1881 was 395,296; in 1891, 436,841, showing an increase of 10 per cent.; average density, 74 persons per square mile. In 1901 the population was 378,800, showing an apparent decrease of 13 per cent., due to the creation of the new district of Lyallpur. The land revenue and rates are Rs.10,01,784, the incidence of assessment being five annas per acre; cultivated area (1896–97), 669,342, of which 563,507 were irrigated, including 302,969 from Government canals; number of police, 529; number of schools (1896–97), 204, with 4371 pupils, the proportion of boys at school to male population of school-going age being 10·8 per cent.; registered death-rate (1897), 40·37 per thousand. It has five factories for cleaning and pressing cotton, and one printing-press and one flour-mill, both within the Chenab canal colony, of which the centre is Lyallpur, called after a late lieutenant-governor. This colony, in the north-east of the district, is due to an extension of the Chenab canal system from the adjoining district of Gujranwala. Within Jhang 700,000 acres of Government waste have already been allotted to colonists, who are reported to be flourishing. A branch of the North-Western Railway enters the district in this quarter, and will extend throughout its entire length. There are only 9 miles of metalled road, but 180 miles of navigable river.

Jhansi, a city and district of British India, in the Allahabad division of the North-West Provinces. The city is the centre of the Indian Midland Railway system, whence four lines diverge to Agra, Cawnpore, Allahabad, and Bhopal. Formerly the capital of a Mahratta principality, after the troubles of the Mutiny it was made over to Gwalior, but has been exchanged for other territory. Even when the city was in Gwalior, the civil headquarters and the cantonment were at Jhansi Noabad, under its walls. Population (1891), 53,779; (1901), 55,288; municipal income (1897–98), Rs.47,901; incidence of taxation, Rs.0 : 11 : 6 per head; registered death-rate (1897), 49·68 per thousand. The district of Jhansi forms part of British Bundelkhand. It has been enlarged by the incorporation of the adjoining district of Lalitpur, which extends still farther into the hill country, almost entirely surrounded by native states. The combined area is 3587 square miles. The population in 1881 was 624,953; in 1891, 683,619, showing an increase of nearly 10 per cent.; average density, 191 persons per square mile, ranging from 249 in Jhansi proper to 141 in Lalitpur. In 1901 the population was 611,644, showing a decrease of 11 per cent., due to the results of famine. The land revenue and rates were Rs.6,95,040, the incidence of assessment being six annas per acre; cultivated area (1896–97), 590,635 acres, of which 65,811 were irrigated, including 3934 from Government canals; number of police, 2700; number of vernacular schools (1896–97), 106, with 3192 pupils; death-rate (1897), 47·38 per thousand. There are seven printing-presses, including one owned by the railway company; one factory for pressing cotton. The railway line from Bhopal to Cawnpore runs through the length of the combined district.

Jhelum, or JEHLAM, a town and district of British India, in the Rawalpindi division of the Punjab. The town is on the right bank of the river Jhelam, here crossed by a bridge of the North-Western Railway which for some years had its terminus on the opposite bank, 103 miles north of Lahore. Population (1881), 21,107; (1891), 12,878; municipal income (1897–98), Rs.28,568. It is a modern town, with river and railway trade, boat-building, and cantonments for a cavalry and an infantry regiment. The district of Jhelum stretches from the river Jhelum almost to the Indus, its chief physical feature being the Salt Range. Area, 3995 square miles. The population in 1881 was 589,373; in 1891, 609,056, the rate of increase being 3 per cent; average density, 152 persons per square mile. In 1901 the population was 594,018, showing a decrease of 2 per cent. The land revenue and rates were Rs.7,59,177, the incidence of assessment being Rs.0:4:7 per acre; cultivated area (1896–97), 592,979 acres,

of which 39,879 were irrigated, mostly from private wells, number of police, 496; number of schools (1896–97), 515, with 10,943 pupils, the proportion of boys at school to male population of school-going age being 15 per cent.; registered death-rate (1897), 31·59 per thousand. At the Mayo mine in the Salt Range, salt is annually quarried to the amount of nearly two million maunds, yielding a net revenue of about Rs.50,00,000. There are two coal-mines, the only ones worked in the province, employing nearly 2000 miners, from which the North-Western Railway obtains about 86,000 tons of coal annually. It has one printing-press, issuing two vernacular periodicals. The most populous place and chief centre of the salt trade is Pind Dadan Khan; population (1891), 15,055. The district is crossed by the main line of the North-Western Railway, and also traversed along the south by a branch line, 74 miles. There are no metalled roads, nor any Government canals. The river Jhelam is navigable throughout for 127 miles.

Jhering, Rudolf von (1818–1892), German jurist, was born on the 22nd of August 1818 at Aurich in East Friesland, where his father practised as a lawyer and his family had been resident for several generations. Having received his early education at the gymnasium of his native town, young Jhering entered the University of Heidelberg in 1836 as a student of jurisprudence, and, after the fashion of German students, visited successively Göttingen and Berlin. Of his university career little is known, except that Puchta, the famous civilian and author of *Geschichte des Rechts bei dem römischen Volke*, alone of all his teachers appears to have gained his admiration and influenced the bent of his mind. After graduating *doctor juris*, Jhering established himself in 1844 at Berlin as *privat-docent* for Roman law, and delivered public lectures on the *Geist des römischen Rechts*, the theme which was nearest his heart, and the elaboration of which may be said to have constituted his life's work. In 1845 he accepted a call as ordinary professor to Basel, in 1846 to Rostock, in 1849 to Kiel, and in 1851 to Giessen. Upon all these seats of learning he left his mark; beyond any other of his contemporaries he animated the dry bones of Roman law. The German juristic world was still under the dominating influence of the Savigny cult, and the older school looked askance at the daring of the young professor, who, acting in the spirit of his idea—*Durch das römische Recht über das römische Recht hinaus*—essayed to adapt the old to new exigencies and to build up a system of natural jurisprudence. This is the keynote of his famous work, *Geist des römischen Rechts auf den verschiedenen Stufen seiner Entwickelung* (Leipzig, 1852–65), which for originality of conception and lucidity of scientific reasoning placed its author in the forefront of modern Roman jurists.

The time of Jhering's professional activity at Giessen coincided with the most famous period of that university's history. Liebig had already made its name of world-wide reputation in the field of chemical research, and it now attracted law students from all climes, eager to sit at the feet of the brilliant young professor. It is no exaggeration to say that in the second half of the 19th century the reputation of Jhering occupied as high a position as that of Savigny in the first. Their methods were entirely distinct, nay, almost diametrically opposed. Savigny and his school represented the conservative, historical tendency. In Jhering the philosophical conception of jurisprudence, as a science to be utilized for the further advancement of the moral and social interests of mankind, was predominant. In 1868 Jhering accepted a call to Vienna to the chair of Roman Law, and the fascination he had ever exercised as a teacher did not fail him in his new sphere of activity. His lecture-room was crowded, not only with regular students but with men of all professions and even of the highest ranks in the official world, and he became in the Kaiserstadt one of the lions of society, the Austrian Emperor conferring upon him in 1872 a title of hereditary nobility. But to a mind constituted as his, the social functions of the Austrian metropolis became wearisome, and he gladly exchanged its brilliant circles for the repose of Göttingen, his own Alma Mater, where he became professor in 1872. In this year he had read at Vienna before an admiring audience a lecture, published under the title of *Der Kampf um's Recht* (Vienna, 1872; English ed., *Battle for Right*, London, 1884). Its success was extraordinary. Within two years it attained twelve editions, and it has been translated into twenty-six languages. This was followed a few years later by *Der Zweck im Recht* (2 vols., Leipzig, 1877–83). In these two works is clearly seen Jhering's individuality. The *Kampf um's Recht* shows the firmness of his character, the strength of his sense of justice, and his juristic method and logic: "to assert his rights is the duty that every responsible person owes to himself." In the *Zweck im Recht* is perceived the bent of the author's intellect. But perhaps the happiest combination of all his distinctive characteristics is to be found in his *Jurisprudenz im täglichen Leben* (Jena, 1870). A great feature of his lectures was his so-called *Praktika*, problems in Roman law, and a collection of these with hints for solution was published as early as 1847 under the title *Civilrechtsfälle ohne Entscheidungen*. In Göttingen he continued to live and work until his death, which occurred on the 17th of September 1892. A short time previously he had been the centre of a devoted crowd of friends and former pupils, assembled *en fête* at Wilhelmshöhe near Cassel to celebrate the jubilee of his doctorate. Almost all countries were worthily represented, and this pilgrimage to do honour to the man affords an excellent illustration of the extraordinary fascination and enduring influence that Jhering commanded. His was indeed a delightful personality: he retained until the last the freshness and vigour of youth; he was the light-hearted, joyous German student once more, eloquent, humorous, kindly, with nothing about him of the pedant. What he undertook he grasped with all the powers of his intellect and the fervour of his soul, and what he imparted to his hearers bore testimony to the lucidity of his grasp of the subject. In appearance he was of middle stature, his face clean-shaven and of classical mould, lit up with vivacity and beaming with good nature He was perhaps seen at his best when dispensing hospitality in his own house; and none of his guests would ever forget the sparkle of the wit and geniality of his entertainer. With him died the best beloved and the most talented of Roman-law professors of modern times. It was said of him by Professor Adolf Merkel in an *In Memoriam* address, *R. v. Jhering* (Jena, 1893), that he belonged to the happy class of persons to whom Goethe's lines are applicable: "Was ich in der Jugend gewünscht, das habe ich im Alter die Fülle," and this may justly be said of him, despite the fact that he did not live to finish his life's programme, which would have been to complete his *Geist des römischen Rechts* and his *Rechtsgeschichte*. For this work the span of a single life would have been insufficient, but what he has left to the world is a monument of vigorous intellectual power and stamps Jhering as an original thinker and unrivalled exponent in his peculiar interpretation of the spirit of Roman law.

Among others of his works, all of them characteristic of the author and sparkling with *jeux d'esprit*, may be mentioned the following: *Beiträge zur Lehre von Besitz*, first published in the

Jahrbücher für die Dogmatik des heutigen römischen und deutschen Privat-rechts, and then separately; *Der Besitzwille*, and an article entitled "Besitz" in the *Handwörterbuch der Staatswissenschaften* (1891), which aroused at the time much controversy, particularly on account of the opposition manifested to Savigny's conception of the subject. See also *Scherz und Ernst in der Jurisprudenz* (Leipzig, 1885); *Das Schuldmoment im romischen Privat-recht* (Giessen, 1867); *Das Trinkgeld* (Brunswick, 1882); and among the papers he left behind him his *Vorgeschichte der Indoeuropäer*, a fragment, has been published by v. Ehrenberg (Leipzig, 1894). See for an account of his life also M. de Jonge, *Rudolf v. Jhering* (Berlin, 1888), and *Meyer's Konversations-Lexikon*, 1897; for his relation to Savigny cf. that article in the ninth edition of the *Encyclopædia Britannica*. (P. A. A.)

Jilolo. See HALMAHERA.

Jimena de la Frontera, a town of Spain, in the province of Cadiz. Built on a spur of the mountains, its streets are very irregular and steep. There are two parish churches, and the ruins of a castle on the site of an older Roman structure. The local industries include the manufacture of leather, flour-milling, and the making of esparto-grass rugs. The trade is chiefly in wheat, cork, oranges, wine, and fruit. Population, 7720.

Jind, a native state of India, within the Punjab. It ranks as one of the cis-Sutlej states, which came under British influence in 1809. The territory consists of three or four isolated tracts, amid British districts. Total area, 1268 square miles. The population in 1881 was 249,862; in 1891, 284,560. In 1901 the population was 282,051, showing a decrease of 1 per cent., compared with an increase of 14 per cent. in the previous decade. The average density is 224 persons per square mile. Estimated gross revenue, Rs.6,28,000; military force (including police), 2043 men; no tribute. The chief, whose title is raja, is a Sikh of the Sidhu Jat clan and of the Phulkian family. The dynasty has always been famous for its loyalty to the British, especially during the Mutiny, which has been rewarded with accessions of territory. The present (1902) raja is a minor, under charge of a British tutor, while the state is managed by a council of regency. During the Tirah expedition of 1897–98, the Jind Imperial Service infantry specially distinguished themselves. In 1896–97 the number of schools was 34, attended by 1031 pupils, of whom 9 were girls; the proportion of boys at school was 11 to every 151 of the total male population. There were three Anglo-vernacular schools. The town of JIND is situated in 29° 19′ N. and 76° 23′ E., and is a station on the Southern Punjab Railway, 80 miles north-west of Delhi. Population (1881), 7136.

Jizakh, a district town and fort of Russian Central Asia, province and 64 miles north-east of Samarkand, on the Transcaspian Railway. Population, 16,041.

Joachim, Joseph (1831——), German violinist and composer, was born at Kitsee, near Pressburg, 28th June 1831, the son of Jewish parents. He lived at Pesth from the age of two, and studied there under Serwaczynski, who introduced him at a concert when he was only eight years old. Afterwards he learnt from Hellmesberger and Joseph Böhm in Vienna, the latter instructing him in the management of the bow. In 1843 he went to Leipzig, where the Conservatorium was newly founded; at Mendelssohn's recommendation he received a thorough education in music generally from Ferdinand David and Moritz Hauptmann. In 1844 he came to England, and made his first appearance at Drury Lane Theatre, where his playing of Ernst's fantasia on *Otello* made a great sensation; he also played Beethoven's concerto at a Philharmonic Concert conducted by Mendelssohn. In 1847–49 and 1852 he revisited England, and after the foundation of the Popular Concerts in 1859, up to 1899, he played there regularly in the latter part of the season. On Liszt's invitation, he accepted the post of "Konzertmeister" (*i.e.*, orchestral leader) at Weimar, and was there from 1850 to 1853. From that year he was royal "Konzert-direktor" at Hanover until 1868, when Berlin became his place of residence. He married in 1863 the mezzo-soprano singer, Amalie Weiss (Schneeweiss); she died in 1899. In 1869 Joachim was appointed head of the newly founded "Hochschule für Musik" in Berlin. The famous "Joachim Quartet" was started in the Sing-Akademie in the following year. Besides the consummate manual skill which helped to make him famous in his youth, Joachim was gifted with the power of interpreting the greatest music in absolute perfection: while Bach, Mozart, Beethoven, and Brahms were masters whose works he played with a degree of insight that has never been approached, he was no less supreme in the music of Mendelssohn and Schumann; in short, the whole of the classical repertory has become identified with his playing. His compositions, which have won a high place in the estimation of musicians, are marked by a strong sense of orchestral colouring. His works include two concertos and three other works for violin and orchestra, the best known of which is the famous "Hungarian Concerto," which he has often played in England; six pieces for violin and piano; two works (one a set of "Hebrew Melodies") for viola and piano; several overtures and marches for orchestra, and a "Scena der Marfa" for mezzo-soprano from Schiller's *Demetrius*. No survey of Joachim's career would be complete which omitted mention of his absolute freedom from tricks or mannerism, his dignified bearing, and his unselfish character. His devotion to the highest ideals, combined with a personal massiveness and repose, has brought against Joachim's style an accusation of coldness from admirers of a more effusive temperament. But the answer to this is given by the depth and variety of expression which his mastery of the resources of his instrument put at his command. His biographer, Herr Andreas Moser, summed up all that the world needs to know of one of the most beautiful natures the world has seen in the words, "He plays the violin, not for its own sake, but in the service of an ideal."

Joachimsthal (Czech, *Jáchymov*), chief town of a government district in Bohemia, 10 miles north of Karlsbad. It is a mining centre. In 1890 the population of the commune was 7046, German and Catholic; (1900), 7378. The mines are now nearly exhausted, and but small quantities of silver and uranium are recovered. The State tobacco factory and the manufacture of gloves, uranium, colour-stuffs, lace, and paper are the most important industries.

Jodhpur, or MARWAR, a native state of India, in the Rajputana Agency. Total area (including the dependency of Mallani), 37,445 square miles. The population in 1881 was 1,750,403; in 1891, 2,521,727, showing an apparent increase of 44 per cent.; average density, 67 persons per square mile. In 1901 the population was 1,935,909, showing a decrease of 23 per cent., due to the results of famine. The gross revenue (1897–98) was Rs.58,24,000, of which Rs.20,00,000 was expended on public works; tribute, Rs.2,13,000. The late maharaja, Jaswant Singh, who died in 1896, was a very enlightened ruler. His brother, Pertap Singh, G.C.S.I., a lieutenant-colonel in the British army and LL.D. of Cambridge, visited England on the occasion of Queen Victoria's Diamond Jubilee, and served on the staff of Sir W. Lockhart during the Tirah campaign, being slightly wounded, and also in the campaign in China against the Boxers. He conducted the

administration until his nephew came of age in 1898. The Imperial Service cavalry formed part of the reserve brigade during the Tirah campaign. The state maintains a railway leading to Bikaner. Total length, 320 miles; gross receipts (1897–98), Rs.10,56,000, yielding a profit of 10·50 per cent. on a capital outlay of Rs.64,63,140. A branch railway of 135 miles towards Haidarabad in Sind is now under construction, at an estimated cost of Rs.42,77,000. Gold, silver, and copper money is coined. The state emblems are a *jhar* or sprig of seven branches and a *khanda* or sword. A few years ago the amount coined averaged nearly Rs.4,00,000, but in 1897–98 it was only Rs.7455. Marwar practically escaped the plague, but it suffered more severely than any other part of Rajputana from the famine of 1899–1900. In February 1900 more than 110,000 persons were in receipt of famine relief. The city of JODHPUR is 64 miles by rail north-west of Marwar junction, on the Rajputana Railway. Population (1881), 57,211; (1891), 61,849; (1901), 60,437. The new palace is lighted by electricity. It has many fine buildings, temples, gardens, and tanks. A steam tramway for conservancy purposes, $4\frac{1}{2}$ miles long, has been constructed at a cost of Rs.1,18,000. Mills for grinding flour and crushing grain have been constructed for the Imperial Service troops. The Jaswant College has been affiliated to the B.A. standard of the Allahabad University. To the Hewson Hospital a wing for eye diseases was added in 1898, and the Jaswant Hospital for women is under an English lady M.D.

Johannesburg, a town of British South Africa, the largest place in the Transvaal, and in the whole of Africa south of Cairo. It had an estimated population of from 120,000 to 130,000 before the exodus which took place previous to the outbreak of hostilities in 1899. Yet it is quite a recent foundation, which owes its existence to the discovery of the rich Witwatersrand goldfields about 1885. It stands 5500 feet above the sea, on the southern slope of the Rand, near the sources of the Natal Spruit, flowing southwards to the Vaal, and of the Jokeskei, going northwards to the Limpopo. It lies 26 miles south by west of Pretoria, with which it is connected by a circuitous railway connecting at Elandsfontein station with the main Transvaal system. The town has been described as a strange intermingling of squalor and luxury, of dirt outside and cleanliness within, of native hovels, wretched stores and shanties jostling shops and warehouses that would not be out of place in London or New York. It is traversed by one or two spacious thoroughfares, such as Commissioner and Pritchard Streets, which are flanked by some stately public buildings, palatial business offices, and private residences, and commanded by a formidable-looking fort erected by the Boer Government to overawe the Uitlanders, but now dismantled. According to the 1896 census, the motley population included 43,000 natives, nearly 1000 Malays, 4800 Chinese, and 51,000 whites, of whom 34,000 were British, 8000 Boers, 5500 Russians and Germans, 800 Hollanders, 600 Americans, and 1600 French, Italians, and other Europeans. But many of these foreigners disappeared after the occupation by the British forces under Lord Roberts on 29th May 1900. In the neighbouring village of KRUGERSDORP stands the national monument erected on the open veldt to commemorate the Boer victory over the Zulu king, Dingaan, in 1838, and the declaration of independence in 1880.

(A. H. K.)

Johns Hopkins University.—The Johns Hopkins University was incorporated in 1867, at Baltimore, Maryland, and formally inaugurated in 1876, after the founder's death. The founder, Johns Hopkins, divided the major part of his fortune between the university and a hospital, giving each about $3,500,000. The first president, Daniel Coit Gilman, served from 1875 to 1901, when he was succeeded by Ira Remsen. The university includes: (1) a graduate school, which confers the degree of Ph.D. after at least three years' residence; (2) a medical school, closely affiliated with the Johns Hopkins Hospital and planned for the instruction of those who have already received a degree in the liberal arts; and (3) a college, in which any one of seven parallel four-year courses leads to the degree of B.A. In 1901 the teaching staff numbered 143, and the students 650. Of the university graduates of the institution, over one-third influence the trend of higher education in America, about 350 holding professorships and instructorships in colleges and universities throughout the land, and 70 teaching in higher-grade schools. The chief characteristics of the university are a gradual growth from a firm basis, no needless duplication of the work of other institutions, freedom in methods of teaching, the liberal encouragement of research, the training of collegiate graduates through the stimulus of original investigation, and medical education on advanced scientific lines. It supports in whole or in part the following serial publications, some of them past their twentieth volume: *The American Journal of Mathematics, The American Chemical Journal, The American Journal of Philology, Studies in Historical and Political Science, Memoirs from the Biological Laboratory, The University Circulars, Contributions to Assyriology, Modern Language Notes, The Journal of Experimental Medicine,* and *Terrestrial Magnetism.* Over three hundred doctors' dissertations have likewise been printed, besides many works by members of the academic staff. The library contains 103,000 volumes. Since its founding the university has received gifts amounting to considerably more than $1,000,000. (See also BALTIMORE, EDUCATION, MEDICAL EDUCATION, and UNIVERSITIES.)

Johnston, Joseph Eggleston (1807–1891), American general in the Confederate army, was born at Cherry Grove, Rockingham county, Virginia, on 3rd February 1807. His father was Judge Peter Johnston, a Virginian of Scottish descent, who in boyhood served in the War of the Revolution, and afterwards became a distinguished jurist; his mother was Mary Wood, a niece of Patrick Henry. He graduated at the U.S. Military Academy at West Point, in the same class with Robert E. Lee, and was promoted to brevet second lieutenant, 4th Artillery, in 1829. He served with distinction until 1837, when he was engaged as a civil engineer, but a year afterwards he was reappointed in the army as first lieutenant of the corps of Topographical Engineers. During the Mexican war he served in that capacity, and later as lieutenant-colonel of a regiment of voltigeurs. He was twice severely wounded in a reconnaissance at Cerro Gordo, 1847. He was engaged in the siege of Vera Cruz, the battles of Contreras, Cherubosco, Molino del Rey, the storming of Chapultepec, and the assault on the city of Mexico, and received three brevets for gallant and meritorious service. In 1860 he was commissioned quartermaster-general. On 22nd April 1861 he resigned from the U.S. army and entered the Confederate service. He was commissioned major-general of volunteers in the army of Virginia, and assisted General Lee in organizing the volunteers. He was later appointed a general officer of the Confederacy, and assigned to the command of the army of the Shenandoah, being opposed by the Federal army under General Patterson. When General M'Dowell advanced upon the Confederate forces under Beauregard at Manassas, Johnston moved with great rapidity to the latter's assistance, and

being senior officer, took command on the field, and won the decisive victory of Manassas or Bull Run for the Confederate arms. On 31st August 1861 he was made one of the five full generals of the Confederacy, and remained in command of the forces in Virginia designated as the army of the Potomac. He commanded in the battle of Seven Pines (31st May 1862), and was so severely wounded as to be incapacitated for duty for several months. On 24th March 1863 he was assigned to the command of the south-west, including the forces of Generals Bragg, Kirby, Smith, and Pemberton, and in May was ordered to take immediate command of all the Confederate forces in Mississippi, then threatened by Grant, who was approaching to attack Vicksburg. When Pemberton's army was besieged in the city of Vicksburg by Grant, Johnston used every effort possible to relieve it, but his force was inadequate. On 18th December 1863 he was transferred to the command of the army of Tennessee, with headquarters at Dalton, Georgia. In February he successfully resisted the advance of the Federal army under General Thomas. On 3rd May 1864 Sherman commenced his advance upon Johnston's army at Dalton. In the remarkable campaign that followed, both armies were reinforced; a conservative estimate places Sherman's average of effective forces throughout at about 100,000 men, and Johnston's at less than half that number. From 9th May to 17th July Johnston fought Sherman almost daily, his line of battle constantly confronting and engaging Sherman's largely preponderating forces, the principal engagements being Tunnel Hill, Rocky Face Ridge, Buzzard Roost, Dug Gap, Mill Creek Gap, Snake Creek, and Varnells, from May 3rd to 12th; Dalton and Resaca, May 13th and 14th; Adairsville, May 17th; Cassville and Kingston, May 18th to 24th; Dallas and New Hope, May 25th, 26th; Pickett's Mill, May 27th; Kenesaw Mountain, including Pine Knob, Kulp's, M'Afee's, Golgotha, Latimer, and Powder Springs, June 9th to 30th; engagements on the Chattahoochie and in front of Atlanta, June 30th to July 17th. Sherman's plans seem to have been to press his large and well-equipped army upon the small force under Johnston and compel him to retreat, but the retrograde movement on the part of Johnston was conducted with such skill that Sherman's advance hardly exceeded an average of a mile a day. Johnston's losses were 10,672. Sherman's losses are given by him approximately at 3700 killed, 19,548 wounded, and 3800 missing. On 17th July Johnston was succeeded in command by General Hood, and on 23rd February 1865 he was ordered by Lee to assume control of the army of Tennessee and all the troops in South Carolina, Georgia, and Florida. Concentrating all available troops, which numbered about 16,000, Johnston threw himself in front of Sherman's army of 60,000, and attacking the head of his column at Bentonville, North Carolina, captured four pieces of artillery and 900 prisoners. He then retired to Raleigh, and later to Greensboro. After Lee surrendered the army of Northern Virginia to Grant, Johnston advised Mr Davis that it was in his opinion wrong and useless to continue the conflict, and he was authorized to make terms with Sherman. The terms entered into between these generals, 18th April, having been rejected by the United States Government, another agreement was signed 26th April, similar in terms to the surrender of Lee. After the close of the war Johnston engaged in civil pursuits, and occupied business positions of importance. In 1874 he published a *Narrative of Military Operations during the Civil War*. In 1877 he was elected to represent the Richmond district of Virginia in Congress. In 1887 he was appointed by President Cleveland U.S. Commissioner of Railroads. Johnston was married in early life to Louisa, daughter of Louis M'Lane; she died in 1886. He died at Washington, D.C., on 21st March 1891, leaving no children. (J. WH.)

Johnstone, a police burgh and manufacturing town of Renfrewshire, Scotland, on the Black Cart river, about 10 miles west by south of Glasgow by rail. The industrial establishments include a large shoe-lace factory. Recent erections are an Established church, municipal buildings, a cottage hospital, and a drill hall; there are also a town hall, and a combination hospital for infectious diseases. The gasworks have been acquired by the town. Population (1881), 9268; (1901), 10,502.

Johnstown, capital of Fulton county, New York, U.S.A., on the Fonda, Johnstown, and Gloversville Railroad, at an altitude of 659 feet. It has a regular plan, and a good water-supply and sewerage system. It is largely engaged in the manufacture of gloves. Population (1880), 5013; (1900), 10,130, of whom 1653 were foreign-born and 108 negroes.

Johnstown, capital of Cambria county, Pennsylvania, U.S.A., on the Conemaugh river and on the Pennsylvania and the Baltimore and Ohio railways, at an altitude of 1170 feet. Its site is the narrow gorge of the river, along which its buildings are arranged irregularly for a considerable distance. It has iron manufactures, and contains furnaces, rolling-mills, and foundries, being the headquarters of the Cambria Steel Works. Its manufactures had in 1900 a capital of $16,940,450, employed 6116 hands, and the product was valued at $22,559,890, nearly all of which consisted of iron and steel. In 1889 a dam on the Little Conemaugh, nine miles above Johnstown, burst, and the flood swept away nearly the entire town and caused the loss of thousands of lives and the destruction of millions of dollars' worth of property. The town was, however, quickly rebuilt, and has since grown with great rapidity. In 1900 the assessed valuation of real and personal property, on a basis of about two-thirds of the full value, was $13,851,987; the net debt was only $373,785, and its rate of taxation was $15·70 per $1000. Population (1880), 8380; (1890), 21,805; (1900), 35,936, of whom 7318 were foreign-born and 314 negroes.

Johor (not JOHORE), an independent Malayan state at the southern end of the peninsula, stretching from 2·40° S. to Cape Romania (Ramûnya), the most southerly point on the mainland of Asia, and including all the small islands adjacent to the coast which lie to the south of parallel 2·40° S. It is bounded on the N. by the protected native state of Pahang; on the N.W. by the Nĕgri Sĕmbîlan and the territory of Malacca; on the S. by the strait which divides Singapore island from the mainland; on the E. by the China Sea; and on the W. by the straits of Malacca. The province of Mûar was placed under the administration of Johor by the British Government as a temporary measure in 1877, and has continued to be a portion of the sultan's dominions since that date. The coast-line, which is the boundary of the state on three sides, measures about 250 miles in length. Greatest length from north-west to south-east, 165 miles; greatest breadth from east to west, 100 miles. The area is estimated at about 9000 square miles. The principal rivers are the Mûar, which is the most important waterway in the south of the peninsula; the Johor, up which river the old capital of the state was situated; the Endau, which marks the boundary with Pahang; and the Bâtu Pâhat and Sĕdĕli, which, however, are of comparative unimportance. Johor is less mountainous than any other state in the peninsula. The highest peak is Gûnong Lêdang, called Mount Ophir by Europeans, which measures some 4000 feet in height.

Like the rest of the peninsula, Johor is covered from end to end by one vast spread of forest, only broken here and there by clearings and settlements of insignificant area. The capital is Johor Bharu, situated at the nearest point on the mainland to the island of Singapore. The late sultan built a fine palace at this place, which is the principal feature of the town. The inhabitants number about 20,000. It is chiefly attractive as a kind of Oriental Monte Carlo, and is much resorted to from Singapore, to which place it is joined by a road 14 miles in length. There is a good service of coaches. The capital of the province of Mûar is Bandar Maharani, named after the wife of the late sultan before he had assumed his final title. It is not a very important place. The climate of Johor is healthy and equable for a country situated so near to the equator; it is cooler than that of Singapore. No exact figures can be obtained as to the population of Johor, but the best estimates place it at about 200,000, of whom 150,000 are Chinese, 35,000 Malays, 15,000 Javanese. We are thus presented with the curious spectacle of a country under Malay rule in which the Chinese outnumber the people of the land by more than four to one. It is not possible to obtain any exact data on the subject of the revenue and expenditure of the state. The revenue, however, is probably about three-quarters of a million of dollars, and the expenditure upon public service is comparatively small. The revenue is chiefly derived from the revenue farms for opium, spirits, gambling, &c., and from duty on pepper and gambier exported by the Chinese. The cultivation of these products forms the principal industry. There is little known mineral wealth.

History.—It is claimed, in common with many of the other states of the peninsula, that the Mahommedan empire of Johor was founded by the sultan of Malacca after his expulsion from his kingdom by the Portuguese in 1511. It is certain that Johor took an active part, only second to that of Achin, in the war which was so long protracted between the Portuguese and the Dutch for the possession of Malacca. Later we find Johor ruled by an officer of the sultan of Rîau, bearing the title of Tumĕnggong, and owing feudal allegiance to his master in common with the Bĕndăhâra of Pahang. In 1812, however, this officer seems to have thrown off the control of Rîau, and to have assumed the title of sultan, for one of his descendants, sultan Husain, ceded the island of Singapore to the East India Company in 1819. In 1855 the then sultan, Ali, was deposed, and his principal chief, the Tumĕnggong, was given the supreme rule by the British. His son Tumĕnggong Abubakar proved to be a man of exceptional intelligence. He made numerous visits to Europe, took considerable interest in the government and development of his country, and was given by Queen Victoria the title of maharaja in 1879. In 1885 he entered into a new agreement with the British Government, and was allowed to assume the title of sultan of the state and territory of Johor. He was succeeded in 1895 by his son sultan Ibrahîm. The government of Johor has been so comparatively free from abuses under its native rulers that it has never been found necessary to place it under the residential system in force in the other native states of the peninsula which are under British control, and on several occasions the late sultan used his influence with good effect on the side of law and order. Mûar was placed under the rule of Johor in 1877.

The close proximity of Johor to Singapore has caused the rulers of the former state to be constantly subjected to the influence of European public opinion, and this has served to bring about the abolition of most of the abuses which are wont to disfigure native rule in a Malayan state. None the less, the Malay is by nature but ill fitted for the drudgery which is necessary if proper attention is to be paid to the dull details whereby government is rendered good and efficient. In sultan Abubakar Johor possessed a man of quite exceptional force of character and intellect, and his principal adviser, the Dâto' Mĕntri, was a worthy servant of his master. Now, however, the reins of government are mostly in the hands of a set of young men who lack either experience or the serious devotion to dull duties which is the distinguishing mark of the English civil servants whose system is mimicked in Johor. The result is that the country is not well ruled, and that the finances are sadly mismanaged. Mûar, in imitation of the British system, is ruled by a raja of the house of Johor, who bears the title of Resident. He has travelled a good deal in other countries. A legal interest attached to one incident connected with his residence abroad. He was made the defendant in a suit for breach of promise of marriage in the English law courts, but the plaintiff was non-suited, since it was decided that no action lay against a foreign sovereign. (H. CL.)

Joinville, François Ferdinand Philippe Louis Marie, Prince de (1818–1900), the third son of Louis Philippe, duc d'Orleans, afterwards king of the French, was born at Neuilly, 14th August 1818. He was educated for the navy, and after passing regularly through every grade of instruction, became lieutenant in 1836. His first conspicuous service was at the bombardment of San Juan de Ulloa, in November 1838, when he headed a landing party and took the Mexican general Arista prisoner with his own hand. He was promoted to be captain, and was in 1840 entrusted with the charge of bringing the remains of Napoleon from St Helena to France. The question of Mehemet Ali caused at the time apprehensions of a war with Great Britain, and the prince made some political capital with his countrymen and excited some ridicule abroad by needless declarations of his intentions in case of his vessel being attacked. In 1845 he conducted naval operations on the coast of Morocco, bombarding Tangier and occupying Mogador, and was recompensed by the grade of vice-admiral. In the following year he published an article on the deficiencies of the French navy which attracted considerable attention, and studied in every way to acquire popularity, especially by an affectation of ill-will towards Great Britain. The Revolution of 1848 nevertheless swept him away with the other Orleans princes. He hastened to quit Algeria, where he was then serving, and took refuge at Claremont, in Surrey, with the rest of his family. In 1861, upon the breaking out of the American Civil War, he proceeded to Washington, and placed the services of his son and two of his nephews at the disposal of the United States Government. Otherwise, he was little heard of until the overthrow of the Empire in 1870, when he re-entered France, only to be promptly expelled by the Government of National Defence. Returning incognito, he joined the army of General d'Aurelle de Paladines, under the assumed name of Colonel Lutherod, fought bravely before Orleans, and afterwards, divulging his identity, formally sought permission to serve. Gambetta, however, arrested him and sent him back to England. In the National Assembly, elected in February, the prince was returned by two departments and elected to sit for the Haute Marne, but, by an arrangement with Thiers, did not take his seat until the latter had been chosen President of the provincial republic. His deafness prevented him from making any figure in the Assembly, and he resigned his seat in 1876. In 1886 the provisions of the law against pretenders to the throne deprived him of his rank as vice-admiral, but he continued to live in France,

and died at Paris, 16th June 1900. He had married in 1843 the Princess Francisca, sister of Pedro II., emperor of Brazil, and had a son, the duc de Penthièvre, also brought up to the navy. The prince de Joinville was the author of several essays and pamphlets, on naval affairs and other matters of public interest, including a criticism on the Potomac campaign of 1862, which were collected and republished after the overthrow of the Second Empire. (R. G.)

Jókai, Maurus (1825——), the greatest Hungarian novelist of the 19th century, was born at Rév-Komárom on 19th February 1825. His father, Joseph, was a member of the Asva branch of the ancient Jókay family; his mother was a scion of the noble Pulays. The lad was timid and delicate, and therefore educated at home till his tenth year, when he was sent to Pressburg, subsequently completing his education at the Calvinist college at Pápá, where he first met Petöfi, Alexander Kozma, and several other brilliant young men who subsequently became famous. His family had meant him to follow the law, his father's profession, and accordingly the youth, always singularly assiduous, plodded conscientiously through the usual curriculum at Kecskemet and Pest, and as a full-blown advocate actually succeeded in winning his first case. But the drudgery of a lawyer's office was uncongenial to the ardently poetical youth, and, encouraged by the encomiums pronounced by the Hungarian Academy upon his first play, *Zsidó fiu* ("The Jew Boy"), he flitted, when barely twenty, to Pest in 1845 with a MS. romance in his pocket; he was introduced by Petöfi to the literary notabilities of the Hungarian capital, and the same year his first notable romance, *Hétköznapok* ("Working Days"), appeared, first in the columns of the *Pesti Dievatlap*, and subsequently, in 1846, in book form. *Hétköznapok*, despite its manifest crudities and extravagances, was instantly recognized by all the leading critics as a work of original genius, and in the following year Jókai was appointed the editor of *Életképek*, the leading Hungarian literary journal, and gathered round him all the rising talent of the country. On the outbreak of the revolution of 1848 the young editor enthusiastically adopted the national cause, and served it with both pen and sword. Now, as ever, he was a moderate Liberal, setting his face steadily against all excesses; but, carried away by the Hungarian triumphs of April and May 1849, he supported Kossuth's fatal blunder of deposing the Hapsburg dynasty, and though, after the war was over, his life was saved by an ingenious strategem of his wife, the great tragic actress, Roza Benke Laborfalvi, whom he had married on 29th August 1848, he lived for the next fourteen years the life of a political suspect. Yet this was perhaps the most glorious period of his existence, for during it he devoted himself to the rehabilitation of the proscribed and humiliated Magyar language, composing no fewer than thirty great romances, besides innumerable volumes of tales, essays, criticisms, and facetiæ. This was the period of such masterpieces as *Erdély Arany Kord* ("The Golden Age of Transylvania"), with its sequel *Törökvilág Magyarországon* ("The Turks in Hungary"), *Egy Magyar Nábob* ("A Hungarian Nabob"), *Karpáthy Zoltán*, *Janicsárok végnapjai* ("The Last Days of the Janissaries"), *Szomorú napok* ("Sad Days"). On the re-establishment of the Hungarian constitution by the Composition of 1867, Jókai took an active part in politics. As a constant supporter of the Tisza Administration, not only in parliament, where he sat continuously for more than twenty years, but also as the editor of the Government organ, *Hon*, founded by him in 1863, he became a power in the state, and, though he never took office himself, frequently extricated the Government from difficult places. As a suave, practical, and witty debater he was particularly successful. Yet it was to literature that he continued to devote most of his time, and his productiveness after 1870 was stupendous, amounting to many hundreds of volumes. Stranger still, none of this work is slipshod, and the best of it deserves to endure. Amongst the finest of his later works may be mentioned the unique and incomparable *Az arany ember* ("A Man of Gold")—translated into English under the title of "Timar's Two Worlds"—and *A tengerzemü hölgy* ("The Lady with Eyes like the Sea"), which won the Academy's prize in 1890. Jókai is an arch-romantic, with a perfervid Oriental imagination, and humour of the purest, rarest description. If one can imagine a combination, in almost equal parts, of Walter Scott, William Beckford, Dumas *père*, and Charles Dickens, plus a semi-savage Magyar *je ne sais quoi*, one may perhaps form a fair idea of the great Hungarian romancer's indisputable genius.

See Névy László, *Jókai Mór*.—Hegedúsis Sándor, *Jókai Mórról*.

Jokjokarta (Dutch, *Djokdjakarta*), a residency of middle Java, on the south coast, forming with Surakarta, another residency, the *Vorstenlanden* (territories of the princes). Its area is about 1200 square miles. The country is very mountainous, only the southern part between the rivers Progo and Opak being low and flat. In the north-west are the southern slopes of the Merapi (9400 feet), and in the east the hills and plateau of Kidul and Sevu, known as the Thousand Hills. The rivers fertilize the soil, but are not navigable. In their immediate vicinity are thirty-nine indigo and sixteen sugar factories, but east and west of the streams only two or three factories are found. Coal and marble occur in Kidul and Sevu. Notwithstanding the natural resources, the natives are poor, owing chiefly to the maladministration of the princes and their functionaries, the use of opium, and the usury practised by foreigners (Chinese, Arabs, &c.). The population in 1897 numbered 858,392 (for details see Java). The principality is divided into the territory of the sultan (vassal of the Dutch Government), that of the so-called independent prince Paku Alam, and two enclaves of Surakarta, Ngawen and Imogiri. There are good roads, and railways connect the chief town with Batavia, Samarang, Surakarta, &c. Jokjokarta, the chief town, is situated at an altitude of about 300 feet at the foot (S.S.E.) of Merapi. It is connected with Batavia by a tramway 420 kilometres in length. It is the seat of the prince, the resident, and Paku Alam, and comprises separate kampongs for Europeans, Chinese, and other foreigners. It is governed by Dutch functionaries, not by the sultan. The most remarkable section of the town is the Kraton (or citadel), containing palaces and kampongs with about 15,000 inhabitants. The total population of the town is 60,523 (Europeans 2240, natives 54,219, Chinese 3836).

Veth, *Java*, iii. p. 618; Rogge, "De kraton van Djokja," *Volksalmanak van 't nut v. het Algem*, 1873, p. 49.

Joliet, capital of Will county, Illinois, U.S.A., on the Des Plaines river and at the intersection of five railways, at an altitude of 538 feet. It has a level site in the bottom-land, and a regular plan, divided into seven wards. It has a good system of water-supply, owned by the city, is sewered, and its business streets are paved. It contains one of the state prisons. It is an important railway centre, with a large trade, and it has, moreover, extensive and varied manufactures. In 1890 there was a manufacturing capital of $9,418,932, employing 3183 hands and producing goods valued at $12,732,933. The

assessed valuation of real and personal property in 1898 was $2,861,152, and the net debt was $239,937. Population (1890), 23,264; (1900), 29,353, of whom 8536 were foreign-born and 650 negroes.

Joncières, Victorin (1839——), French composer, was born in Paris, 12th April 1839. He first devoted his attention to painting, but afterwards took up the serious study of music. He entered the Paris Conservatoire, but did not remain there long, because he had espoused too warmly the cause of Wagner against his professor. He has composed the following operas: *Sardanapale* (Théâtre Lyrique, 1867), *Le Dernier Jour de Pompéi* (Théâtre Lyrique, 1869), *Dimitri* (Théâtre Lyrique, 1876), *La Reine Berthe* (Opéra, 1878), *Le Chevalier Jean* (Opéra Comique, 1885), *Lancelot* (Opéra, 1900). He has also written incidental music to *Hamlet*, a symphony, and other works. M. Joncières' admiration for Wagner asserts itself rather in a musical than a dramatic sense. The influence of the German master's earlier style can be traced in operas. M. Joncières has, however, adhered to the recognized forms of the French opera and has not modelled his works according to the later developments of the Wagnerian "music drama." He may indeed be said to have been at least as much influenced by Gounod as by Wagner. M. Joncières, like so many other French composers, is also a writer of musical criticism, and from 1871 acted in this capacity for *La Liberté*.

Jones, Henry (1831–1899), English author, well known as a writer on whist under his *nom-de-guerre* "Cavendish," was born in London on the 2nd of November 1831, being the eldest son of Henry D. Jones, a medical practitioner. He adopted his father's profession, and after being admitted M.R.C.S. and a member of the Society of Apothecaries in 1852, established himself and continued for sixteen years in practice in London. The father was a keen devotee of whist, and under his eye the son became early in life a good player. He was a member of several whist clubs, among them the "Cavendish," and in 1862 appeared his *Principles of Whist, stated and explained by Cavendish*, which was destined to become the leading authority when disputes had to be settled as to the practice of the game. This work was followed by treatises on the laws of piquet and écarté. "Cavendish" also wrote on billiards, lawn tennis, and croquet, and was a contributor of articles on whist and other games to the ninth edition of the *Encyclopædia Britannica*. *The Times*, in a leading article, 17th February 1899, said of him: "'Cavendish' was not a law-maker, but he codified and commented upon the laws which had been made, no one knows by whom, during many generations of card-playing," and stated that one of the most noteworthy points in "Cavendish's" character was the manner in which he kept himself abreast of improvements in his favourite game. He died on the 10th of February 1899.

Jönköping, one of the principal industrial towns of Sweden, standing at the south extremity of Lake Wetter, 114 miles by rail east of Gothenburg. Its chief industries are the manufacture of matches (since about 1860), and paper and paper roofing; and at Husqvarna, (5 miles to the east) are the principal Swedish factories for firearms, as well as sewing machines, and foundries. Jönköping is the original home of the well-known *säkerhetständstickor* (safety matches). Eight miles to the south is Mount Taberg, a solid mass (394 feet high, 2950 feet long, 1475 feet broad) of magnetic iron ore, which, however, owing to the low percentage (32 per cent.) of iron and the difficulty of smelting it, is but little worked. Population (1880), 16,147; (1900), 23,143.

Joplin, a city of Jasper county, Missouri, U.S.A., at an altitude of 979 feet. It has a level site and a regular plan. It is entered by four railways, the Kansas City, Fort Scott and Memphis, the Missouri Pacific, the Port Arthur route, and the St Louis and San Francisco. It is the centre of the lead and zinc region of south-western Missouri and south-eastern Kansas, and it contains smelting and other works for reducing ores and making by-products. Population (1880), 7038; (1900), 26,023, of whom 893 were foreign-born and 773 negroes.

Joppa, Yáfá, or Jaffa, chief town of a kaza of the Jerusalem sanjak, situated on the sea-coast, and built, for the most part, on a rounded hill about 110 feet high. It is the port of Jerusalem, with which it is connected by a metre-gauge railway and a carriage road; but steamers have to lie in an open roadstead, about half a mile from the shore, and in stormy weather landing is impossible. In the old town the houses rise in terraces from the water's edge, and the streets are narrow and dirty; but beyond its limits, where the fortifications have been rased, new quarters, with well-built houses and broad streets, have sprung up. The celebrated orange gardens now cover an area of four square miles, and more ground is constantly being brought under cultivation. The principal exports (£264,950 in 1900) are soap from Náblus, oranges, sesame, water-melons, and wine; and the imports (£382,405 in 1900) are cotton goods, timber, tiles, and petroleum. The average annual value of the trade during the previous five years was exports £317,736, imports £310,260. The increase of the import trade is due to the opening of the railway to Jerusalem. The population is about 35,000 (Moslems 23,000, Christians 5000, Jews 7000). The German "Temple" colony, founded in 1868, numbers about 320 souls. The number of pilgrims passing through Jaffa to Jerusalem in 1900 was 14,500, and the number of tourists 3000. The town contains British, French, and German hospitals and schools for boys and girls; and Russian and Latin monasteries and hospices. On its outskirts there is an excellent agricultural school for Jews, with a large model farm, established by the Alliance Israélite. (C. W. W.)

Jordan (Arabic, *esh-Sherí'a*, "the watering-place"), the principal river of Palestine and one of the most remarkable rivers in the world. It flows from north to south in a deep trough-like valley, the Ghór, which follows the line of a fault, or fracture of the earth's crust, and for more than two-thirds of its course it lies below the level of the sea. It has never been navigable, no important town has ever been built on its banks, and it runs into a sea which has no port and which is destitute of animal life. From its sources to the Dead Sea it rushes down a continuous inclined plane, broken here and there by rapids and small falls; and between the Sea of Galilee and the Dead Sea its sinuosity is so great that in a direct distance of sixty-five miles it traverses at least 200 miles. The river actually flows in a depression, the Zór, from a quarter to two miles wide, which it has hollowed out for itself in the bed of the Ghór. During the rainy season (January and February), when Jordan overflows its banks, the Zór is flooded, but when the water falls it produces rich crops. The floor of the Ghór falls gently to the Zór, and is intersected by deep channels, which have been cut by the small streams and winter torrents that traverse it on their way to the Jordan. As far south as Kurn Surtabeh most of the valley is fertile, and even between that point and the Dead Sea there are several well-watered oases. In summer the heat in the Ghór is intense, 110° F. in the shade, but in winter the temperature falls to 40°, and sometimes to 32°, at night. During the seasons of rain and melting

snow the river is very full, and liable to freshets. After twelve hours' rain it has been known to rise from four to five feet, and to fall as rapidly. In 1257 the Jordan was dammed up for several hours by a landslip, probably due to heavy rain, near the spot at which the stoppage took place when the Israelites crossed opposite Jericho. On leaving the Sea of Galilee the water is quite clear, but it soon assumes a tawny colour from the soft marl which it washes away from its banks and deposits in the Dead Sea. The Jordan is crossed by two stone bridges—one north of Lake Huleh, the other between that lake and the Sea of Galilee—and by a wooden bridge on the road from Jerusalem to Gilead and Moab. During the Roman period, and almost to the end of the Arab supremacy, there were bridges on all the great lines of communication between eastern and western Palestine, and ferries at other places. The depth of water varies greatly with the season. When not in flood the river is easily fordable, and between the Sea of Galilee and the Dead Sea there are then more than fifty fords—some of them of historic interest. The natural products of the Jordan valley—a tropical oasis sunk in the temperate zone, and overhung by Alpine Hermon—are unique. Papyrus grows in Lake Huleh, and rice and cereals thrive on its shores, whilst below the Sea of Galilee the vegetation is almost tropical. The flora and fauna present a large infusion of Ethiopian types; and the fish, with which the river is abundantly stocked, have a great affinity with those of the rivers and lakes of East Africa.

Josefstadt (formerly known as PLESS), a town in the government district of Königinhof, north-east Bohemia, Austria, at the confluence of the Aupa and Mettau with the Elbe. It was fortified up to 1888, and is the headquarters of a military district and an artillery depot, with a garrison of 3630 men. Although situated in a small German-speaking enclave, more than half the inhabitants (6116 in 1900) are Czech.

Jóshekán, a small province of Persia covering about 1000 square miles. It has a yearly revenue of about £1200, and is held in fief by the family of Prince Bahrám Mirza, Muizz ed Dowleh (died 1882), grand-uncle of the Shah. Its chief town and the residence of the governor used to be Jóshekán-Káli, a large village with fine gardens, formerly famous for its carpets (*káli*), but now the chief place is Maimeh, a little city with a population of 2500, situated at an elevation of 6670 feet, about 63 miles from Isfahán in a north-westerly direction and 13 miles south-west of Jóshekán-Káli.

Joubert, Petrus Jacobus (1834–1900), commandant-general of the South African Republic from 1880 to 1900, was born at Cango, in the district of Oudtshoorn, Cape Colony, on 20th January 1834, an ancestor of his having been among the French Huguenots who fled to South Africa soon after the revocation of the Edict of Nantes by Louis XIV. Left an orphan at an early age, "Piet" Joubert, after enjoying a rudimentary education in his native home as a British subject, soon migrated to the Transvaal, where he settled in the Wakkerstroom district near Lang's Nek and the north-east angle of Natal. There he not only carried on the business of farmer with great success, but turned his attention to the study of the law. The esteem in which his shrewdness in both farming and legal affairs was held led to his election as the Volksraad member for Wakkerstroom early in the 'sixties, Pretorius being then in his second term of office as President. In 1870 Joubert was again elected, and the vigorous use to which he put his slender stock of legal knowledge secured him the appointment of attorney-general of the republic, while in 1874 he acted as President during the absence of Burgers in Europe. During the first British annexation of the Transvaal, Joubert earned for himself the reputation of a consistent irreconcilable by refusing to hold office under the Government, as Paul Kruger and other prominent Boers were doing. Instead of accepting the lucrative post offered him, he took a leading part in creating and directing the agitation which led to the war of 1880, eventually becoming, as commandant-general of the Boer forces, a member of the triumvirate that administered the provisional Boer government set up in 1880 at Heidelberg. He was in command at the battles of Lang's Nek, Ingogo, and Majuba Hill, subsequently conducting the earlier peace negotiations that led to the conclusion of the Pretoria Convention. In 1893 he opposed Kruger in the contest for the Presidency, the voting on that occasion (though there is reason for believing that the voting lists had been manipulated by Kruger's agents) being 7881 for Kruger and 7009 for Joubert, whilst at the next election in 1898 the voting was 12,858 for Kruger and 2001 for Joubert. Joubert's position had then become much weakened by accusations of treachery and of sympathy with the Uitlander agitation, and in order to clear his character of these imputations it became necessary for him to join those who advocated strong measures against the Jameson Raiders of 1896. He took little part in the negotiations that culminated in the ultimatum sent to Great Britain by Kruger in 1899, and though he immediately assumed nominal command of the operations on the outbreak of hostilities, he gave up to others the chief share in the direction of the war, through his inability or neglect to impose upon them his own will. His cautious nature, which had in early life gained him the sobriquet of "Slim Piet," linked with a lack of determination and assertiveness that characterized his whole career, led him to act mainly on the defensive; and the strategically offensive movements of the Boer forces, such as Elandslaagte and Willow Grange, appear to have been neither planned nor executed by him. As the war went on, physical weakness led to Joubert's virtual retirement, and, though two days earlier he was still reported as being in supreme command, he died at Pretoria from peritonitis on 28th March 1900. Sir George White, the defender of Ladysmith, summed up Joubert's character when he called him "a soldier and a gentleman, and a brave and honourable opponent." (J. A. J. DE V.)

Joule, James Prescott (1818–1889), English physicist, was born on 24th December 1818, at Salford, near Manchester. Although he received some instruction from John Dalton in chemistry, most of his scientific knowledge was self-acquired, and this was especially the case with regard to electricity and electro-magnetism, the subjects in which his earliest researches were carried out. From the first he appreciated to the full the importance of accurate measurement, and all through his life the attainment of exact quantitative data was one of his chief considerations. At the age of nineteen he invented an electro-magnetic engine, and in the course of examining its performance dissatisfaction with the vague and arbitrary methods then in vogue of specifying electrical quantities caused him to adopt a convenient and scientific unit, which he took to be the amount of electricity required to decompose nine grains of water in

one hour. In 1840 he was thus enabled to give a quantitative statement of the law according to which heat is produced in a conductor by the passage of an electric current, and in succeeding years he published a series of valuable researches on the agency of electricity in transformations of energy. One of these contained the first intimation of the achievement with which his name is most widely associated, for it was in a paper read before the British Association at its Cork meeting in 1843, and entitled the "Calorific Effects of Magneto-electricity and the Mechanical Value of Heat," that he expressed the conviction that whenever mechanical force is expended an exact equivalent of heat is always obtained. By rotating a small electro-magnet in water, between the poles of another magnet, and then measuring the heat developed in the water and other parts of the machine, the current induced in the coils, and the energy required to maintain rotation, he calculated that the quantity of heat capable of warming one pound of water one degree Fahr. was equivalent to the mechanical force which could raise 838 lb through the distance of one foot. At the same time he brought forward another determination based on the heating effects observable when water is forced through capillary tubes; the number obtained in this way was 770. A third method, depending on the observation of the heat evolved by the mechanical compression of air, was employed a year or two later, and yielded the number 798; and a fourth—the well-known frictional one of stirring water with a sort of paddle-wheel—yielded the result 890 (see *Brit. Assoc. Report*, 1845), though 781·5 was obtained by subsequent repetitions of the experiment. In 1849 he presented to the Royal Society a memoir which, together with a history of the subject, contained details of a long series of determinations, the result of which was 772. A good many years later he was entrusted by the Committee of the British Association on Standards of Electric Resistance with the task of deducing the mechanical equivalent of heat from the thermal effects of electric currents. This inquiry yielded (in 1867) the result 783, and this Joule himself was inclined to regard as more accurate than his old determination by the frictional method; the latter, however, was repeated with every precaution, and again indicated 772·55 foot-pounds as the quantity of work that must be expended at sea-level in the latitude of Greenwich in order to raise the temperature of one pound of water, weighed *in vacuo*, from 60° to 61° Fahr. Ultimately the discrepancy was traced to an error which, not by Joule's fault, vitiated the determination by the electrical method, for it was found that the standard ohm, as actually defined by the British Association Committee and as used by him, was slightly smaller than was intended; when the necessary corrections were made the results of the two methods were almost precisely congruent, and thus the figure 772·55 was vindicated. In addition, numerous other researches stand to Joule's credit—the work done in compressing gases and the thermal changes they undergo when forced under pressure through small apertures (with Lord Kelvin), the change of volume on solution (with Playfair), the change of temperature produced by the longitudinal extension and compression of solids, &c. It was during the experiments involved by the first of these inquiries that incidentally he was led to appreciate the value of surface condensation in increasing the efficiency of the steam engine. A new form of condenser was tested on the small engine employed, and the results it yielded formed the starting-point of a series of investigations which were aided by a special grant from the Royal Society, and were described in an elaborate memoir presented to it on 13th December 1860. His results, according to Lord Kelvin, led directly and speedily to the present practical method of surface-condensation, which is one of the most important improvements of the steam engine, especially for marine use, since the days of Watt. Joule died at Sale on 11th October 1889. His scientific papers were collected and published by the Physical Society of London: the first volume, which appeared in 1884, contained the researches for which he was alone responsible, and the second, dated 1887, those which he carried out in association with other workers.

Jovellar y Soler, Joaquin (1819–1892), captain-general of Spain, was born at Palma de Mallorca, 28th December 1819. At the close of his studies at the military academy he was appointed sub-lieutenant in 1836, went to Cuba as captain in 1842, returned to the War Office in 1851, was promoted major in 1853, and went to Morocco as private secretary to Marshal O'Donnell, who made him colonel in 1860 after Jovellar had been wounded at the battle of Wad el Ras. In 1863 Jovellar became a brigadier-general, in 1864 under-secretary for war, was severely wounded in fighting the insurgents in the streets of Madrid in 1866, and rose to the rank of general of division in 1866. Jovellar adhered to the revolution, and King Amadeus made him a lieutenant-general in 1872. He absented himself from Spain when the federal republic was proclaimed, and returned in the autumn of 1873, when Castelar sent him to Cuba as governor-general. In 1874 Jovellar came back to the peninsula, and was in command of the army of the Centre against the Carlists when Marshal Campos went to Sagunto to proclaim Alphonso XII. General Jovellar became war minister in the first cabinet of the restoration under Canovas, who sent him to Cuba again as governor-general, where he remained until 18th June 1878, when the Ten Years' Insurrection closed with the peace of Zaujon. Alphonso XII. made him a captain-general, president of the council, life-senator, and governor-general of the Philippines. Jovellar died in Madrid, 17th April 1892. (A. E. H.)

Jowett, Benjamin (1817–1893), Regius Professor of Greek and Master of Balliol College, Oxford, was born in Camberwell on 15th April 1817. His father was one of a Yorkshire family who, for three generations, had been supporters of the Evangelical movement in the Church of England. His mother was a Langhorne, in some way related to the poet and translator of Plutarch. At twelve the boy was placed on the foundation of St Paul's School, then in St Paul's Churchyard, and in his nineteenth year he obtained an open scholarship at Balliol, which became his home for the remaining fifty-eight years of his life. In 1838, while an undergraduate, he gained a fellowship, and graduated with first-class honours in 1839. Brought up amongst pious Evangelicals, he came to Oxford at the height of the Tractarian movement, and through the friendship of W. G. Ward was drawn for a time in the direction of High Anglicanism; but a stronger and more lasting influence was that of the Arnold school, represented by A. P. Stanley. Jowett was thus led to concentrate his attention on theology, and in the summers of 1845 and 1846, spent in Germany with Stanley, he became an eager student of German criticism and speculation. Amongst the writings of that period he was most impressed by those of F. C. Baur. But he never ceased to exercise an independent judgment, and his work on St Paul, which appeared in 1855, was the result of much original reflexion and inquiry. He was appointed to the Greek professorship in the autumn of that year. He had been a tutor of Balliol and a clergyman since 1842, and had devoted himself to the work of tuition with unexampled zeal. His pupils became his friends for life. He discerned their capabilities,

studied their characters, and sought to remedy their defects by frank and searching criticism. Like another Socrates, he taught them to know themselves, repressing vanity, encouraging the despondent, and attaching all alike by his unobtrusive sympathy. This work made gradually a strong impression, and those who cared for Oxford began to speak of him as "the great tutor." As early as 1839 Stanley had joined with Tait, the future archbishop, in advocating certain university reforms. From 1846 onwards Jowett threw himself into this movement, which in 1848 became general amongst the younger and more thoughtful Fellows, until it took effect in the Commission of 1850 and the Act of 1854. Another educational reform, the opening of the Indian civil service to competition, took place at the same time, and Jowett was one of the Commission. He had two brothers who served and died in India, and he never ceased to take a deep and practical interest in Indian affairs. A great disappointment, his repulse for the Mastership of Balliol, also in 1854, appears to have roused him into the completion of his book on *The Epistles of St Paul*. This work, described by one of his friends as "a miracle of boldness," is full of originality and suggestiveness, but its publication awakened against him a storm of theological prejudice, which followed him more or less through life. Instead of yielding to this, he joined with Henry Bristowe Wilson and Rowland Williams, who had been similarly attacked, in the production of the volume known as *Essays and Reviews*. This appeared in 1860 and gave rise to a strange outbreak of fanaticism. Jowett's loyalty to those who were prosecuted on this account was no less characteristic than his persistent silence while the augmentation of his salary as Greek professor was withheld. This petty persecution was continued until 1865, when, through the discoveries of two historical inquirers, Edward Freeman and Charles Elton, Christ Church was induced to raise the endowment from £40 a year to £500. Meanwhile Jowett's influence at Oxford had steadily increased. It culminated in 1864, when the country clergy, provoked by the final acquittal of the Essayists, had voted in Convocation against the endowment of the Greek chair. Jowett's pupils, who were now drawn from the university at large, supported him with the enthusiasm which young men feel for the victim of injustice. In the midst of other labours Jowett had been quietly exerting his influence so as to conciliate all shades of liberal opinion, and bring them to bear upon the abolition of the theological test, which was still required for the M.A. and other degrees, and for university and college offices. He spoke at an important meeting upon this question in London on 10th June 1864, which laid the ground for the University Tests Act of 1871. In connexion with the Greek professorship Jowett had undertaken a work on Plato which grew into a complete translation of the Dialogues, with introductory essays. At this he laboured in vacation time for at least ten years. But his interest in theology had not abated, and his thoughts found an outlet in occasional preaching. The university pulpit, indeed, was closed to him, but several congregations in London delighted in his sermons, and from 1866 until the year of his death he preached annually in Westminster Abbey, where Stanley had become dean in 1863. Three volumes of selected sermons have been published since his death. The years 1865–70 were occupied with assiduous labour. Amongst his pupils at Balliol were men destined to high positions in the State, whose parents had thus shown their confidence in the supposed heretic, and gratitude on this account was added to other motives for his unsparing efforts in tuition. His friends were multiplying, and to one friend, Mr Robert Lowe (afterwards Lord Sherbrooke), he owed the occasion which led, in 1870, to his election as Master of Balliol. From the vantage-ground of the Mastership the *Plato* was published in 1871. It had a great and well-deserved success. While scholars criticized particular renderings (and there were many small errors to be removed in subsequent editions), it was generally agreed that he had succeeded in making *Plato* an English classic. The sale, for a work of such dimensions, was unexpectedly rapid, and the call for a new edition soon made a fresh demand upon his time and energy.

BENJAMIN JOWETT.
(From a photograph by Elliott and Fry, London.)

If ever there was a beneficent despotism, it was Jowett's rule as Master. Since 1866 his authority in Balliol had been really paramount, and various reforms in college had been due to his initiative. The opposing minority were now powerless, and the younger fellows who had been his pupils were more inclined to follow him than others would have been. There was no obstacle to the continued exercise of his firm and reasonable will. He still knew the undergraduates individually, and watched their progress with a vigilant eye. His influence in the university was less assured. The pulpit of St Mary's was no longer closed to him, but the success of Balliol in the Schools gave rise to jealousy in other colleges, and old prejudices did not suddenly give way; while a new movement in favour of "the endowment of research" ran counter to his immediate purposes. Meanwhile, the tutorships in other colleges, and some of the headships also, were being filled with Balliol men, and Jowett's former pupils were prominent in both Houses of Parliament and at the Bar. He continued the practice, which he had commenced in 1848, of taking with him a small party of undergraduates in vacation time, and working with them in one of his favourite haunts, at Askrigg in Wensleydale, or Tummel Bridge, or later at West Malvern. The new hall (1876), the organ there, entirely his gift (1885), and the cricket ground (1889), remain as external monuments of the Master's activity. Neither business nor the many claims of friendship interrupted literary work. The six or seven weeks of the long vacation, during which he had pupils with him, were mainly employed in writing. The translation of Aristotle's *Politics*, the revision of the *Plato*, and, above all, the translation of Thucydides many times revised, occupied many years. The edition of the *Republic*,

undertaken in 1856, remained unfinished, but was continued with the help of Professor Lewis Campbell. Other literary schemes of larger scope and deeper interest were long in contemplation, but were not destined to take effect —an *Essay on the Religions of the World*, a *Commentary on the Gospels*, a *Life of Christ*, a volume on *Moral Ideas*. Such plans were frustrated, not only by his practical avocations, but by his determination to finish what he had begun, and the fastidious self-criticism which it took so long to satisfy. The book on *Morals* might, however, have been written, but for the heavy burden of the vice-chancellorship, which he was induced to accept in 1882, by the hope, only partially fulfilled, of securing many improvements for the university. The vice-chancellor was *ex officio* a Delegate of the Press, where he hoped to effect much; and a plan for draining the Thames valley, which he had now the power of initiating, was one on which his mind had dwelt for many years. Though his aims were often balked, he made a great impression; but some of his friends will always regret that a time so precious should not rather have been devoted to some work of moral and spiritual import which might have been a possession for the world at large. The exhausting labours of the vice-chancellorship were followed by an illness (1887); and after this he seems to have relinquished the hope of producing any great original writing. His literary industry was thenceforth confined to his Commentary on the *Republic* of Plato, and some essays on Aristotle which were to have formed a companion volume to the translation of the *Politics*. The essays which should have accompanied the translation of Thucydides were never written. He died on the 1st of October 1893, at the age of seventy-six. The funeral was one of the most impressive ever seen in Oxford. The pall-bearers were seven Heads of colleges and the Provost of Eton, all old pupils. Balliol chapel was filled to overflowing with a distinguished gathering. Amongst the many wreaths was one from Miss Florence Nightingale, inscribed "To the genius of friendship." Jowett never married.

Theologian, tutor, university reformer, a great Master of a college, Jowett's best claim to the remembrance of succeeding generations was his greatness as a moral teacher. Very many of those who towards the end of the 19th century were the salt of the nation owed much of what they were to his precept and example, his penetrative sympathy, his insistent criticism, and his unwearying friendship. To name a mere fraction of what can never be known in full, the list of his pupils and lifelong friends includes a Speaker of the House of Commons, three Indian Viceroys, two Cabinet Ministers, four judges, several canons, and a dean. Seldom have ideal aims been so steadily pursued with so clear a recognition of practical limitations. As a theologian Jowett's work was transitional, and yet has an element of permanence. As has been said of another thinker, he was "one of those deeply religious men who, when crude theological notions are being revised and called in question, seeks to put new life into theology by wider and more humane ideas." In earlier life he had been a zealous student of Kant and Hegel, and to the end he never ceased to cultivate the philosophic spirit; but he had little confidence in metaphysical systems, and sought rather to translate philosophy into the wisdom of life. As a classical scholar, his scorn of littlenesses sometimes led him into the neglect of *minutiæ*, but he had the higher merit of interpreting ideas. His place in literature will not be recognized until the essays which lie buried in the five volumes of his *Plato* have been published separately. It will then be found that his worth, as a teacher of his countrymen, extends far beyond his own generation.

See *The Life and Letters of Benjamin Jowett*, by ABBOTT and CAMPBELL, 1897; *Benjamin Jowett*, by LIONEL TOLLEMACHE, 1895. (L. C.)

Jub, or JUBA, an important river of East Africa, flowing south across the Galla and Somali countries from the outer margin of the Abyssinian highlands. Of its three principal head-streams, the largest appears to be that known as the Ganana, itself formed by the junction of the Ganale Guracha (Black Ganale, a rushing stream 100 yards wide) and the Ganale Gudda (Great Ganale). The latter, the most remote source of the Jub, rises in 7½° N., 39°–40° E., at the foot of the mountains which traverse the country of the Arussi Gallas—of which Mount Fakez rises to a height of 10,000 feet—and is swelled by the junction of various streams rising in the same mountains. In the vicinity of its sources the river flows at an altitude of 7400 feet. In 4° 12′ N. and about 42° E. the Ganana is joined on the left by the Web, which rises in the Worgoma mountains (7° N., 40° E.), and some 40 miles from its source passes, first through a cañon 500 feet deep, and then through a series of remarkable underground caves hollowed out of a quartz mountain, and, with their arches and white columns, presenting the appearance of a pillared temple. At the point of junction the Ganana or Jub is a swift river 85 yards wide, but at the Buntal ferry, 10 miles lower down, it widens to 200 yards, the altitude being here only 590 feet. Just above the ferry, the Daua, the third head-stream of the Jub, enters from the west. It rises between 6° and 7° N., but has few feeders, and in its lower course is only 40 yards wide and from 2 to 3 feet deep. In its middle course it traverses a mountainous country by a deep and narrow gorge. Below the Daua the Jub receives no tributary of importance. It first flows in a valley bounded, especially towards the west, by the escarpments of a high plateau, and containing the towns of Lugh (in 4°, the centre of active trade), Bardera (population about 1200), and Saranli—the two last on opposite sides of the stream, in 2° 20′, a crossing-place for caravans. Beyond 1° 45′ the country becomes more level and the course of the river very tortuous. On the west a series of small lakes and backwaters receive water from the Jub during the rains. Just south of the equator the emissaries of the long, branching lake Deshekwama or Hardinge, fed by the Lakjhera river, enter from the west, and in 0° 15′ S. the Jub enters the sea across a dangerous bar, which has only one fathom of water at high tide. Below 2° 35′ N., at which rapids occur, the lower Jub is navigable for a shallow-draught steamer, having a general depth of from 4 to 12 feet, though shallower in places. Just above its mouth it is a fine stream 250 yards wide, with a current of 2½ knots. The country through which the Jub and its branches flow is generally arid, except in the mountainous districts near its head-waters. Here some tropical forest occurs, but otherwise the surface away from the river banks is either bare or covered with thorny scrub. On the lower river the Gosha district on the west bank, between 0° and 1° N., still contains forest, but it is being rapidly cleared for cultivation. The lower Jub was ascended in 1865 in a steamer by Baron von der Decken, who met his death at Bardera, but the system of the river remained otherwise almost unknown until after 1890. In 1891 a survey of its lower course was executed by Captain Dundas, while in 1892–93 its head-streams were explored by the Italians Bóttego and Grixoni, the former of whom disproved the supposed connexion of the Omo (see RUDOLF, LAKE) with its system. It has since been further explored by Ruspoli, by Bóttego's second expedition, and by Donaldson Smith and others.

See especially DUNDAS in *Geog. Journal*, March 1893; BÓTTEGO, *Il Giuba Esplorato*. Rome, 1895. (E. HE.)

Jubbulpore, or JABALPUR, a city, district, and division of British India, Central Provinces. The city is 616 miles north-east of Bombay by rail, and 220 miles south-west of Allahabad. Population (1881), 75,705; (1891), 84,481; (1901), 89,708, showing an increase of 6 per cent., compared with 12 per cent. in the preceding decade. Jubbulpore is a modern town, well laid out, with fine artificial lakes in the suburbs. Formerly the capital of the Saugor and Nerbudda territories, it is now the headquarters of the Nerbudda military district, with cantonments for a battery of artillery, a European infantry and a Bombay native infantry regiment. It is also one of the most important railway centres in India, being the junction of the Great Indian Peninsula and the East Indian systems. It has a steam cotton-mill, with 154 looms and 15,300 spindles, employing 700 hands, and pottery works, employing 336 hands, with an out-turn valued at Rs.85,000. The Government college, educating for the science course of the Allahabad University, had 93 students in 1896–97; there were three aided high schools with 1547 pupils, a law class, an engineering class, and normal schools for male and female teachers. There is a Government school of industry for Thug and Dacoit approvers, where tents and carpets are turned out on a large scale. There are four printing-presses, issuing two English newspapers, and several clubs and libraries. A native association, established in 1869, supports an orphanage, with help from Government. A zenana mission manages 13 schools for girls. Waterworks were constructed in 1882, out of a loan advanced by a native banker, and a drainage scheme is under construction. The district of JUBBULPORE lies on the watershed between the Nerbudda and the Sone, but mostly within the valley of the former river, which here runs through the famous gorge known as the Marble Rocks. Area, 3948 square miles. The population in 1881 was 687,233; in 1891, 748,146, showing an increase of 9 per cent.; average density, 189 persons per square mile. In 1901 the population was 680,485, showing a decrease of 9 per cent., due to the results of famine. The land revenue was Rs.9,42,740, the incidence of assessment being under 8 annas per acre; cultivated area (1897–98), 889,320 acres, of which 2819 were irrigated; number of police, 762; boys at school (1896–97), 9935, being 17·6 per cent. of the male population of school-going age; girls at school, 1519, being 2·7 per cent.; registered death-rate (1897), 61·26 per thousand. The principal crops are wheat, rice, pulse, and oil-seeds. A good deal of iron smelting with charcoal is carried on in the forests. The district is traversed by the main railway from Bombay to Calcutta, and by new branches of two other lines which meet at Katni junction. Jubbulpore suffered severely in the famine of 1896–97, the distress being aggravated by immigration from the adjoining native states. Fortunately the famine of 1900 was less severely felt here. The division of JUBBULPORE lies mainly among the Vindhyan and Satpura hill systems. It comprises the five following districts: Jubbulpore, Saugor, Damoh, Seoni, and Mandla. Area, 19,040 square miles; population (1881), 2,201,633; (1891), 2,375,642, showing an increase of 8 per cent.; average density, 124 persons per square mile, ranging from 189 in Jubbulpore to 67 in Mandla.

Jujuy, a province in the north-west of the Argentine Republic, bounded on the N. and W. by Bolivia, and on the E. and S. by the Argentine province of Salta. The official area at the census of 1895 was 18,977 square miles. Population (1869), 40,379; (1900), 94,405. The province, which is divided into thirteen departments, contained in 1895, 3103 farms, and 19,898 acres planted with cereals. The capital, JUJUY, on the Rio Grande, has a population of about 5000, and is connected with Buenos Aires by rail.

Jullien, Louis Antoine (1812–1860), musical conductor, was born at Sisteron, Basses Alpes, France, on the 23rd of April 1812, and studied at the Paris Conservatoire. His fondness for the lightest forms of music cost him his position in the school, and after conducting the band of the Jardin Turc, he was compelled to leave Paris to escape his creditors, and came to London, where he formed a good orchestra and established promenade concerts. Subsequently he travelled to Scotland, Ireland, and America with his orchestra. For many years he was a familiar figure in the world of popular music in England, and his portly form with its gorgeous waistcoats occurs very often in the early volumes of *Punch*. He brought out an opera, *Pietro il Grande*, at Covent Garden, in 1852, on a scale of magnificence that ruined him, for the piece was a complete failure. He was in America until 1854, when he returned to London for a short time; ultimately he went back to Paris, where, in 1859, he was arrested for debt and put into prison. He lost his reason soon afterwards, and died 14th March 1860.

Jullundur, or JALANDHAR, a city of British India, giving its name to a district and to a division in the Punjab. The city is 260 miles by rail north-west of Delhi. Population (1881), 52,119; (1891), 66,202, showing an increase of 27 per cent.; municipal income (1897–98), Rs.67,040. It is a cantonment for artillery and a European and native infantry regiment. There are an American Presbyterian mission, Government normal school, and high schools supported by Hindu bodies. It has five printing-presses, issuing four vernacular periodicals. The registered death-rate in 1897 was 30 per thousand. The district of JULLUNDUR occupies the lower part of the tract known as the Jullundur Doab, between the rivers Sutlej and Bias, except that it is separated from the Bias by the state of Kapurthala. Area, 1223 square miles. The population in 1881 was 789,555; in 1891, 907,583, showing an increase of 15 per cent.; average density, 633 persons per square mile, being the highest in the province. In 1901 the population was 917,896, showing an increase of only 1 per cent. The land revenue and rates were Rs.16,30,134, the incidence of assessment being R.1:11:4 per acre, again considerably the highest in the province; cultivated area (1896–97), 721,527 acres, of which 398,815 were irrigated from private wells; number of police, 257; number of schools (1896–97), 421, with 12,526 pupils, the proportion of boys at school to male population of school-going age being 13·9 per cent.; registered death-rate (1897), 25·7 per thousand. The district is crossed by the main line of the North-Western Railway from Phillour towards Amritsar—49 miles in all. There are 157 miles of metalled road and 80 miles of navigable river, but no Government canal. The division of JULLUNDUR comprises the five districts of Kangra, Hoshiarpur, Jullundur, Ludhiana, and Ferozepore, all lying along the river Sutlej. Area, 19,008 square miles. The population in 1881 was 3,787,945; in 1891, 4,217,664, showing an increase of 11 per cent.; average density, 222 persons per square mile.

Jumilla, a town of Spain, in the province of Murcia. The trade and local industries have considerably increased, and include linen, wine, safran, esparto grass, and phosphorite from mines in the neighbourhood. On a hill close to the town several old sepulchres were discovered in 1892. Population, 15,633.

Junagarh, a native state of India, within the Gujarat division of Bombay, extending inland from the southern coast of the peninsula of Kathiawar. Area,

3283 square miles; population (1881), 387,499; (1891), 484,190; estimated gross revenue, Rs.26,62,500, of which Rs.3,99,350 was expended on public works in 1897–98; tribute to the British Government and the Gaekwar of Baroda, Rs.65,604; but a considerable sum is also received as tribute from minor states in Kathiawar. The state is traversed by a railway from Rajkot to the seaport of Verawal. It includes the sacred mountain of Girnar and the ruined temple of Somnath. The town of JUNAGARH is 60 miles by rail south from Rajkot. Population (1881), 24,679; (1891), 31,640, showing an increase of 29 per cent., due to the progressive administration of the Nawab. The modern town is handsomely built and laid out. In November 1897 Lord Sandhurst, Governor of Bombay, laid the foundation-stones of a new hospital as well as of a library and museum. The high school had 460 pupils in 1896–97. There are three printing-presses, one of which issues an official gazette.

Juneau, formerly HARRISBURG, a mining settlement on the continental shore of Gastineau Channel, south-east Alaska, in 58° 16′ N. and 134° 20′ W., opposite Douglas Island and the properties of the Treadwell mine on the island shore. It was settled in 1880 by two prospectors named Joseph Juneau and Richard Harris. Its prosperity is due to the mines of gold and silver in the adjacent Silver Bow basin and those of Douglas Island. The latter comprise mills of 880 stamps and one of the largest and most profitable of low-grade ore deposits. It has a custom-house, U.S. court-house, several churches, a hospital and schools; but, owing to want of room for growth between the precipitous mountains and the water, and to other causes, Douglas, on the island of the same name, and Skagway, the port for the Yukon mines, are overtaking Juneau, and bid fair to outgrow it in population and business. Population, 2650 (including 450 Indians).

Jung-Bunzlau, the chief town of a government district in Bohemia, 30 miles north-north-east of Prague. It has a garrison of 879 men, and has an important corn trade, textile industries, and manufactures of sugar, starch, soap, beer and spirits, and flour. Population (1890), 11,518; (1900), 13,479, mostly Czech and Roman Catholic.

Junin, an interior department of Central Peru, contained a population of 394,393 in 1896. The provinces are Cerro de Pasco, Tarma, Jauja, and Huancayo, and the principal towns, Tarma (6000), Jauja (15,000), and Pasco (15,000).

Junker, Wilhelm (1840–1892), German explorer, was born at Moscow on the 6th April 1840. He studied medicine at Dorpat, Göttingen, Berlin, and Prague, but did not practise this profession for long. After a series of short journeys to Iceland, Tunis, and Lower Egypt, he remained almost continuously in Africa from 1875 to 1886, making Khartum the base of his expeditions into the interior. He joined marauding bands sent out by the Egyptians into the Mahdi's country, and was an unwilling witness of many scenes of great atrocity. Junker, unlike most explorers, was a leisurely traveller and a careful observer; his main object was to study the peoples with whom he came into contact, and to collect specimens of plants and animals, and the result of his investigations in these particulars is given in his *Reisen in Afrika* (3 vols. Vienna, 1889–91), a work of high merit. But perhaps the greatest service he rendered to geographical science was his investigation of the area intersected by the tributaries of the Nile, when he successfully combated Schweinfurth's hydrographical theories and established the identity of the Wellé and Mobangi. On the outbreak of the Mahdi's insurrection in 1884 he was cut off and isolated, and an expedition, fitted out in 1885 by his brother in St Petersburg, failed to reach him; he succeeded, however, unaided, in reaching Zanzibar in December 1886, and thence returned to Germany. In 1887 he received the gold medal of the Royal Geographical Society in London. As an African explorer Junker is entitled to the highest rank, and must be classed with such men as Speke and Nachtigal. He died at St Petersburg on the 13th February 1892.

Jura, a department on the eastern frontier of France, bordering on Switzerland.

Area, 1951 square miles. The population decreased from 281,292 in 1886 to 259,212 in 1901. Births in 1899, 5624, 284 of them illegitimate; deaths, 5626; marriages, 1933. There were in 1896 1001 schools, with 45,000 pupils, and the illiterate composed less than 1 per cent. of the population. Out of 1,052,706 acres of cultivated land in 1896, 390,440 were plough-land and 37,060 vineyards. In 1899 wheat returned a value of £446,000; oats, £132,000; barley, £64,000; vines, £220,000—from the vineyards of Arbois. The natural pastures and grass lands on the high plateaux yielded in 1899 a value of £538,000. The live stock included (1899) 155,940 cattle, 13,840 horses, 15,650 sheep, and 48,160 pigs. The dairy produce yielded a revenue of not less than £800,000. The mining industry in 1898 registered 2000 metric tons of peat, 4000 tons of iron, and 21,400 tons of rock-salt. The extensive industry in metals produced in 1898, 18,000 metric tons of iron and 19,000 tons of steel, valued at £281,000. The other industries are in a backward state.

Jurien de la Gravière, Jean Baptiste Edmond (1812–1892), French admiral, son of Admiral Jurien, who served through the Revolutionary and Napoleonic wars and was a peer of France under Louis Philippe, was born on 19th November 1812. He entered the navy in 1828, was made a commander in 1841, and captain in 1850. During the Russian war he commanded a ship in the Black Sea. He was promoted to be rear-admiral on 1st December 1855, and appointed to the command of a squadron in the Adriatic in 1859, when he absolutely sealed the Austrian ports with a close blockade. In October 1861 he was appointed to command the squadron in the Gulf of Mexico, and two months later the expedition against Mexico. On 15th January 1862 he was promoted to be vice-admiral. During the Franco-German war of 1870 he had command of the French Mediterranean fleet. In 1871 he was appointed "director of charts." As having commanded in chief before the enemy, the age limit was waived in his favour, and he was continued on the active list. He had been given the Cross of the Legion of Honour in 1854, and the rank of Officer of the order in 1865; he received the Grand Cross in 1876. He died on 4th March 1892. He was a voluminous author of works on naval history and biography, most of which first appeared in the *Revue des Deux Mondes*. Among the most noteworthy of these are *Guerres Maritimes sous la République et l'Empire*, which was translated by Lord Dunsany under the title of *Sketches of the last Naval War; Souvenirs d'un Amiral*, that is, of his father, Admiral Jurien; *La Marine d'Autrefois* (1865), largely autobiographical; *La Marine d'Aujourd'hui* (1872). In 1866 he was elected a member of the Academy. (J. K. L.)

Jurua. See AMAZON.

Jutland, in Danish, *Jylland*, the ancient Chersonese or Cimbric peninsula, the continental portion of the kingdom of Denmark. It stretches from Kolding and Ribe northwards to the Skaw (*Skagen*), and embraces nine counties (Vejle, Aarhus, Randers, Aalborg, Hjörring, Thisted, Viborg, Ringkjöbing, and Ribe), with an aggregate area of 9762 square miles. Population (1880), 868,511; (1890), 942,120; (1900), 1,063,792. Although in ancient times well wooded, the greater portion of the interior consisted for centuries of barren drift-sand, which grew

nothing but heather; but since 1866, chiefly through the instrumentality of the patriotic Heath Association, assisted by annual contributions from the State, a very large proportion of this region has been more or less reclaimed for cultivation. The means adopted are (i.) the plantation of trees; (ii.) the making of irrigation canals and irrigating meadows, amounting by 1901 to over 100 canals of a total length of 236 miles, and close upon 16,500 acres of meadows; (iii.) exploring for, extracting, and transporting loam, for which purpose short light railways (over 30 miles at the end of 1900) have been built; (iv.) and, since 1889, the experimental cultivation of fenny districts. The activity of the association takes the form partly of giving gratuitous advice, partly of experimental attempts, and partly of model works for imitation. The State also makes annual grants directly to owners who are willing to place their plantations under State supervision, for the sale of plants at half price to the poorer peasantry, for making protective or sheltering plantations, and for free transport of marl or loam. At the end of 1900 the Heath Association exercised supervision over some 124,280 acres of heath, while the State administered another 112,350 acres (including *klit* or barren lands); and private owners had in their own hands an additional 27,280 acres of heath. Of all this area of 263,900 acres, about one-half was planted with trees. The species of timber almost exclusively planted are the "red fir" (*Picea excelsa*) and the "mountain pine" (*Pinus montana*). In this way the total area of barren dunes, heaths, and fens has been reduced from 2850 square miles in the middle of the 19th century to 1314 square miles at its end, or a gain to cultivation of close upon 1,000,000 acres; and the population has increased at a more rapid rate than in any other part of the Danish kingdom. In 1860 the population of the three administrative districts of Viborg, Ringkjöbing, and Ribe, in which the heaths are mostly situated, numbered 181,000, or 44·3 inhabitants to the square mile, but by 1890 had increased to 249,000, or 60·9 inhabitants to the square mile, and by 1900 to 313,764, or 76·7 to the square mile. The coasts being flat, and the seas off them shallow, and storms being frequent, a chain of lifeboat stations has been established all round North Jutland. Between the first organization of the lifeboat service in 1852 and 1899 there were 3047 wrecks on the coasts of Denmark, *i.e.*, mostly off Jutland, or an average of 63·4 every year. During the same period 7171 persons were rescued from drowning, or an average of 149·4 lives saved annually.

The particulars about the Heath Association have been kindly communicated by Hr. Borch, the manager of the Association in Aarhus. See further various pamphlets of the Heath Association (in Danish); also *Oldsagn paa Alheden*, *E Bindstouw*, and other works by S. S. BLICHER (*Samlede Noveller og Skizzer*, 4 vols. 1882), a son of the heath country; *Aarbog for Dansk Kulturhistorie* (Aarhus, 1891 *et seq.*); *Geografiske Billeder fra Heden* (1867–1868), and other works by E. M. DALGAS, the founder of the Heath Association; or the summary by A. OPPERMANN, "Dalgas og Hedeplantningen," in *Tilskueren* (1894, p. 425 *et seq.*). (J. T. BE.)

A PARTIAL LIST OF THE CONTRIBUTORS

TO

THE NEW VOLUMES

OF

THE ENCYCLOPÆDIA BRITANNICA

WITH THE INITIALS WHICH HAVE BEEN AFFIXED TO THEIR RESPECTIVE ARTICLES.

THE LIST OF CONTRIBUTORS here given is necessarily incomplete, inasmuch as the later Volumes are still in course of preparation, and all the Contributors have not yet been selected. On the other hand, the present List may contain a few names which ultimately will not appear in the final List of Contributors. Death or other cause may prevent certain writers who have undertaken the preparation of Articles from completing the contributions which they were to furnish. A full List, compiled when the final Volume goes to press, will be given later. The present List includes the names of all who have written signed Articles for the Volumes which have so far appeared.

After the few words of description which accompany the names are given the initials of the different authors as they have been affixed to the Articles contributed by them.

The Publishers congratulate themselves that in this List of a thousand names are to be found not only the most famous scholars and writers of Great Britain, but of the whole world.

A

ABBE, Prof. Cleveland, A.M., Ph.D., LL.D.; Meteorologist, U.S. Weather Bureau; author of 'Atmospheric Radiation,' etc.; editor of 'Monthly Weather Review'; Lecturer on Meteorology, Johns Hopkins University. (C. A.)

ABBOTT, Rev. Lyman, D.D.; editor of 'The Outlook' (New York); associate editor of 'The Christian Union' (New York) with Henry Ward Beecher, whom he succeeded as pastor of Plymouth Church, Brooklyn; author of 'Christianity and Social Problems,' 'Life of Christ,' 'Theology of an Evolutionist,' 'Life and Epistles of St Paul.' (L. A.)

ABNEY, Sir William de Wiveleslie, K.C.B., D.Sc., D.C.L., F.R.S.; Principal Assist. Sec., Board of Education, South Kensington, since 1899; President, Royal Astronomical Society, 1893-95; President, Physical Society, 1895-97; author of 'Photography' in Ninth Edition of the 'Ency. Brit.,' 'Instruction in Photography,' 'Treatise on Photography,' 'Colour Vision,' 'Colour-Measurement and Mixture,' 'Thebes and its Five Great Temples,' in part of 'The Pioneers of the Alps.' (W. DE W. A.)

ADAMS, B. B.; associate-editor of the 'Railroad Gazette' (New York). (B. B. A.)

AIRY, Wilfred, B.A., M.I.C.E.; Examiner of Inspectors of Weights and Measures, Board of Trade; author of 'Levelling and Geodesy,' 'Weighing Machines,' etc. (W. AY.)

AKERS, C. E.; author of 'Argentine, Patagonian, and Chilian Sketches,' etc. (C. E. A.)

ALCOCK, Charles William; Secretary Surrey County Cricket Club since 1872; Hon. Sec. Football Association, 1867-90; author of 'Football our Winter Game,' 1867; editor of 'Cricket Newspaper,' 1882-1900, 'Football Annual,' 'Cricketer's Annual' (Lillywhite's), etc. (C. W. A.)

ALEXANDER, Gen. Edward Porter; General of Ordnance; and later Brigadier-General of Artillery and Chief of Artillery in Gen. Longstreet's Corps, Confederate Army. (E. P. A.)

ALEXANDER, W. D., Honolulu; author of 'A Brief History of the Hawaiian People.' (W. D. A.)

ALLBUTT, Thomas Clifford, M.A., M.D., LL.D., D.Sc., F.R.S.; Regius Professor of Physic, Camb., since 1892; Commissioner in Lunacy, 1889-92; author of 'The Ophthalmoscope in Medicine,' 'Goulstonian Lectures (On Visceral Neuroses),' 'On Scrofula,' 'Science and Medical Thought'; editor of 'System of Medicine and Gynæcology,' etc.; inventor of short clinical thermometer. (T. C. A.)

ALLDRIDGE, T. J., F.R.G.S., F.Z.S.; for many years Travelling Commissioner of Sierra Leone; District Commissioner of Sherbro District, Sierra Leone; author of 'The Sherbro and its Hinterland.' (T. J. A.)

ANDERSON, Miss A. M.; Principal Lady Inspector of Factories, Home Office. (A. M. AN.)

ANDERSON, W., F.R.C.S., the late; Comp. of the Order of the Rising Sun (Japan); Professor at Royal Academy; Chairman of Council of the Japan Society; Medical Director, Imperial Naval Medical College, Tokio; author of 'The Pictorial Arts of Japan,' 'Japanese Wood Engravings,' 'Cat. of Chinese and Japanese Pictures in British Museum.' (W. AN.)

ANDERSON, Lt.-Col. W. P.; Chief Engineer and Superintendent of Lights, Department of Marine and Fisheries, Ottawa, Canada. (W. P. A.)

ANDREWS, Hon. Elisha Benjamin, LL.D.; Chancellor of the University of Nebraska; late Superintendent of Schools of the City of Chicago; formerly President of Brown University; author of 'Institutes of General History,' 'Institutes of Economics,' 'History of the United States,' etc. (E. B. A.)

ANSTRUTHER-THOMSON, Major W., F.G.S., F.S.A.; Inspector of Concentration Camps, S.A. (W. A.-T.)

ARCHER, William; dramatic critic of 'World' (London), 1884 onwards; edited and translated Ibsen's 'Prose Dramas'; author of 'Life of Macready,' 'Masks or Faces,' 'The Theatrical World,' 'Study and Stage,' 'America To-day, 1900,' 'Poets of the Younger Generation,' etc. (W. A.)

ARMSTRONG, Edmund Archibald, Barrister-at-Law, Inner Temple. (E. A. AR.)

ARMSTRONG, Henry Edward, Ph.D., LL.D., F.R.S.; Professor of Chemistry at the City and Guilds of London Central Institute, South Kensington; author of 'Carbon,' etc., in Ninth Edition of 'Ency. Brit.,' 'Introduction to the Study of Organic Chemistry.' (H. E. A.)

ARMSTRONG, Sir Walter; Director of the National Gallery of Ireland; author of 'Sir Joshua Reynolds,' 'Thomas Gainsborough,' 'Sir Henry Raeburn,' 'Alfred Stevens,' 'Peter de Wint,' 'Velasquez,' 'Scottish Painters,' 'J. M. W. Turner,' etc., and co-editor of 'Bryan's Dictionary of Painters.' (W. AR.)

ASHWORTH, Philip A., Dr. Juris, of the Inner Temple, Barrister-at-Law; editor of Taswell-Langmead's 'Constitutional History of England,' translator of Gneist's 'History of the English Constitution,' etc. (P. A. A.)

ASKWITH, Rev. Edward Harrison, M.A., B.D.; Chaplain of Trinity College, Cambridge; author of 'Christian Conception of Holiness,' 'Epistle to the Galatians,' etc. (E. H. A.)

ASTON, Major George Grey, R.M.A.; late Professor of Fortification, Royal Naval College, Greenwich. (G. G. A.)

ASTON, William George, B.A., M.A., Hon. D.Lit., C.M.G.; student interpreter in Japan, 1864; interpreter and translator to British Legation at Yedo, 1870; assistant Japanese Secretary, Yedo, 1875-82; acting Consul, Hiogo, 1880-83; Consul-General for Corea, 1884; Japanese Secretary, Tokio, 1886; author of 'A Grammar of the Japanese Spoken Language,' 'A Grammar of the Japanese Written Language,' 'A Translation of the Nihongi, or Annals of Ancient Japan,' 'History of Japanese Literature,' etc. (W. G. AS.)

ATWATER, Wilbur Olin, Ph.D.; Professor of Chemistry, Wesleyan University, U.S.A.; Special Agent of the U.S. Department of Agriculture in charge of Nutrition investigations. (W. O. A.)

AVES, Ernest, M.A.; formerly Sub-Warden of Toynbee Hall; author of papers on sociology and economics. (E. A*.)

AXON, William Edward Armitage, LL.D.; late Dep. Librarian Manchester Free Libraries; author of 'Manchester' in Ninth Edition of 'Ency. Brit.,' 'The Annals of Manchester,' 'Manchester a Hundred Years Ago,' 'Lancashire Gleanings,' 'Stray Chapters in Literature,' 'Folk-lore and Archæology,' etc. (W. E. A. A.)

B

BACON, Edwin Monroe, M.A.; editor of 'Time and the Hour' (Boston, U.S.A.); sometime editor-in-chief of the 'Boston Globe,' the 'Boston Advertiser,' and the 'Boston Post'; author of 'Boston Illustrated,' 'Bacon's Dictionary of Boston,' 'Boston of To-day,' etc. (E. M. B.)

BADEN-POWELL, Maj. Baden F. S.; inventor of man-lifting kites; late President Aëronautical Society; author of 'In Savage Isles and Settled Lands,' many articles on ballooning, etc. (B. F. S. B.-P.)

BAGWELL, Richard, M.A.; author of 'Ireland' in the Ninth Edition of the 'Ency. Brit.,' 'Ireland under the Tudors,' 'A Plea for National Education,' etc. (R. BA.)

BAINES, Jervoise Athelstane, C.S.I.; Hon. Sec. (gold medallist) and Vice-President Royal Statistical Society; Census Commissioner under Government of India, 1889-93; employed at India Office and as secretary to Royal Commission on Opium, 1894-95; author of Official Reports on Provincial Administration, on Indian Census Operations, 1881-91, on Indian Progress, 1894, many papers, ethnographic and statistical, for London societies. (J. A. B.)

BAKER, Henry Frederick, M.A., F.R.S.; Fellow and Lecturer of St John's College, Cambridge; University Lecturer in Mathematics. (H. F. BA.)

BALCARRES, Lord, M.P., F.S.A., F.S.A.S.; Trustee of National Portrait Gallery, London; Hon. Sec. Society for Protection of Ancient Buildings; Vice-Chairman of National Trust. (B.)

BALDRY, Alfred Lys, artist; author of 'Albert Moore: his Life and Works,' 'The Life and Works of Marcus Stone, R.A.,' 'Sir John Everett Millais,' 'Hubert von Herkomer,' etc. (A. L. B.)

BALDWIN, Hon. Simeon Eben, A.M., LL.D.; Judge of the Supreme Court of Errors of Connecticut; Professor of Constitutional and Mercantile Law, Corporations, and Wills, Yale University; sometime President of the American Bar Association and American Social Science Association; author of 'Baldwin's Connecticut Digest,' 'Cases on R.R. Law,' 'Modern Political Institutions,' etc. (S. E. B.)

BALDWIN, W. H., Jr.; President of the Long Island R.R. Co., U.S.A. (W. H. B.)

BALE, Edwin, R.I.; Art Director, Cassell and Company; Hon. Sec. Artists' Committee for Promoting Art Copyright Bill, etc. (E. BA.)

BALFOUR, Isaac Bayley, M.D., D.Sc., M.A., F.R.S., F.L.S.; Regius Keeper of Royal Botanic Garden, Edinburgh; Professor of Botany, University of Edinburgh; Transit of Venus Expedition to Rodriguez, 1874; Regius Professor of Botany, University of Glasgow, 1879-84; explored island of Socotra, 1880; Sherardian Professor of Botany, University of Oxford, and Fellow of Magdalen College, 1884-88; author of 'Botany of Rodriguez,' 'Botany of Socotra,' editor of 'Annals of Botany.' (I. B. B.)

BANCROFT, Frederic, Ph.D.; Chief of Bureau of Rolls and Library, U.S. Department of State; author of 'Life of William H. Seward,' etc. (F. BA.)

London; Hon. Fellow of Balliol Coll. Oxford; presided over the Royal Commission on the Irish Land Acts, 1897-98; author of 'Quakers' in Ninth Edition of 'Ency. Brit.,' 'The Specific Performance of Contracts,' 'British Mosses,' 'James Hack Tuke,' etc. (E. F.)

FULTON, Robert Burwell, A.M., LL.D.; Chancellor of the University of Mississippi; author of 'Mississippi, State' in Ninth Edition of 'Ency. Brit.' (R. B. F.)

G

GADOW, Hans Friedrich, Ph.D., Hon. M.A. Cambridge, F.R.S.; Strickland Curator and Lecturer on Zoology, Cambridge; British Museum, Natural History Department, 1880-82; author of 'In Northern Spain,' 'A Classification of Vertebrata,' 'Aves in Bronn's Animal Kingdom,' 'Amphibia and Reptiles,' and papers in Royal Society Philosophical Transactions and other scientific periodicals. (H. F. G.)

GALLWEY, Lt.-Col. Henry Lionel, C.M.G., D.S.O.; Deputy Commissioner and Consul, Niger Coast Protectorate; Acting Consul-General, 1896-98, Oil Rivers Protectorate; in command of a Haussa company during operations in Benin country, including capture of Benin City, 1897, etc. (H. L. G.)

GAMBLE, F. W., editor of 'Junior Course of Practical Zoology,' 'Flatworms and Mesozoa,' etc. (F. W. GA.)

GANNETT, Henry; Chief Geographer U.S. Geological Survey; Chief Geographer 10th, 11th, and 12th U.S. Censuses; author of 'Idaho,' etc., in Ninth Edition of 'Ency. Brit.,' 'Dictionary of Altitudes,' 'Statistical Atlas of the U.S.,' etc. (H. G*.)

GARCKE, Emile, M.I E.E., F.S.S.; Manager of the Brush Electrical Engineering Co.; Chairman Elect. Sect. London Chamber of Commerce, 1884-88; Member of Council, Tramways and Light Railways Assoc.; author of 'Manual of Electrical Undertakings,' joint-author of 'Factory Accounts.' (E. GA.)

GARDNER, Ernest Arthur; Yates Professor of Archæology, University College, London; Director of British School of Archæology at Athens, 1887-95; author of 'Handbook of Greek Sculpture,' 'Journal of Hellenic Studies,' many articles on Greek art, archæology, and excavations, from 1882; joint-editor of the 'Journal of Hellenic Studies' since 1897. (E. GR.)

GARDNER, J. Starkie, English Iron Worker and Expert; author of 'English Enamels,' 'Ironwork,' 'Armour in England,' etc. (J. S. G.)

GARDNER, Percy, Litt.D., F.S.A.; Linc. and Merton Professor of Classical Archæology, Oxford University; Corresp. Member of the Academy of Sciences, Gottingen; Member of the Archæological Institutes of Germany, Austria, America, Greece, etc.; Assistant at British Museum, 1871; Fellow of Christ's College, Cambridge, 1872; Disney Professor of Archæology, Cambridge, 1880; editor of 'Journal of Hellenic Studies'; author of 'Corinth,' 'Ephesus,' in Ninth Edition of 'Ency. Brit.,' 'The Parthian Coinage,' 'Samos and Samian Coins,' 'Types of Greek Coins,' 'Numismatic Commentary on Pausanias,' 'New Chapters in Greek History,' 'Manual of Greek Antiquities' (with Mr. Jevons), 'Sculptured Tombs of Hellas,' etc. (P. G.)

GARNETT, Richard, LL.D., C.B.; Assistant in Library of British Museum, 1851; Superintendent of Reading Room, 1875; Keeper of Printed Books, 1890-1899; edited the British Museum Catalogue from 1881 to 1890; author of 'Alexander VI.,' 'Anthology,' 'Augustan History,' 'Byzantine Historians,' 'Chateaubriand,' 'Hazlitt,' 'Leigh Hunt,' etc., in Ninth Edition of 'Ency. Brit.,' 'Relics of Shelley,' 'Life of Carlyle,' 'Life of Emerson,' 'Twilight of the Gods,' 'Life of Milton,' 'Age of Dryden,' 'William Blake,' 'A History of Italian Literature,' 'Life of Edward Gibbon Wakefield.' (R. G.)

GARNETT, William, M.A., Hon. D.C.L. Durham; Sec. Technical Education Board, London Co. Council; Whitworth Scholar (first); Demonstrator in Physics, Cambridge; Prof. of Math., Physics and Mechanics, University Coll., Nottingham; Principal, Durham Coll. of Science, Newcastle-upon-Tyne; author of 'Dynamics,' 'Energy,' 'Evaporation,' 'Hydrometer' in the Ninth Edition of 'Ency. Brit.,' 'Elementary Dynamics,' 'Elementary Mechanics,' etc. (W. G.)

GARSTANG, Walter, M.A., F.Z.S.; late Fellow of Lincoln Coll., Oxford; Naturalist in charge of Fishery Investigations, Marine Biol.

Assoc.: delegate of H.M. Gov. to Internat. Conf. on Exploration of the Sea, Christiania, 1901; medallist of the Société Centrale d'Agriculture et de Pêche, Paris; author of numerous memoirs on Marine Biology, etc. etc. (W. GA.)

GATES, Lewis Edwards, A.B.; Assistant Professor of English, Harvard University; author of 'Selections from Jeffrey,' 'Selections from Newman,' 'Three Studies in Literature.' (L. E. G.)

GEDDIE, John; on the editorial staff of the 'Scotsman,' Edinburgh; author of 'The Water of Leith,' etc. (J. GE.)

GEIKIE, Sir Archibald, Hon. D.C.L., D.Sc., LL.D., F.R.S., F.G.S.; correspondent of Institute of France, of the Lincei, Rome, of the Academies of Berlin, Vienna, Belgium, Stockholm, Turin, Munich, Christiania, Gottingen, Acad. Leopold. Carol., Philadelphia, New York, National Academy of Sciences of United States, etc.; Director Geological Survey of Scotland, 1867; first Murchison Professor of Geology and Mineralogy, Edinburgh, 1871-82; Foreign Sec. Royal Society, 1890-94; President Geological Society, 1891-92; President British Association, 1892; Director-General Geological Survey of United Kingdom, and Director Museum of Practical Geology, London, 1882-1901; author of 'Geography' (Physical), 'Geology,' 'Hutton, James,' 'Murchison,' 'Scotland' (geology), 'Vesuvius,' in Ninth Edition of 'Ency. Brit.,' 'Memoir of Edward Forbes' (with G. Wilson), 'Geological Map of Scotland' (with Murchison), 'The Scenery of Scotland viewed in connexion with its Physical Geology,' 'Text-book of Geology,' 'New Geological Map of Scotland,' 'The Ancient Volcanoes of Britain,' etc. (A. GE.)

GIANNINI, Torquato C., State Advocate, San Marino; author of 'Laws and Decrees of the Republic of San Marino,' etc. (T. G*.)

GIBBONS, H.E. Cardinal James, Archbishop of Baltimore, U.S.; author of 'The Faith of Our Fathers,' 'Our Christian Heritage,' 'The Ambassador of Christ.' (✠ J. G.)

GIBBS, George; Consulting Engineer to the Baldwin Locomotive Works, and the Westinghouse Electric Manufacturing Co.; formerly Mechanical Engineer for the Chicago, Milwaukee, and St Paul R.R. Co.; Member Am. Soc. Mech. Engineers, and Am. Soc. Civ. Engineers. (G. GI.)

GIBSON, George Alexander, M.D., D.Sc. Edin., F.R.C.P. Edin., F.R.S. Edin.; Hon. Member Norwich Med. Chir. Soc.; Fellow and Member of many societies in England and Scotland; Physician to Royal Infirmary of Edinburgh; Lecturer on Medicine in School of Medicine of Royal Colleges; editor of the 'Edinburgh Med. Journ.' since 1896; Secretary, Royal Coll. of Physicians, Edin., 1884-94; Member of Council of the College since 1894; author of 'Physical Diagnosis' (part), 'Cheyne-Stokes Respiration,' 'Diseases of the Heart and Aorta'; editor of 'Text-Book of Medicine,' 1901. (G. A. G.)

GIFFEN, Sir Robert, K.C.B., F.R.S.; assistant editor of 'Economist,' London, 1868-76; Chief of Statistical Department, Board of Trade, 1876-82; Assistant Secretary Board of Trade, and afterwards Controller-General of Commercial, Labour, and Statistical Departments, 1882-97; President of Statistical Society, 1882-84; author of 'American Railways as Investments,' 'Stock Exchange Securities,' 'Essays in Finance,' 'The Progress of the Working Classes in the Last Half-Century,' 'The Growth of Capital,' 'The Case against Bimetallism,' etc. (R. GN.)

GILBERT, Grove Karl, A.M.; Geologist U.S. Geological Survey; author of 'Geology of the Henry Mountains,' 'Lake Bonneville,' etc. (G. K. G.)

GILES, Peter, M.A.; Fellow of Emmanuel College, Cambridge, and University Reader in Comparative Philology; late Secretary of the Cambridge Philological Society; author of 'A Short Manual of Comparative Philology,' etc. (P. GI.)

GILLESPIE, A. L.; F.R.C.P. Edin., F.R.S.E.; author of 'Natural History of Edinburgh,' 'Manual of Modern Gastric Methods,' etc. (A. L. G.)

GILMAN, Daniel Coit, LL.D.; President Carnegie Inst., Washington; President Johns Hopkins University, 1876-1901; author of 'Life of James Monroe,' 'University Problems,' etc. (D. C. G.)

GINSBURG, Benedict William, M.A., LL.D.; Secretary of the Royal Statistical Society of Great Britain; author of 'Legal Duties of Ship Masters,' etc. (B. W. G.)

GLEICHEN, Count, Albert Edward Wilfred, C.M.G., D.S.O., C.V.O.; Major Grenadier Guards; Director of Intelligence and Civil Service, Sudan Provinces; D.A.A.G., S. Africa, 1900; Nile Expedition, 1884-85; Intelligence Department, War Office, 1886-88; Mission to Abyssinia, 1897; D.A.A.G. in Intelligence Division War Office, 1898-99; served S. Africa, 1899-1900; author of 'With the Camel Corps up the Nile,' 'Armies of Europe' (translation), 'With the Mission to Menelik.' (G*.)

GOODRICH, Edwin Stephen, M.A.; Fellow of Merton College, Oxford, and Aldrichian Demonstrator of Anatomy, University Museum, Oxford. (E. S. G.)

GOODRICH, J. E., D.D.; Prof. of Latin, University of Vermont; author of 'Vermont' in Ninth Edition of 'Ency. Brit.' (J. E. G.)

GORDON, Home Seton Charles Montagu; writes for 'Victoria History Counties of England,' 'Morning Post' (London), 'The Artist,' 'Outlook,' 'County Gentleman,' 'Badminton Magazine,' etc. (H. S. C. M. G.)

GORDON, Gen. Sir John James Hood, K.C.B., Indian Staff Corps; member of the Council of India. (J. J. H. G.)

GORST, John Lowndes, C.B.; Financial Adviser to the Egyptian Government; Controller of Direct Taxes to Egyptian Government, 1890; Under-Secretary of State for Finance, 1892; Adviser to the Ministry of the Interior, 1894; Grand Cordon Order Medjidieh, 1897. (J. L. G.)

GOSCH, C. A.; attaché to the Danish Legation in Great Britain; author of 'Denmark and Germany since 1815,' 'The Nationality of Schleswig,' editor of 'Danish Arctic Expeditions 1605-1620,' etc. (C. A. G.)
